Comment: Based on the analysis and commentary presented above (item #1), it is clear that the Plan fails to adequately analyze or compare the relative costs or opportunities to preserve existing assisted housing developments in locations such as Marin County. If it had, it would have concluded that renovation and rehabilitation of existing affordable housing in Marin is of paramount importance and it financially more economical and socially equitable than building new, high density, multifamily development. In addition the Plan completely ignores this practical and economical solution and does not in any way address ways to mitigate the loss of dwelling units demolished, or lost from service. Therefore, the Plan is not in conformance with either SB375 or the Housing Element law.

#### **4 – The Plan Fails To Resolves Its “Known Controversies.”**

On page ES-11, the Plan acknowledges unresolved controversies, and continuing on page ES-12 it further acknowledges that only some of these are addressed in the Draft Environmental Impact Report (DEIR) for the Plan.

Among those not addressed in the DEIR are:

*“(1) Whether the proposed Plan’s assumptions of future land use development patterns are feasible given that MTC and ABAG cannot regulate land uses at a regional or local level. ”*

Comment: Based on the analysis and commentary presented above, the Plan fails to adequately assess whether or not the Plan’s assumptions of future land use development patterns are feasible in Marin County and other similar locations. If the Plan had considered all factors, it would have to have concluded that it single-minded promotion of high density, multifamily development would not adequately address the actual and critical affordable housing needs in Marin or similar locations, and that the development of large, high density, multifamily housing projects in Marin would be in conflict with many of the existing plans and

C156-2

Public Comment on Draft Bay Area Plan (State Clearinghouse No. 2012062029): submitted May 10, 2013 by Robert Silvestri, [REDACTED]. Mill Valley, CA 9494: Needs Not Addressed by Plan Bay Area

regulations of Marin's local jurisdiction with regard to high limits, parking requirements, zoning density regulations and local general plans. An example of this kind of "conflict" with local regulations would be the proposed Planned Development Area (PDA) in San Rafael at the Civic Center where the Plan's proposed housing density is greatly in excess of the city's general plan proposed densities. The city's general plan calls for a maximum development density of 620 units in that location that are two to three stories in height. MTC, in its grant agreement with the City of San Rafael, requires the recipient to "maximize housing," which resulted in a study by the city concluding that the general plan maximum could be raised to over 1,100 units in the PDA, despite providing no evidence of how the potential impacts would be mitigated and over the vociferous objections of the majority of residents who commented on the proposal. All public input suggests that this kind of proposed density is not economically, social or environmentally feasible, sustainable or desirable in Marin, yet there is no evidence of responsiveness to that in the Plan.

*"(2) Concerns about whether the degree and scale of growth proposed within existing communities would alter their appearance, quality of life, and affordability, and whether it would conflict with the existing plans and regulations of the local jurisdiction."*

Comment: Based on the analysis and commentary presented above, and the preponderance of public comment on the Plan, locally, it is clear that the Plan fails to adequately assess its assumptions about the impacts of the degree and scale of growth it proposes on existing communities in Marin County and other similar locations. The Plan's single-minded promotion of large scaled, high density, multifamily development will dramatically alter the appearance, quality of life, and by the Plan's own admission, the affordability of housing in all Marin communities that are typically one to three story development and generally suburban or rural in nature. In addition, the scale of development being proposed

C156-3

Public Comment on Draft Bay Area Plan (State Clearinghouse No. 2012062029): submitted May 10, 2013 by Robert Silvestri, [REDACTED] Mill Valley, CA 9494: Needs Not Addressed by Plan Bay Area

would be detrimental to the quality of life, contradicting and ignoring the requirements of SB375 to be sensitive to this outcome.

*“(3) Concerns that increased concentrations of population in focused areas would overwhelm existing public services and utilities such as parks, police and fire services, water supply, etc.”*

Comment: The types of large scaled, high density, multifamily, low income projects that are proposed and analyzed in the Plan are inconsistent with the way sustainable planning and growth can succeed in Marin County, and since low income housing projects do not pay property taxes for vital city services, the Plan places an unsustainable financial burden on Marin’s financially stretched small cities and unincorporated areas. The Plan offers no comment or solutions or financial mechanisms to assist small Marin County cities in dealing with these fiscal challenges and is therefore infeasible, as defined in SB375, and not in compliance with SB375’s requirements for an accurate assessment of these impacts, or the California State Constitution’s ban on unfunded mandates that can unfairly and without adequate compensation, financially burden cities. For example, as a result of the RHNA quota system and SB375, and as endorsed by the Plan, a proposed PDA development in the Marinwood neighborhood in San Rafael would increase primary school and middle school enrollment by more than 40 percent. This places an impossible financial burden on one community that will ultimately be detrimental to all its residents of all income levels. These types of outcomes are evidence that the Plan fails to adequately resolve or consider development impacts that will overwhelm existing public services and utilities such as parks, police and fire services, water supply, etc., as required by SB375.

#### CONCLUSIONS:

The Plan and the Plan Alternatives are not in compliance or conformance with many of the requirements of SB375 or the State Housing Element Law. Building

C156-4

C156-5

Public Comment on Draft Bay Area Plan (State Clearinghouse No. 2012062029): submitted May 10, 2013 by Robert Silvestri, [REDACTED]. Mill Valley, CA 9494: Needs Not Addressed by Plan Bay Area

more and more housing without commensurate jobs growth first, places and unsustainable financial burden on Marin County cities and unincorporated areas which can lead to potential bankruptcy for small cities (e.g. Vallejo, Modesto and San Bernadino). The Plan ignores the local land use and social, economic and physical / natural constraints in Marin County and similar locations, as required under SB375. The Plan's planning approach and skewed incentives toward large scaled TOD will contradict local efforts to promote the development of the types of affordable housing actually needed in Marin County and similar locations. If the goal of our housing laws is to provide adequate affordable housing opportunities for all income groups and particularly for those most in need (as defined in each particular location) then the Plan, as written, fails in every way to achieve that.

Examination of the Bay Area Plan and the DEIR shows that the Plan fails to satisfy the requirements of SB375 because it fails to prove that the Plan or any of the Alternatives will actually achieve the goals of providing a significant amount of housing and affordable housing for future demographic needs. The analysis presented by the Plan is neither feasible nor reasonable to achieve Marin's future housing needs, and therefore fails to conform to the requirements of SB375 and state Housing Law.

The over-riding question is why have so many mandatory provisions of SB375 and the State Housing Law, and so many considerations for feasibility, local quality of life, land constraints, economic realities and actual housing needs, been summarily ignored in the Plan's analysis and its proposals? In light of the comments and analysis noted herein, on what basis can the Plan justify its conclusions and proposals?

## **Final Comments**

Although SB375 clearly separates its requirements from mandatory conformance by local governments in creating their general plans and making

Public Comment on Draft Bay Area Plan (State Clearinghouse No. 2012062029): submitted May 10, 2013 by Robert Silvestri, [REDACTED]. Mill Valley, CA 9494: Needs Not Addressed by Plan Bay Area

local land use decisions, there is a stark difference between what is technically required and the reality created by the nexus of Housing Element Law, SB375's Sustainable Communities Strategy, the Plan, the RHNA quota process and the MTC / OBAG grant and transportation process. The Regional Transportation Plan (RTP) ("Transportation 2035" is the Bay Area's RTP and allocates funding to regional transportation) contains an internal consistency requirement. This consistency requirement impacts cities and counties because the "Metropolitan Planning Organization" (MPO – MTC and ABAG) only award funding to projects that are consistent with the "Sustainable Communities Strategy" (SCS). Therefore, the incentive for cities to receive funding - or rather the threat of being denied funding - gives local governments a good reason to draft their general plans and zoning ordinances and land use regulations in ways that are consistent with the Plan and the SCS. Combine this with the fact that under the Regional Housing Needs Allocation (RHNA), state law and the process of certification from HCD, a local government is required to amend its Housing Element and rezone its land in order to accommodate the quantity of housing it is assigned under the RHNA. So in effect local government is being required to implement major aspects of the SCS, whether or not they want to or it makes any economic sense or addresses their actual affordable housing needs, and thereby losing local control of their planning and zoning despite the provisions of SB375 that disclaim that responsibility. With this being the case, the Plan's strict conformance with all the provisions and requirements of SB375 and state Housing Law, as discussed in this comment, become even more critical.

As indicated in this comment letter, the Plan fails to conform to the requirements of SB375 in numerous areas, making its proposals and programs unsuitable for achieving the goals of that legislation for most ex-urban, suburban and rural communities impacted by the Plan in the Bay Area.

**Subject:** ABAG/MTC/County-Wide Plan totally debunked

This has been widely disseminated in Mill Valley, and has received strong citizen support, including me. From comments made publicly by Marin County Supervisors, it is clear that some, if not all, are not familiar with the proposed One Bay Area Plan in detail. With all due respect, many of us think it's time you started reading and analyzing.

Athena McEwan

> The Bay Area Plan Fails to Solve Our Affordable Housing Needs In Marin County

> By Bob Silvestri

> Posted on May 11, 2013 at 10:07 am

>

> The following letter was submitted to the Metropolitan Transportation Commission as a public comment on the Draft Bay Area Plan and its Alternatives. Please note that public comments must be submitted by no later than 4:00 PM, May 16th.

> .....

>

> INTRODUCTION

>

> Per Senate Bill 375 ("SB375"), a statutory requirement of the Sustainable Communities Strategy ("SCS") and Plan Bay Area and its Alternatives is to "house the region's projected growth by income level (very-low, low, moderate, above-moderate) without displacing current low-income residents in addition to providing adequate housing for anticipated regional growth." The Sustainable Communities Strategy requires all Metropolitan Planning Organizations (MPOs) to create transportation oriented development plans as a means of achieving those goals.

>

C157-1

> However, a review of the Draft Bay Area Plan and the Plan Alternatives (the "Plan") and the Draft Environmental Impact Report (the "DEIR") for the proposed Plan indicates that the Plan fails to adequately establish reasonably proof of its efficacy in encouraging the development of affordable housing, and in particular the types of affordable housing and community development most needed in Marin County and other similar areas in the region covered by the Plan. In fact the Plan's proposals and implementation, as conceived, will work against achieving the goals of SB375.

>

> 1 – The Plan Will Not Address Our Actual Affordable Housing Needs in Marin County or Similar Bay Area Cities and Counties.

>

> As written, the Plan will contribute to the continuing loss of existing affordable housing and it will discourage and possibly preclude the types of affordable housing and community development that are actually most needed in Marin County and by most of the Bay Area cities and counties outside of the urban core areas (San Francisco, San Jose, Oakland). Please note the following comments to support this conclusion:

>

> The Plan essentially promotes only one affordable housing and growth solution: high density, transit oriented, multifamily development. However, the Plan fails to address, consider or even acknowledge other types of housing or our real affordable housing needs in areas like Marin. Because of this, the Plan is likely to have a counterproductive effect on that type of development needed most in most ex-urban, suburban and rural communities covered by the Bay Area Plan.

>

> The analysis that follows will show that rather than simply counting units, as the RHNA does, the Plan needs to analyze and facilitate the types of housing that are actually needed in each prototypical community in order to achieve its goals. For the purposes of this comment "prototypical community" is defined as each different type of community development pattern that is found in the nine county Bay Area, which will be impacted by the Plan.

>

> Definitions used in this analysis:

>

> "Urban" (San Francisco, San Jose, Oakland): Areas that have fully developed high density housing and public transportation systems in place.

>

> "Ex-urban" (Walnut Creek, Burlingame, Berkeley): Areas that have a mix of developed high density housing and some significant public transportation systems in place (e.g. BART).

>

> "Suburban" (Marin County cities, Danville, Saratoga): Areas that do not have significant high density housing development or significant public transportation systems in place and are unlikely to have significant public transportation systems in place in the foreseeable future.

>

> "Rural" (West Marin and many parts of Napa and Sonoma counties): Areas that have no high density housing development or significant public transportation systems in place and will not have significant public transportation systems in place in the foreseeable future.

>

> Marin County Suburban / Rural Example:

>

> Examination of the affordable housing needs of Marin County cities and its unincorporated areas results in a list of housing types that are not recognized or acknowledged by the Plan. Most of the actual affordable housing "opportunity sites" in small Marin communities are found in smaller, infill locations and not in larger land parcels located near our major freeway, Route 101 (the only actual transportation corridor in Marin

## Plan Bay Area 2040 Final Environmental Impact Report

County). This creates a disconnect between the solutions envisioned by the Plan and the reality that our county and cities have to work with when addressing the Regional Housing Needs Assessment quotas as prescribed in their Housing Elements.

>

> Infill and mixed-use, infill development opportunities will not benefit in any way from the methods or transportation oriented investments prescribed by the Plan.

>

> Furthermore, in most Marin communities, social, economic and demographic trends show that there are significant under-served populations that need different types of affordable housing than the high density, multifamily housing contemplated by the Plan. However, every one of the types of housing described hereunder and the low income residents who need them will not benefit from any types of support, subsidy or investment noted in the Plan.

>

> The types of housing needed in Marin County that are not supported or promoted by the Plan include:

>

> Low income housing integrated into existing communities: These would predominately include, small scaled, low density, mixed use, retail and residential, and stand-alone duplex, triplex and fourplex housing. These represent the vast majority of housing growth opportunity sites in Marin.

>

> Housing for the elderly and assisted living facilities: A rapidly growing need, these would include a variety of types that are either not addressed by the Plan or not recognized by RHNA as qualifying units.

>

> Housing for people with disabilities and special medical needs: This is a growing need that remains under-served. In light of well accepted data on health and pollution, it is not recommended that this demographic group live in proximity to major highways or other sources of air pollution. So even if multifamily housing was developed according to the guidelines on the Plan, it would be putting this population in harm's way. Please also note that this correlation between proximity to freeways or major rails lines (e.g. Marin's SMART train) also applies to anyone suffering from emphysema, asthma, heart conditions, cancer or other serious illnesses, and there is growing evidence that there is also a correlation with instances of autism.

>

> Homeless shelters and abused women's safe houses: This is another area where housing need is increasing that is under-served and largely unrecognized by the RHNA quota system since almost all shelters are communal living. This is an instance where Housing Element law and the RHNA quota system are in conflict with SB375, a conflict that remains unresolved in the Plan. In addition, shelters and safe house facilities are most advantageously located within existing communities, which in the case of Marin means they will not be in direct proximity to Highway 101 or significant public transportation, and not best suited for transportation oriented development.

>

> Live/work opportunities such as lofts and cooperative housing: There is an increasing demand and need for live / work housing opportunities and housing for those choosing or requiring alternative lifestyles. These units are typically only partially or sparsely finished and therefore by definition generally more affordable. The opportunities for these types of projects are typically on marginal land near suburban downtowns where there is little public transportation besides occasional bus routes.

>

> Co-housing: Co-housing may be one of the biggest emerging trends in housing that is likely to impact the types of housing built over the next 20 years, particularly in places like Marin County. In these situations residents design and/or operate their own housing solutions (typically a hybrid of multifamily, townhome and zero lot, single family homes) and share common grounds, supporting recreational facilities or gardens, and often communal cooking / kitchens and dining areas. It is also typically moderate density development. Ownership is either fee simple or a form of condominium or both. This very important housing type has significant advantages because it frees up larger existing housing (as older residents downsize and move to smaller co-housing), it conserves land use, reducing auto use for socializing, and is generally less energy intensive. However, under RHNA and therefore the Plan, the way units are "counted" against the RHNA quota, a 35 unit project with a communal kitchen would be counted as one living unit of housing. This would discourage any city from assisting in this type of development. In addition, these kinds of projects are almost always in suburban or rural locations which are preferred by the owner/developers. The Plan, as it is written, with its emphasis on transit oriented development, actually discourages this important housing trend. Some examples of co-housing applications include communities for active seniors, migrant and seasonal worker housing, homeless and family transition housing, young singles housing and micro unit complexes.

>

> Apartment building preservation, reconfiguration and substantial rehabilitation: Renovation and rehabilitation of existing market rate, affordable housing projects is probably the biggest need and the biggest impact opportunity in Marin County in terms of preserving communities, allowing existing affordable housing residents to remain in place, and improving the lives of those most in need of assistance (a required criteria under SB375). This is in evidence in areas such as the Canal District in San Rafael and Marin City. However, as written, the Plan does not in any way acknowledge or encourage this need. To continue to promote the construction of new, highly impactful, high density projects while allowing existing affordable housing to fall into disrepair or worse, disuse, makes no social or economic sense whatsoever.

>

> Prevent the Loss of existing public affordable housing: A related category of affordable housing need would include existing public housing units that are falling out of service due to the expiration of Housing Assistance Payments (HAP) Contracts, loss of economic use due to aging structures and too much deferred maintenance, or the voluntary withdrawal from the Section 8 program by the landlords. This is true throughout Marin and is evidenced by Marin County Housing Authority historical records. The annual loss of units in this category is a significant public housing problem in Marin and other Bay Area counties that the Plan does not address or acknowledge. The lack of federal or state funding (subsidies, tax credits or other financial incentives) to support the preservation of this essential affordable housing stock adds to the problem. Again, for the Plan to promote the construction of new, high impactful, high density projects while allowing existing affordable housing to fall into disrepair or worse, disuse, is a waste of public funds and makes no social or economic sense whatsoever.

>

> Building conversions from commercial to mixed use residential: Another major affordable housing opportunity throughout Marin, and places like it, are existing structures that lend themselves to conversion to residential and residential mixed use (commercial or retail) redevelopment. The Plan's single minded proposal to support only the development of new, high density, transit oriented development, ignores more economical and socially beneficial solutions.

>

> Sweat equity opportunities: The implementation of deed restricted, for sale housing as a sustainable affordable housing solution has been discredited over the past decades in many cities where it's been attempted (e.g. San Francisco). Deed restriction on for sale housing amounts to nothing more than a form of indentured servitude that is contrary to why anyone buys a home (for equity appreciation). Similar to the "live / work" opportunities described above, a better solution is "sweat equity" opportunities where low income owners can attain ownership or co-ownership with an equity partner, who they will share the appreciation upside with, or have the opportunity to pay off their equity partner / lender (equity plus interest) upon resale. However, they still get to directly benefit from the rewards of ownership and their hard work to improve and maintain their home. This method is effective for either new housing or existing housing purchase programs. However, because it does not generally create new housing units, it is ignored by RHNA and consequently ignored by the Plan.

>

> Very small starter rental and condo units: These include housing for singles, single parent households and young couples, often called "micro units," and is another emerging housing type. However, in Marin, this again lends itself more to smaller scaled, infill, mixed use development that is atypical, both in location and proximity to significant public transportation options, than what is supported, analyzed and promoted by the Plan.

**Subject:** concerns on One Bay Area....DEIR comments

Dear County Advisors....I have great concerns about issues that are not being discussed or allowed to be discussed in public forums.

They are:

C158-1

- Unrealistic job and housing numbers
- Inadequate evidence that high density housing near transit reduces green house gases (GHG)
- Inadequate evidence that the transportation plan reduces GHG
- Evidence that this plan increases costs for housing and transportation among low-income households
- Inadequate information re: water supply, sea level rise, and support for infrastructure
- 5 significant, irreversible environmental changes and 39 significant unavoidable impacts of the plan, identified in the EIR, should not be dismissed with findings of "overriding consideration."

I would appreciate a response and inclusion of this comment e-mail in your staff summary report

Thank you, B Brookins

**Subject:** Re: concerns on One Bay Area....DEIR comments

Hi Barbara,

Thank you for your interest in this issue. I wish you had come and spoke at City Council like some other members of the public. We made some comments on the draft EIR that are being presented from the city. I have attended two public hearings and the TAM meeting for Plan Bay Area ( seven hours almost as long as the longest planning commission meeting I attended) as well as the sustainable communities sub committee for Marin that I am a member of. I can tell you by and large no body is supporting this plan as is. All those comments will need to be addressed before anything moves forward. Some very basic and real issues have not been touched on, like the planned development in flood plains, the unrealistic growth projections, as well as the issue I raised, which is our limited water resources in Marin, we hardly have enough for our current population let alone and increase of 700,000, the current size of San Francisco.

I am very impressed you were able to get all of the EIR read in such a short time, I did not get through it, and have had to rely on many people smarter than me to explain what is going on so your input is greatly appreciated

Very Best,

James

## Plan Bay Area 2040 Final Environmental Impact Report

**From:** Kathi Ellick <[REDACTED]>  
**To:** <info@OneBayArea.org>  
**Date:** 5/17/2013 8:11 AM  
**Subject:** DEIR

I have just heard about the possible planning changes for the Los Ranchitos Area.  
I would like to submit my comments regarding this proposal

**C160-1** First of all, I would like to request an extension of the deadline for comments. I live in NY and depend on email contact. I didn't have time to respond until now.

The following points are important to review when presenting this proposal for Los Ranchitos:

There will be significant environmental changes and significant impacts that the EIR points out.

**C160-2** The proposal doesn't have a realistic job and housing numbers..These numbers that are imposed by the state , show inadequate evidence that high density housing near transit reduces green house gases.

**C160-3** There is inadequate evidence that the transportation plan reduces Green House Gases.

**C160-4** This plan increases costs for housing and transportation among low income households.

**C160-5** There is inadequate information about the water supply and how that will be impacted.

I'm sorry that I wasn't able to attend any meetings.

Kathi Ellick

## Plan Bay Area 2040 Final Environmental Impact Report

**From:** Ronette King [REDACTED] >  
**To:** <info@onebayarea.org>  
**CC:** <sadams@marincounty.org>, <leyla.hill@gmail.com>, <skinssey@marincounty.org>, <krice@co.marin.ca.us>, <und@novato.org>  
**Date:** 5/16/2013 3:24 PM  
**Subject:** DEIR and SEIR

Dear Sirs,

I am a resident of Los Ranchitos .

Please see my comments below for both the DEIR and the SEIR .

**C161-1** Both of these reports are dense and enormous reading requiring far more time than the county has given us to understand them. In both cases I believe we need an adequate extension on there deadline.

**C161-1.5** It is very upsetting that no residents of Los Ranchitos were given any notice that their neighborhood was being considered for rezoning. Any densification of part of it affects all of it.

This is a peaceful, natural setting that was designed to offer a unique country setting free of the problems of dense housing. It's country way of life is one of a kind in Marin and is exactly what attracted us to buying here twenty years ago. Densifying los Ranchitos would destroy the last vestiges of what Marin County was meant to be.

As a former Design Review Board member for Larkspur, I am well aware of what the 30 units of housing per acre can look like...the opposite of our open, and natural setting! It will be a physical closure along Los Ranchitos facing the railroad tracks. The environmental impacts are a huge concern and will be for this entire neighborhood. This is to say nothing of the unpleasant bicycling, walking, and driving experience that los Ranchitos will provide..

**C161-2** Re the Plan Bay Area : The job and housing numbers imposed by California are unrealistic for our area. There is no huge jump in job growth here and hypothetical job growth is contingent on a wide variety of factors. There also is no adequate evidence that high density housing near public transit reduces greenhouse gasses.

**C161-3** This plan may increase costs for housing and transportation among low-income housing and there is insufficient information on environmental issues such as water supply and general support for infrastructure.

**C161-4** In all, there are significant environmental changes and unavoidable impacts of the plan identified in the EIR, that should be addressed regardless of findings of overriding considerations. With these proposals for such heavy density there is a lot to be damaged and irreversibly spoiled for us all.

Sincerely,

Ronette King

## Plan Bay Area 2040 Final Environmental Impact Report

**From:** <JLucas1099[REDACTED]>  
**To:** <info@OneBayArea.org>  
**Date:** 5/21/2013 12:01 PM  
**Subject:** Draft EIR Plan Bay Area -April 2013 - SCH #2012062029

Association of Bay Area Governments  
Metropolitan Transportation Commission  
May 21, 2013

RE: SCH #2012062029 DEIR Plan Bay Area

Dear Commissioners,

Afraid I am no longer as adept at bean counting as I once was. In short am having trouble coordinating all the prospective project RTP ID contract numbers with affected locales, streams, wetlands and physical features.

**C162-1** My rough estimate is that affected streams, Waters of the US and wetlands constitute double the acreage allotted in this DEIR, though am still struggling to cite chapter and verse, and that there is no way ABAG and MTC can find commensurate mitigation habitat to compensate loss for Santa Clara County species affected.

Over past decades have witnessed irreversible impacts that your projects have had on anadromous fisheries and wetlands and ultimately have observed that mitigation sites have fallen into degraded, dysfunctional plots. Phone call queries to VTA and CalTrans are absorbed into the ether.

**C162-2** However, more basic still to Plan Bay Area is the vague or overblown assessment of water resources that are now or that will be available to Bay Area populations. Most of region's water supply lines and reservoirs are either adjacent to or on earthquake faults, and underground aquifers are equally susceptible to quake alteration along extensive foothills of the Santa Cruz Mountain Range.

PUC has attempted to place realistic caps on amounts of water supply that their customers can expect to receive and believe your plan needs to reflect such constraints. Calaveras Dam upgrade has encountered a problem with landslides so its ultimate capacity may fall short of expectations. San Francisco's reservoir system along San Andreas fault stood up admirably in Loma Prieta quake but quakes do differ dramatically.

**C162-3** In regards the diminished Sierra snow pack, this year may be only the forerunner of a drought cycle. Birds of the Pacific Flyway may be able to alter their migratory routes somewhat to survive unfavorable conditions in their food supply grasslands and marshes, but to move Bay Area human populations east to Missouri for a summer is not really an option. In short, do believe your population projections are overloading the camel.

**C162-4** At other end of the water issue is global warming with its attendant rise in ocean levels and storm intensity. Do not feel this element of inherent constraints of our San Francisco Bay Estuary is incorporated in highway upgrade priorities or in protection of future resident population densities. Where are updated FEMA maps? Shouldn't Highways #237 and #37 be upgraded as causeways above inevitable floodplains?

**C162-5** Considering the two dozen streams that your projects intercept in Santa Clara County, believe any increase in storm intensity and stream flows must alter hydrology, setback levees and the depth of riparian corridors. As believe may have stated earlier, you should be considering canals not clover leaves. Source of this thought is that when breached Guadalupe River levee emptied into underpass of #87 it saved downtown San Jose from more severe flooding. These contingencies are hard to plan for but should be at least a consideration.

In short, guess can only say that believe this plan is focused on retro housekeeping rather than realistically planning for future. Might add that extent of limits of our society in keeping up infrastructure is commented on in recent news items in SF Chronicle "tawdry ruination of terminals that make up New York's LaGuardia...and then to drive into Manhattan over

potholed highways, past shoulders cluttered with trash and weeds, under bridges  
bristling with tangles of rusty rebar protruding from crumbling concrete  
hardly inspires confidence in our ongoing prowess." and "Bits of the old  
"Medea" cling to the rising waters of a climate change challenged new  
world"...Believe this is not just literary hyperbole but public consciousness of  
reality.

C162-6

And then, in Palo Alto's Daily Post yesterday's headline reports 'Traffic  
mayhem' showdown in City Council meeting as 'Residents fight project that  
they fear will make streets even more unsafe'. With this in mind I would  
question wisdom of Project #240506 which widens El Camino Real adjacent to Palo  
Alto High School where countless students cross over to Town & Country  
Village for lunch and residents to Stanford athletic events and #21787 that  
enlarges CalTrain/Bus Transit Center at expense of parkland and Sequoia  
grove.

C162-7

Quality of life, and neighborhoods with safe walking and cycling streets  
are of equal importance as regional concerns for commute traffic gridlock,  
if not more so. One Bay Area Plan needs consider that bigger is not better  
and certainly is not cheaper. (ie.HOV lanes are more democratic than pay as  
you go express lanes?)

Will transmit this now and hopefully appendices charts and comments will  
follow by regular mail today.

Libby Lucas

Los Altos, CA 94022

PS: Might mention that once was sent to interview Robert Moses on what  
happened to 16 golf courses that used to be found in and around Manhattan and  
he described how each was needed for highways, shopping centers etc. Believe  
was supposed to generate a humorous piece but was never able to put pen to  
paper, as it made me so sad. This is why hope you can appreciate Chronicle  
article on defunct Long Island highways.

San Jose, CA

May 16, 2013

MTC

Carolyn Clevenger

101 Eighth Street

Oakland, California 94607

Dear Ms. Clevenger:

I am writing in regards to the Plan Bay Area Draft EIR, specifically on air quality impacts.

I have the following questions:

- C163-1 1. Where in the air quality analysis does the DEIR include Children's Environmental Health Protection Act (Senate Bill 25, Escutia, Chapter 731, Statutes of 1999, Health and Safety Code Sections 39669.5 et seq.)?
- C163-2 2. In the DEIR, page 2.2-82: "According to BAAQMD, the dispersion modeling for San José is anticipated to be completed in spring 2013. ..."Where a proposed project is consistent with an adopted CRRP, the impact would be less than significant (LS)."
  - a. Please provide an updated timeline for the City of San Jose's CRRP?
  - b. In addition, can you please provide impact analysis if the City of San Jose does not complete the CRRP or approved by decision-makers. What would be the significance levels without a CRRP?
- C163-3 3. Can the DEIR include a detailed environmental air quality setting for each county or at least for cities requiring a CRRP? Does this include the various topographical regions and microclimates? Many local jurisdictions lack the technical expertise in air quality to adequately review the magnitude of change from the existing environmental setting.
- C163-4 4. Can the DEIR include a summary table of health outcome from various air pollutants and sources such as shown on CA Air Resources Board's website <http://www.arb.ca.gov/research/health/fs/fs1/fs1.htm> ?
- C163-5 5. Where and to whom can the public contact with air quality and health questions for proposed projects? Which public health departments or other responsible agencies?
- C163-6 6. Can you please provide an impact analysis and explanation for **each** of the "Figures 2.2-4 through 2.2-21 which show GIS spatial analysis (p. 2.2-40). "In general, the figures show that areas over the threshold tend to occur along high traffic....." One sentence is inadequate to explain 17 maps and lacks rigor.
- C163-7 7. Appendix E: Air Quality Analysis Methodology: GIS Cumulative Analysis p. E-11. Can you please provide a full disclosure instead of only providing two paragraphs? Please document the rigor of the scientific methods: the factors, years, where the data was obtained, etc..

- C163-8 8. Why did the DIER not include a Health Impact Assessment? Can you include the California Communities Environmental Health Screening Tool  
<http://oehha.ca.gov/ej/ces042313.html>?
- C163-9 9. Can you please include “**Environmental Justice at the Local and Regional Level Legal Background**” and how these laws are applicable to this DEIR?  
<http://oag.ca.gov/environment/ceqa/planning>  
[http://oag.ca.gov/sites/all/files/agweb/pdfs/environment/ej\\_fact\\_sheet.pdf](http://oag.ca.gov/sites/all/files/agweb/pdfs/environment/ej_fact_sheet.pdf)
- C163-10 10. Can you please include climate change’s unequal impacts applicable to this DEIR?  
<http://oag.ca.gov/environment/climate-change/unequal-impacts>

Thank you,

Ada E. Márquez

## One Bay Area Plan - Comments on the Draft EIR

To all concerned

Did you know that the City of Berkeley had only a compact disk and no hard copy of the Plan Bay Areaa draft EIR in its Main Library for the people of Berkeley

The disk it difficult to read for this huge EIR as most readers would need to look back and forth at charts, maps, legal concepts, and definitions of the many uncommon acronyms.

I only heard about this PBA EIR document “through the grapevine” from an Albany resident last Thursday! .Since then I have talked to some 20 Berkeley activists, most who knew nothing about this very important subject. Some residents agreed to look at this (draft) EIR and try to comment on a topic. But most of these people, possibly all, have given up, confused by the all strange acrnymys, concepts, and the volume of this 1300 page report on line! This project need to be recirculated,advertised and comment period extended for avery reasonablelength of ltime.

My question to you is - How come not one of those community leaders mentioned above, and from all over Berkeley - East, West- North, South and Central, had a clue about this Plan and deadline?

Berkeley is known all over the world as a city that cares and we certainly care about the environment and protection of our planet from Global Warming.

---

## Comments on the EIR

- 1.) I have a concern re your definition ( in your draft EIR Glossary) and your strategy for taxing VMT (Vehicle Miles Traveled) in Berkeley and other similar cities.

The glossary definition -

says essentially that the VMT tax on Berkeley’s taxpayers will include charges for ALL cars entering and exiting the City of Berkeley. This therefore means the VMT tax will count cars that enter and exit Berkeley to visit, work at, or attend the University and The LABS, although the University will NOT be responsible for their share of this bill because the University is considered separate from Berkeley proper! So Berkeleyans will pay for the University and LABS share of cars entering and exiting Berkeley. And think about it, we do that already for road maintenance and more, much of the time.

And this tax on Berkeley citizens will continue to grow as UC and The Labs grow in population of commuters and visitors.

Furthermore, because Berkeley taxpayers have been steadily losing their parking lots and spaces in the city under city policies for the last 10 years, and often residents are ticketed with steep fines, those that must or choose to drive are being discouraged from shopping in Berkeley and are therefore encouraged to drive elsewhere where parking is easier for

shopping. But this increases driving and GHG and therefore the VMT taxes. as residents must drive in and out of Berkeley. This is not helping the GHG situation but making it ridiculous and worse.

Berkeley's parking strategy for residents (TDM— another little known acronym) deliberately eliminates resident parking and or makes it difficult for residents. But the TDM strategies remove resident parking while letting UC Berkeley which has over 6000 –some parking spaces of their own and yet is taking over and using more and more city of Berkeley parking, land, and buildings. This encourages UC vehicles to commute or visit UC via driving into Berkeley, and this encourages GHG and pollution, traffic jams and accidents in Berkeley. including danger to pedestrians, bikers.

Furthermore UC businesses rarely use restaurants, theaters, music and arts venue that residents patronize as UC has their own food services and entertainment. So as residents parking is steadily decreased and UCB is taking much of it (see CCTimes April 18 2013) residents will lose their movie theaters and favorite places, and quality of life. Already the promised Library Parking, validated parking for residents who pay a huge library tax every year, has been “forgotten”. The strategy we see here taxes residents increasingly while taking pools (2), schools (many), senior centers ((2), and so on, cumulatively and lets the University off the hook.

Meanwhile the walkability of our walkable green city is being increasingly paved and degraded, which causes Global Warming, but the paving over, cutting trees, shadowing and blocking cooling winds from existing buildings causes need for more heating and cooling causing more GHG from increased use of gas and electric.

C164-3

2.) The Transportation strategy that concentrates big buses on main corridors.

and to be used for transportation for “the historically disadvantaged”. Buses on smaller streets will be eliminated. This will hurt hill residents and folks like seniors and disabled students and those who do not live near bus stops. Those who are forced or encouraged to drive will increase our GHG. They exit and reenter the city and increase our Carbon Tax. “The historically disadvantaged”. will live, work, and wait for buses on diesel polluted corridors getting disproportionately very high rates of asthma and illness.

C164-4

3.) PCD

Have been refused in Berkeley because Developers want the land-

A.) Strawberry Canyon ecol Study Area wildlife riparian Lenert A corridor between parks trees and grasslands sucking C and GHG etc from air fresh ox cooling planet providing habitat for endangered species. UCB wants to develop huge energy consuming polluting where they

--B.)

Berkeley Waterfront Fishing Peer oysters burrowing owls bird flyway gentle nonpolluting water activities like wind surfing, sail boating Shorebird Park, his Lordship

City wants polluting diesel ferry which triggers cars galore huge parking paving, eliminating landscaping. If we are serious about preventing Global Warming we need to protect the Bay and landscaping. SF Bay is one of 5 huge estuaries on earth that have shallow sunlit water so when healthy the plankton are sucking Carbon from the air and releasing pure oxygen. The oysters the birds the gentle uses are good. Paving the earth and construction for diesel ferries and LBNL and other labs harm We can have a solar hydroplane ferry docking at existing facilities that will minimize damage to the environment.

Why has ABAG etc refused PCA and bay protection

Deals for developers: the University and the LBNL have huge earth paving water polluting Labs housing and office they are no invested in saving the earth the Bay and our Planet. Marshland healthy estuary prevents sea level rising. Transit Village

C164-5

3.) Priority Conservation Areas: Berkeley's Avenues such as main corridors like S P, U Ave Shattuck are all designated PDA which allows for massive development and Streamlining CEQA—under this Plan (SB 375-) this will potentially and incrementally destroy our beautiful historical landmarks as well as beautiful mature trees , which actually suck CO2 , methane and pollutants out of the polluted air an thy release pure fresh oxygen.

Since 35% of global warming gases are created by new construction—making cement , alumni windows etc

The demo and const causes badly polluted air

The tall buildings block sunshine and cooling breezes causing people to use more energy (natural gas and electricity with Gigs) to warm and cool their homes

What is gained green money in the pockets of developer, kickbacks to powers-that-be. Big Corp, Big buildings, Big buses, and a ruined planet Earth.

## COMMENTS ON THE PLAN BAY AREA (SCS) DEIR, May 2013

- C165-1** | Some results in the Plan Bay Area DEIR are implausible. For example, it predicts a drop of over 90% in the growth rate of bicycling that we currently observe. This and other anomalies undermine confidence in the DEIR results and conclusions.
- C165-2** | The San Francisco MTA (Metropolitan Transportation Agency) reports a 71% increase in bicycling over the last five years, a growth rate well over 10% per year. The DEIR (Table 2.1-13) forecasts that, commencing in 2010, bicycle trips would increase only 60% over 30 years. Half of that increase can be ascribed to a greater population. Absent the effect of population, the growth rate would be about 1%. The DEIR does not address the sudden collapse in cycling growth rate. Similarly, despite the observed decrease in driving by millennials and the SCS emphasis on PDAs, walking trips would only grow at 1%.
- C165-3** | SB 375 anticipates that the SCS would shift trips from carbon-powered vehicles to modes that produce little or no GHG. Yet, under the proposed plan, observed shifts from driving to pedestrian and bicycle modes would practically cease, and would not resume. These are not credible outcomes. Perhaps the PDAs do not perform as hoped or the model is flawed. Whatever the case, we are prompted to ask what other DEIR results are questionable. In particular, are the carbon-dependent, driving numbers credible?
- C165-4** | The proposed plan includes numerous highway capacity expansions (Table 2.1-11). The text implies that these are inconsequential. The numbers tell a different story. Enough pavement would be laid to construct a two-lane highway from San Jose to Los Angeles. This would be a significant investment in travel by automobile.
- C165-5** | The increased capacity would invite more driving. Peer-reviewed studies show that capacity expansion facilitates land development and induces new traffic (latent demand). The pattern is consistent among metropolitan areas. The induced traffic means more VMT and more GHG. If the DEIR neglects induced traffic, its results for *Drive Alone* and *Carpooling* are not credible. They underestimate generation of GHG.
- C165-6** | The impact on VMT and GHG of each highway expansion project should be scrutinized with a focus on induced traffic. Since environmental consequences are independent of traffic origins, the scrutiny must extend beyond the Bay Area counties. According to the DEIR, the current model does not do so. Nor does it take into account the recently observed flat or downward trend of driving throughout the United States.

If re-examination of the highway projects confirms excessive GHG growth, designation of the proposed plan as the preferred alternative should be reconsidered.

Respectfully submitted,

Robert R. Piper, PhD

*Re: Comments on ABAG's and MTC's Draft Plan Bay Area and Environmental Impact Report Plan Bay Area Draft*

Dear Sirs:

On behalf of Bay Area Citizens, I am pleased to submit: *A Population Forecast – The San Francisco Bay Area*, May 2013, prepared by Beacon Economics, attached.

This letter, and the Beacon Economics report, shall be included as comments on the Association of Bay Area Governments' (ABAG) and the Metropolitan Transportation Commission's (MTC) *Draft Plan Bay Area (Plan)*, March 2013, and *Environmental Impact Report Plan Bay Area Draft* (DEIR), April 2013, State Clearinghouse No. 2012062029.

C166-1

We at Bay Area Citizens have been concerned that population projections of the *Plan* and DEIR for 2040 appeared quite high to us. Since population projections have very significant impacts on many important elements of the *Plan* and DEIR, we asked Beacon Economics (Beacon) to perform an independent, unbiased analysis of the methodology utilized by the demographic consultant to ABAG who prepared the projection, with particular attention devoted to the projection of Bay Area jobs, which is one of the key drivers of such projections, particularly in the case of the projection utilized by ABAG's consultant in its 2040 projection. We also tasked Beacon with developing its own Bay Area 2040 population projection and with collecting and reporting projections made by other reputable entities that have prepared Bay Area population projections for 2040.

As documented in their report, Beacon does not concur with important aspects of the methodology utilized by ABAG's consultant. Its own 2040 population projection was significantly lower than that utilized by ABAG and MTC in the *Plan* and DEIR.

What is perhaps the most important finding of the report for the current purposes is that four entities, very experienced in making such projections, Beacon, the State of California Department of Finance, Caltrans, and IHS Global Insight, have projected Bay Area population growth to 2040 between 1.283 and 1.695 million, while the ABAG projection is growth of 2.077

**Comments on ABAG's and MTC's Draft Plan Bay Area and Environmental Impact Report**  
**Plan Bay Area Draft** **Page 2**

million to that date – 39% higher than the simple average of the four other projections, 1.499 million. The ABAG consultant's projection is the outlier, and by a considerable margin

From the Beacon report, and the other population projections prepared by other independent experts, we conclude:

- C166-2 1. The ABAG jobs and population projection are significantly higher than the range of estimates from well-recognized authorities.
- C166-3 2. Projecting significantly more jobs, and more people, than is likely to actually occur means more travel, than is likely to occur – and the vast majority of this extra travel will be taken on non-transit motor vehicles (expressed in Vehicle Miles Travelled [VMT]), resulting in a significant over-projection of the likely level of VMT in the Bay Area in 2040.
- C166-4 3. This resulting unwarranted over-projection of VMT will cause CO<sub>2</sub> and other emissions to appear to increase more than proportionally than the over-projected VMT because, as VMT increases and approaches and exceed road capacity, congestion increases rapidly, which significantly increases energy usage and all emissions per VMT.
- C166-5 4. Therefore, the over-projection of job and population growth in the *Plan* and DEIR results in significantly over-stated CO<sub>2</sub> and other emissions in the 2040 projection year. Since this outcome is not based on the best scientific knowledge and analysis, it must be rejected, and replaced by projections based on mainstream consensus.
- C166-6 5. Further, by overestimating population growth, the *Plan* and DEIR over-estimate household formation and the demand for new residences; this in turn means that the requirement for 80% of new residential units to be in PDA's will mean more PDA housing units being created and more people living in them, this will further detract from the utility of the outcomes of the land use and transportation model runs created as part of the preparation of the *Plan* and DEIR.

I have reviewed "Overview of the Regional Housing Need Determination, DOF Population Projections and Plan Bay Area Forecast," prepared by the California Housing and Community Development Department (HCD), the California Department of Finance (DOF), and the Association of Bay Area Governments (ABAG). This is a most strange document and includes a number of statements I find objectionable, including (my comments in ***bold italics***):

1. "HCD, DOF and ABAG agree that economic trends need to be addressed in Plan Bay Area. ABAG's 2.1 million population growth projection is directly tied to employment growth."

C166-7 ***Agreed that ABAG's projection is directly tied to employment growth, and that is our major concern, as it appears that ABAG's projection is tied to an over-projection of such employment growth that we believe is very unlikely to occur.***

2. "DOF's 2013 projections do not take into account the high job, migration, and population growth from 2010 to 2012."

C166-8

*Two years a long-term trend do not make – particularly as these two years can be very fairly considered, in large part, as a recovery from a long period of very slow growth, and as largely a sharp, though only partial, rebound from the 290,000 jobs lost in the Bay Area in the preceding three years from 2008-2010. Proper economic projection procedure is to consider the 2010-2012 period, but as part of the longer term context. No competent economist or demographer would ever base a 27-year (2013 to 2040) projection on two years of history – it should be a factor, of course, but not a controlling one. Short-term trends can change very quickly – such as how the trend from 2008 to 2010 changed radically to that from 2010 to 2012. Any projection that assumes that a short-term trend will continue forever into the long-term should be discarded as flawed on its face.*

C166-9

3. "The DOF population projections depict only one possible course of future population change, i.e., the one reflecting assumed trends in fertility, mortality, and migration. The model does not consider employment, which is a major driver of migration. Thus, it is not a forecast of the most likely outcome. These projections do not necessarily show what is most desirable but rather what can be reasonably expected if recent historical trends continue until the year 2060."

*While it is certainly agreed that employment is a factor, the ABAG assumptions, including that the Bay Area has a permanent and inviolate advantage in technology that will assure that it always will have job growth higher than the national average, is highly questionable, for the following reasons:*

- *First, such advantages are fleeting, as plants, offices, and laboratories can and do relocate over time – including as new businesses in new areas learn to compete – and often win – over established technologies and companies and as newer technologies, and entire industries, move to the forefront.*
- *Second, California and the Bay Area are very vulnerable to loss of jobs, as we are consistently rated as one of, if not the, least business friendly states and regions in the nation.*
- *Third, we have very high taxes on both businesses and individuals, which tends to drive both established businesses and the start-ups that are so critical to job growth to places with lower taxes.*
- *Fourth, our cost of living is very high, which makes it more difficult for businesses to attract the high-quality people they need because the recruits find the cost of housing so high they cannot afford the type of housing they, and their family members, prefer (and the concept that this will be addressed by forcing the production of less preferred types of housing and changing consumer demand should not be accepted without significant reflection on the ability of governments to change consumer behavior by fiat).*

- *And Fifth, and perhaps most tellingly, the ABAG population forecast is based upon the subsidiary assumption that jobs will grow in the Bay Area at much faster rates over the next three decades than jobs have grown in the Bay Area over the past two decades because the Bay Area will take share of national jobs because of its comparative advantage in technology relative to the rest of the country. But ABAG cannot satisfactorily explain how the next three decades will be so different than the past two decades—a period in which the Bay Area indisputably had the comparative advantage in technology that ABAG projects will persist over the next three decades, and yet job growth was sluggish and the Bay Area lost share of national jobs during the past two decades.*

*The one explanation we've heard for why "this time it's different" and why the sluggish job growth over the past two decades is not predictive of the future is that the Bay Area saw three recessions over the past two decades. Recessions of course are an inevitable part of the economic cycle, but this rationale is perhaps why the Plan itself states on p. 31 as the first, and presumably most important of its economic assumptions that [t]he Bay Area and national economies will be healthy, with an average unemployment rate of 5 percent or less. A thirty year economic forecast without any major recessions is an appealing and hopeful outlook indeed, and certainly supportive of ABAG's population model which assumes outsized growth in jobs over the next thirty years, much greater than that over the past twenty years, but perhaps such an assumption may be a bit untethered to historical experience to underlie the population and economic forecasts of a regional plan with as many consequences and implications as Plan Bay Area.*

*While the DOF population projection may not be "the most likely outcome," there is no reason to believe that the ABAG projection will prove superior; in fact, it appears to be an outlier from the economic/demographic mainstream. We have not noted that DOF has admitted that its projection is incorrect and will be revised. Although it is highly unlikely we will ever get an answer to this question, we do wonder how much of this document was the outcome of professional discussion and how much was the result of political pressure.*

4. "Job growth is the main determinant of population growth in the ABAG regional growth forecast as in all major regional forecast modeling in California and around the nation. ABAG job growth to 2040 is estimated as a share of U.S. projected job growth, based on an assessment of regional competitiveness by major industry sectors."

C166-10

*While we do agree that "job growth is the main determinant of population growth in the ABAG regional growth forecast," we do not agree that it is the same "in all major regional forecast modeling in California and around the nation." Yes, it is almost always a major factor, but there are many other major factors commonly utilized, including "natural" population change (births and deaths). In California over the past few decades, the major*

*reduction in birth rates, particularly for Hispanic females, has been a very major factor; arguably, the most important. Not all migration is based on job prospects, including the large number of immigrants to California from certain Central and South American and Asian nations that are political refugees. However, even if it is agreed that job growth is the most important factor, it is still vital to make a projection of job growth based on proper analysis – and we find that ABAG's controlling assumption that the Bay Area will maintain a permanent advantage over the rest of the U.S., and the world, in technology jobs to be highly questionable – and not concurred with in the projections made by other respected economists and demographers, as included in the Beacon report.*

Sincerely,

*Tom Rubin*

- C167-1** I find the Plan Bay Area to be a disturbing and ill defined project based on obvious false projections. The job projections for Sausalito relative to the rest of Marin is especially hard to believe. I request that the jobs and housing growth projections be reconciled with the Department of Finance projections.
- C167-2** Any projects should be under the authority of local jurisdictions and not be 'streamlined' through state law. Marin and the bay area is a collection of individual communities and uniformity should not be assumed or encouraged.
- C167-3** I recommend increased focus on alternative methods of reducing green house gases such as Marin Clean Energy, electric vehicles etc. The reduced environmental impact relative to high density building seems obvious however a more detailed analysis would be appreciated.
- C167-4** Many of the conclusions of the EIR suggest considerable environmental damage and I would advocate to discourage growth in Marin county and the bay area as a result.
- C167-5** The No Project alternative has been largely ignored however I would like to see this more thoroughly explored rather than automatically rejected. Susan Samols [REDACTED] Avenue Sausalito, CA 94965

**Subject:** Comments on DEIR for Plan Bay Area

C168-1

I respectfully request more time and an official extension of 6 months. There are numerous inadequacies, oversights, incorrect assumptions and lack of true public engagement in the plan. It doesn't even meet its goal of reducing greenhouse gases. While I applaud its goals of increasing affordable housing and transportation alternatives and reducing sprawl, I believe you have it backwards.

Reliable, good public transportation that easily gets people to their destination is needed first. Right now, and still in the plan, there is NO good way to get to the East Bay from Marin and vice versa. The one bus per hour that leaves Richmond BART occasionally leave ahead of schedule, stranding passengers who expect it to be there. The lack of integrated bus passes, getting better w/the Clipper card but still woefully inadequate, HAS to be addressed. The buses HAVE to go to more places where people want to go. I cannot get to Steinhart Aquarium or Golden Gate Park in any convenient fashion from Marin. This integration needs to be developed first, before loading up housing near the SMART train station which will serve only a very small proportion of just commuters.

The lack of transparency and inability for public comment and legitimate questions to actually be incorporated in this plan makes it a farce. This is a done deal, and that is what people are reacting to. There has been no real outreach, with the goal of addresses concerns. This plan is a first draft. Treat it as such, bring it back with good changes, and the scenery could shift.

Marin is also rural/suburban, and any housing numbers should be based on that designation.

Sincerely,

Judy Schriebman

MTC, Plan Bay Area Public Comment  
101 Eighth Street  
Oakland Ca 94607

C169-1 I would like you to VOTE for the "No Project" Alternative because of the many flaws in the DEIR.

C169-2 The DEIR is in error in its projection about future Green House Gases (GHS) and job growth. The DEIR is using data from 2005!

The DEIR must be brought up to date and a revised DEIR needs to be completed.

As a voter in Novato, I request this aspect of the DEIR be revised and those results be publicly vetted before any voting can take place.

Sincerely,

Jim Shroyer

Re: Opposition to Draft Bay Area Plan and DEIR affecting Orinda

Ladies and Gentlemen:

The purpose of this letter is to plead wholeheartedly with you, as we are doing with the Orinda City Council, to carefully consider our opposition to the Draft Bay Area Plan and Draft Environmental Impact Report promulgated by the Association of Bay Area Governments (ABAG) and the Metropolitan Transportation Commission (MTC), as well as to the procedures surrounding public comments and voting on the drafts. We will both be out of town on May 13, 2013, and are thus submitting our comments in writing.

We moved to Orinda from Southern California in 1997 and have lived in Sleepy Hollow for 16 years. One of us is a former Realtor and retired attorney who practiced with a large, respected law firm, representing clients including The Irvine Company and other real estate developers and litigating matters of property tax law, foreclosures, and partnership law. The other began his career as a builder and real estate developer, then became involved in city planning and redevelopment for a Rouse Company subsidiary, large-scale residential development and finance in Southern California, ran several small operating businesses, and currently is a principal in a successful San Francisco-based private equity firm. We raised two children in Orinda, investing a great deal of effort not only in fundraising for the Orinda schools but also in advocating for students with special educational needs. We have been active with Orinda Newcomers, an Orinda swim team, an Orinda church, OYA and traveling soccer and lacrosse, and Miramonte sports. We have always paid far above average property taxes here, and now the state has imposed new taxes on "the rich," which of course hits Orinda disproportionately because of its above average income levels -- at the same time as there are proposals pending to reduce the state's per pupil funding for Orinda schools. And then this Plan comes along, with huge costs and likely tax breaks and/or subsidies for some. Ironically,

our now adult children (who are teachers) can't afford to live in either San Francisco or in Orinda, but would not be the least interested in living in low- or moderate-income housing in a suburban Orinda downtown as they are nature lovers and they'd feel out of place in a largely affluent community. So, despite the inferior school system our grandson is in, they live in Oakland and Berkeley where they have lots of socioeconomic peers, gardens, chickens, and a yard.

C170-1

In 2012, we both attended an open Orinda City Council meeting because we heard that the council was considering adopting a new master plan that would have allowed 5-story buildings in the village and downtown. The public was allowed a few minutes per person to address a vaguely outlined zoning proposal, and we did not hear anything about ABAG or MTC or about Orinda's plan being part of a regional plan with a low-cost housing component or transit village or carbon reduction. In fact, we were baffled at why this was being presented and who the parties of interest were, especially since we didn't hear of any pending submittals for development approval or any customary drawings one would expect as part of a master plan amendment. The city advanced an argument involving retail sales tax, but it was apparently all a ruse. Someone suggested that the town commission an EIR and/or retail feasibility study, and the city refused on a budgetary excuse. The tone of the meeting was that the Council was annoyed at the public expressing their concerns. Only this year did we hear from Orinda Watch about ABAG, MTC, and the proposed plan. We then realized that's what had been behind the earlier discussion at the City Council meeting, and we felt we'd been intentionally misled, the Council having purposely omitted crucial background information as to why 5-story buildings in downtown Orinda were even being discussed.

We aren't allowed to so much as cut down one of the many oaks in our yard without getting Orinda's approval; so how can Orinda revise its master plan, change its downtown with potentially significant effects on our roads, traffic, environment, and schools, and yield to regional agencies' asserted authority or control without getting informed input and approval from a majority or at least a broad consensus of Orinda's and other affected cities' voters?

C170-2

Today, the threshold substantive question is: Is the overall ABAG/MTC proposal the most efficient, most predictable, and least intrusive way of achieving the primary goal, which we understand to be reducing greenhouse gases to meet the state's target? However, apparently you are more concerned with form and procedures than with substance, and these, too, are amiss.

It would seem highly unlikely to us, as professionals, that a plan as complex as proposed--involving extensive changes in property rights and expenditures approaching many billions of dollars over several decades--would produce the intended result without creating a staggering assortment of unintended consequences and unforeseen costs. At best, this is a risky venture capital deal at public expense!

Moreover, it would seem that the greenhouse gas reduction goals can be achieved simply by addressing auto emissions, mileage ratings, animal husbandry practices, and increased use of electric buses or other such innovations, without entering into massively complex and disruptive rezoning, subsidizing, and behavioral modification programs that compromise private property rights, require the use of eminent domain and/or massive public subsidy. Indeed, we just reduced our family's greenhouse gas emissions by roughly 80% by trading in a big SUV for a smaller, more efficient vehicle. This involved no subsidy, and we are saving money on gas as well as improving the environment!

When we were professionally involved in the various aspects of real estate, especially development and finance, we would never have presented or financed a project based on assumptions that human behavior would change in certain desired ways, nor would we have presented misleading descriptions distorting the differences between alternative development options by using a scale that didn't begin at zero in order to portray a tiny difference as if it were a huge difference (see Orinda Watch letter to Mayor Amy Worth and the Orinda City Council, dated May 10, 2013, at pp. 15-16). Nor would we have compared alternatives where in one case we assumed whatever zoning changes advanced our agenda against the existing (or "No Project") scenario where we assumed no zoning changes for the next 30 years. How can these manipulations be tolerated? Has there ever been a historical period in which the Bay Area's 101 cities and towns made no zoning changes and/or granted no zoning variances over a 30-year period? Have these cities and towns ever accurately predicted their housing demands, not only in numbers but in desired locations and price ranges, over a period of a decade, let alone three decades? If not, then ABAG/MTC's assumptions are unsupportable. Have statistical regression analyses been run to see how various economic and social factors correlate with housing demand, city by city, income level by income level? That is how we are accustomed to strategic planning in the corporate and financial worlds. And in law, we are accustomed to supporting our arguments with proven facts, not assumptions. Have the ABAG/MTC Plan and DEIR met with any such level of objective scrutiny and due diligence?

C170-3 Moreover, in the business world we are prepared to take the risk of being wrong and having to pay for the consequences of our mistakes and seek other solutions. What will you do if this plan is adopted and then doesn't work? What will you do if greenhouse gas issues are resolved another way, making this plan unnecessary or obsolete? Will the ABAG/MTC plan then be unwound? What if we, the City and its taxpayers, can't afford it? What if demographics change?

C170-4 If reducing greenhouse gases is the desired end, then what does it even matter what the income levels are of the residents in the closer-to-transit housing units? Indeed, the higher the income, the more likely the cars they drive would be newer and therefore more fuel efficient, or they might be retired and not working, thus expending fewer emissions on commuting to a job.

C170-5 We are not able to address the Draft Plan and Draft EIR point by point, due to time constraints and complexity. We assert, rather, that the Draft Plan and DEIR have not been properly communicated to the public, so the public has not yet had the opportunity to let the City Council members know how to best represent their constituency. Therefore, Orinda should strongly advocate for an extension of the deadline for commentary (both to Orinda itself and to ABAG/MTC) while the City Council solicits broader public "informed consent" and at the same time inquires objectively into whether the Plan and the EIR have valid factual and analytic support. By "informed consent" we mean that the city council should take action to disseminate the facts, not as a policy or foregone conclusion, but as a proposal that likely to affect the city, for better or worse, in ways one may or may not anticipate. For example, we have heard that low-income housing in Dublin resulted in adding 3.7 children per unit to the local public schools, though the city had only anticipated about 2 children per unit. What assumptions have been made that might be equally unpredictable or wrong concerning Orinda? Does the plan take into account the greenhouse gas effect of a downtown with restricted automobiles and more people moving to downtown Orinda who will have to find jobs outside Orinda? Orinda is not now a hub of employment, and with some of its businesses being closed to make way for redevelopment of the downtown, and some of the convenience services like dry cleaners perhaps not located in the future where one could just drive up, run in and out, many may not come back -- and Orindans may have to drive -- more miles -- to Lafayette for these services now purchased in Orinda. New downtown residents may have to drive or take BART to a job outside Orinda (perhaps a job closer to where they now live). If they drive, that is added vehicle miles. BART is already overcrowded. It's impossible to get a seat during commuting hours between Orinda and San Francisco's

Embarcadero station, so more people who now ride BART may decide to drive, adding vehicle miles. Yes, we know that some of the ABAG allocations will be met with senior housing, and that's good, but let's let Orinda decide what Orinda wants and needs, not unelected regional agencies.

We assert that the leadership of Orinda's Mayor on the MTC board is in itself an unacceptable conflict of interest that taints the Orinda City Council's whole approach to this matter. It appears unlikely that Ms. Worth can serve two masters well -- an unelected agency as well as Orinda citizens who elected her to preserve and protect the character of Orinda, its city plan, the property rights, property values, and lifestyle of its residents.

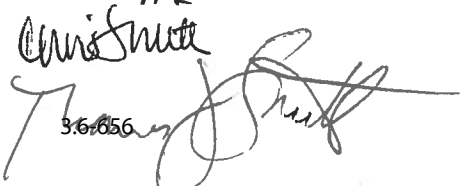

Coupled with previous public discussions that have not been forthright in letting Orindans know what its council was considering (as we described our own experience, above), council members seem to have been purposely misleading -- or at least obfuscating or dissembling -- and this requires rectification through a longer comment period and more honest communications going forward.

C170-6

Are the Plan and the DEIR supported by valid facts, assumptions, projections, charts, and analysis? They have not been before the public with sufficient time for the public (who have families and jobs) to be able to read the full draft plan, the complete draft EIR, the supporting documents and analysis, as well as time to digest what they mean, do additional research or analysis as the individual citizens may deem necessary in order to then prepare a reasonable written commentary to submit on time to ABAG, the MTC, as well as to the Orinda City Council. We submit that the 1,460 pages of the Plan and EIR and huge number of supported or referenced documents can't possibly be responded to fully by tomorrow or by May 16, 2013, especially when most Orindans don't even know there is a pending plan. We are certain that, with time, there could and should be more input on the impact of the draft Plan and DEIR on Orinda's schools and traffic circulation, and perhaps its property values, lifestyle, and its current business owners and customers who frequent those businesses, as well as clarifying MTC goals.

We urge you to grant an extension of time for the comment period for this monumental undertaking. We urge Amy Worth to select which she represents, MTC or the citizens of Orinda. And we urge you to vote no on the draft Plan and DEIR as we do not believe they are the least intrusive or best solution to the greenhouse gas emissions goals of the State.

Sincerely, -

Re: Comments on Model One and UrbanSim utilized in the preparation of PLAN BAY AREA  
DRAFT ENVIRONMENTAL IMPACT REPORT—April 2013

Dear Sir/Madam:

This letter provides my comments on the models used in the Draft EIR referenced above.

My comments are summarized starting on page 2 and detailed justification is appended. My qualifications, in brief, are provided below.

Dr. Panos Prevedouros, author of this submission, is professor of transportation engineering at the University of Hawaii at Manoa. Dr. Prevedouros earned his PhD in 1990 and his M.S. in 1987, both in Civil Engineering from Northwestern University, Evanston, IL (1987), and his Diploma in Engineering from Aristotle University, Greece (1986.) He is a registered Professional Engineer in the European Union.

Dr. Prevedouros is subcommittee chair of TRB in the area of traffic simulation (freeway operations) since 2006. Dr. Prevedouros was member of Oahu MPO Technical Advisory Committee in the late-1990s and is the principal investigator of several transportation research projects funded by Hawaii DOT, US DOT, OMPO and DOI.

Dr. Prevedouros has expertise in urban planning, traffic flow analysis and optimization, ITS, demand forecasting and evaluation of transportation alternatives, and sustainable infrastructure with emphasis on energy and impacts.

Dr. Prevedouros has published over 100 technical articles and reports, and co-authored the 2nd and 3rd editions of internationally adopted textbook Transportation Engineering and Planning (Prentice Hall, 1993 and 2001.)

Dr. Prevedouros has received several awards including Best Paper award on transportation noise, TRB, 1995 • Outstanding Faculty award, ASCE-Hawaii, 1996 • Van Wagoner award, ITE, 2005 • Freeway Operations Service award, TRB in 2009. • Honolulu Star Bulletin's one of the "10 People Who Made a Difference in Hawaii in 2008" • 2011 Sustainability Paper award, World Road Association • 2012 Honor Certificate for Public Service, Council of the City and County of Honolulu.

## Summary of comments

The state of the art in modeling in urban planning is lagging the state of the art in traffic engineering. The lesson learned from traffic simulation is that high-fidelity traffic simulation models are wonderful at the local level but ungainly and impractical for regional scenario analysis. Worse yet, their errors become intractable and the uncertainty (confidence intervals) of mean estimates are too large. As a result, since the turn of the millennium there has been a stronger emphasis on mesoscopic models that preserve critical micro-level mechanisms and simplify the processing of transportation flows on large and complex networks.

MPOs need to learn from this experience from traffic engineering and apply microsimulation for useful case studies such as SF-CHAMP [42]. For their long large regional plans, they need to develop more robust mesoscopic models. Very few, if any of the UrbanSim/Model One outputs for 2040 are reliable or significantly different from each other among alternatives. If properly applied, statistical tests would not allow for the identification of the locally preferred plan at a reasonable level of confidence. For example, the minutes from the Bay Area Regional Modeling Working Group meeting on October 3, 2012 reveal that “There was considerable interest in model calibration and validation issues. Chris asked about the model’s margin of error, which David [Ory] indicated was large at this point.”

Given that MTC and ABAG chose to base multibillion dollar public expenditures on the long range application of the microsimulation model UrbanSim, my UrbanSim-specific comments are as follows.

All my comments are based on literature published in 2010 or later that directly cites the software UrbanSim as a reference or basis of comparison of the work presented. Only recent works were reviewed to minimize old criticisms that have potentially been rectified in recent versions of the model.

UrbanSim is complex multi-component land use and transportation software that needs to be operated by a team of analysts over a period of years in order to provide estimates for a large metropolitan area. The workings of UrbanSim, as described by experts including its developers, are summarized in [Appendix A](#). It is clear to me that each application of UrbanSim in a specific urban area requires customization and enormous data sets. UrbanSim has six main models (not counting Model One that provides transportation input.) In the words of a user: “For example, the Household Location Choice Model of the application described here has more than 50 setting options, with a similar number for other models.” [22]

In their 2007 Assessment of Integrated Land Use/Transportation Models for the Southern California Association of Governments, Fehr & Peers observe that “UrbanSim integrates with a

travel demand model at the input and output level. Current users of UrbanSim include the MPOs for Salt Lake City, Houston, Seattle, Detroit, and Honolulu<sup>1</sup>.” [61]

Many published uses of UrbanSim are exploratory research, case studies or incomplete applications given that the model has been available in a comprehensive form for less than 10 years. Several sample applications of UrbanSim since 2010 are summarized in [Appendix B](#). The limitations of UrbanSim applications and testing are clear; Many of the published works simply try to establish a base case or address one aspect of land use. Zurich is a telling case: “Within the project, the land use model UrbanSim were adapted and implemented for the Greater Zürich area. However, validation work revealed that there is more need for calibration.” [17] The subject of calibration and validation is critical; it is discussed later on. “At present a first running environment that forms a very basic ‘super simplified’ simulation environment [of Zurich] has been realised. This includes very reduced household location choice and employment location choice models.”[68]

An evaluation at the Department of Geography, University of Potsdam, Germany [34] assessed model suitability to geosimulate housing market conditions. “...45 points is the highest possible score, meaning that a simulation system is perfectly suitable for the suggested simulation framework. UrbanSim received the highest score (33).” In other words, in just one examined dimension out of six dimensions involved in urban area modeling, UrbanSim scored comparatively well, but its ability to cover this dimension is only about 73%. This is part of the positive assessments of UrbanSim summarized in [Appendix C](#).

[Appendix D](#) lists a number of weaknesses of UrbanSim identified in recent publications. In recent years several jurisdictions and researchers evaluated UrbanSim and chose not to use it for their planning needs (e.g., [7, 16, 63]) mostly on the grounds of complexity and data requirements. However, once UrbanSim is chosen, there are several specific concerns such as:

- “The insignificance of the public transport accessibility coefficient creates a major limitation of the model.” [17]
- “Even drastic accessibility changes have little impact on construction activity or population growth.”[19]
- “Inertia in income distribution and prices seems to be strong, with little variation in an eight year simulation period.” [22]
- “Current practice in UrbanSim modeling treats developer behavior and the emergence of land prices as independent processes. This assumes that land prices are exogenous to the interaction between buyers and sellers—an assumption hard to sustain in urban economics and real estate research.” [59]
- Large models are “vulnerable to the trends contained in the historical data they use, especially recent trends.” [63]

---

<sup>1</sup> Oahu MPO informed me that the Honolulu Department of Planning and Permitting is working towards some deployment of UrbanSim and when DPP is finished with its geographic representation, OMPO plans to adopt it into their TransCAD based modeling framework. OMPO does not use UrbanSim currently for its routine tasks.

- “As there are multiple secondary reasons that might obfuscate the model estimation process, it is recommended that UrbanSim model estimation results are compared against standard econometric software to make sure that the data and underlying assumptions made by UrbanSim are indeed understood correctly.” [26]

It should be made clear that the concerns above are mostly out of case study or research applications. These substantial weaknesses are not based on model outputs that are subsequently used to approve hundreds of billions of dollars in public expenditures.

Calibration of UrbanSim is a difficult process. Some have deployed “response surfaces and metamodels to mathematically approximate intractable, simulation-based processes.” [03] The uncertainty involved in these processes notwithstanding, there is no good reason why the parameters calibrated to match 2005 or 2010 conditions are applicable in 2035 or 2040.

Dr. Paul Waddell, chief modeler of UrbanSim stated that “Computational performance and inability to validate integrated microsimulation models due to stochastic variation and instability, were raised as very legitimate concerns. We need to take uncertainty in models seriously.” [37] Yet the application of UrbanSim in this EIR clearly did not involve a validation and uncertainly analysis effort commensurate to the public policy implications of the model's results.

Critical assumptions in the model's logic are violated, such as this major conclusion from a Purdue University study for the Indiana DOT: “Based on a review of the research literature, **transportation infrastructure appears to be a necessary, but not sufficient, condition for generating economic development.**” [63] Plan Bay Area heavily relies on the false hypothesis that the development of PDAs and TODs bestowed with good transit access generates economic development.

Furthermore, “MTC and ABAG also have a large body of detailed published documentation regarding the integrated travel demand and land use model. This data and other documents can be obtained from the Plan Bay Area website at [www.onebayarea.org](http://www.onebayarea.org).” [EIR, Page 1.2-18]

However, searching for UrbanSim finds the chapters and appendices of the EIR but no detailed documents that address the integration of UrbanSim and Model One. MTC's David Ory responded to an inquiry by Peter Singleton as follows: **The integration is straightforward: UrbanSim passes TAZ data<sup>2</sup> to the travel model and the travel model passes accessibility data to UrbanSim (see \accessibility in the scenario folders). This is discussed on page 9 of the Predicted Land Use Appendix<sup>3</sup>.** In fact Mr. Ory is pointing to one half page of “explanations” titled Travel Model Interaction on “page 9”:

<sup>2</sup> <http://analytics.mtc.ca.gov/foswiki/Main/TazData>

<sup>3</sup> [http://onebayarea.org/pdf/Draft\\_Plan\\_Bay\\_Area/Draft\\_PBA\\_Summary\\_of\\_Predicted\\_Land\\_Use\\_Responses.pdf](http://onebayarea.org/pdf/Draft_Plan_Bay_Area/Draft_PBA_Summary_of_Predicted_Land_Use_Responses.pdf)

“Bay Area UrbanSim and the Travel Model work as a system to capture the interaction between transportation and land use. **Accessibility to a variety of urban features is a key driver in both household and business location choice.** For instance, households often prefer locations near employment, retail, and similar households but avoid other features such as industrial land use. Business preferences vary by sector with some firms looking for locations popular with similar firms (e.g. Silicon Valley) while others desire locations near an airport or university. In all cases, the accessibility between a given location in the region (defined as a Transportation Analysis Zone or TAZ) and all other locations/TAZs is provided to UrbanSim by the Travel Model. These files represent overall regional accessibility for future years considering changing infrastructure. Updated skims were provided to UrbanSim in the projection years 2018 and 2025 based on projects expected to be in place in 2020 and 2035, respectively.

Moving in the other direction, UrbanSim provides the Travel Model with a projected land use pattern and spatial distribution of activities for each year into the future. This pattern includes the location of housing, jobs, and other activities that serve as the start and end locations for trips predicted by the Travel Model. This information was provided to the Travel Model at a TAZ level aggregation for each future year examined. Overall, the linkages between the two models allow land use patterns to evolve in relation to changes in the transportation system and for future travel patterns to reflect dynamic shifts in land use.”

The skimpy information above reveals that a major assumption in the model does not hold water: “A general critique of integrated land use and transport simulations is that often the notion of integration is reduced to the principle that the calculated accessibility or travel time measures serve as one of the explanatory variables of the residential choice module.

Timmermans states that **“the literature on residential location choice behavior has systematically shown that accessibility plays a marginal role in the residential choice decision.** According to him, structural attributes of the house and physical and social characteristics of the neighborhood are more important.” [17]

Another likely weakness on Model One affects UrbanSim and is not addressed in the EIR: “Travel models, including activity-based travel models developed in recent years, still generally use traffic analysis zones and ignore local streets in their network representation. In short, they ignore walking scale access and movements. This is a well-known and very problematic limitation in current travel models, and by extension, in integrated land use and transportation models, even if the land use models are at a parcel level.” [04]

UrbanSim's intended use, assumptions and limitations in its application for this EIR are described by the model's developer and consultant to MTC and ABAG in Appendix E. A basic critique of these assumptions is as follows. Numbering corresponds to the list in the EIR which is also copied in Appendix E:

- C171-3** 1. **"Interactions with adjacent areas are ignored."** It is unclear how this limitation affects Alternative 4 which has interactions with the counties surrounding the 9-county area of the Plan.
- C171-4** 2. **"A project that is inconsistent with current land use regulations cannot get a waiver."** This assumption is both impractical and unsupportable over 30 years.
- C171-5** 3. **"...needs to be determined by a combination of sensitivity testing, experience from use, and common sense."** However, none of these are applicable to a 30 year horizon given that the model is barely 10 years old. There are barely any sensitivity and uncertainty studies available, let alone proof that sensitivity and uncertainty ranges are small.
- C171-6** 4. **"...there was not sufficient time or resources to thoroughly address all data problems encountered, including some extreme values, missing values, and inconsistencies within and among data sources."** Indeed this appears to be a rushed application on a very large area. The amount of built-in errors is likely substantial.
- C171-7** 5. **"One of the most common assumptions in models, and one rarely acknowledged, is that behavioral patterns will not change dramatically over time."** A look in the 30 years between 1980 and 2010 suggests that this assumption will certainly be violated. For instance HOT lanes, cordon pricing, and telecommuting (now accounting for more trips than all forms of rail in the US) were basically unknown in 1980. (Starting at 2010 and looking back 30 years takes us to 1980; looking forward takes us to 2040.) Assuming technological and behavioral stagnation between 2010 and 2040 is necessary and convenient for the modelers, but it is not defensible.

My conclusion below is in accord with experts in the field, as highlighted by the excerpts in Appendix F. It should be clear that the activity and land use modeling frameworks are far from being mature and are not reliable for long range forecasts. The result of all this modeling sophistication applied over huge dimensions such as a time horizon of 30 years, a geographic area of nine counties and covering the activities of seven to nine million people is sky-high uncertainty that is never revealed but renders all 2040 results practically useless.

Sincerely,

**Panos D. Prevedouros, PhD**

Re: Comments on Transportation Related Analysis and Results of PLAN BAY AREA  
DRAFT ENVIRONMENTAL IMPACT REPORT—April 2013

Dear Sir/Madam:

This letter provides my comments on the transportation options and results presented in the Draft EIR referenced above. My comments are summarized starting on page 2. My qualifications, in brief, are provided below.

Dr. Panos Prevedouros, author of this submission, is professor of transportation engineering at the University of Hawaii at Manoa. Dr. Prevedouros earned his PhD in 1990 and his M.S. in 1987, both in Civil Engineering from Northwestern University, Evanston, IL (1987), and his Diploma in Engineering from Aristotle University, Greece (1986.) He is a registered Professional Engineer in the European Union.

Dr. Prevedouros is subcommittee chair of TRB in the area of traffic simulation (freeway operations) since 2006. Dr. Prevedouros was member of Oahu MPO Technical Advisory Committee in the late-1990s and is the principal investigator of several transportation research projects funded by Hawaii DOT, US DOT, OMPO and DOI.

Dr. Prevedouros has expertise in urban planning, traffic flow analysis and optimization, ITS, demand forecasting and evaluation of transportation alternatives, and sustainable infrastructure with emphasis on energy and impacts.

Dr. Prevedouros has published over 100 technical articles and reports, and co-authored the 2nd and 3rd editions of internationally adopted textbook Transportation Engineering and Planning (Prentice Hall, 1993 and 2001.)

Dr. Prevedouros has received several awards including Best Paper award on transportation noise, TRB, 1995 • Outstanding Faculty award, ASCE-Hawaii, 1996 • Van Wagoner award, ITE, 2005 • Freeway Operations Service award, TRB in 2009. • Honolulu Star Bulletin's one of the "10 People Who Made a Difference in Hawaii in 2008" • 2011 Sustainability Paper award, World Road Association • 2012 Honor Certificate for Public Service, Council of the City and County of Honolulu.

The Executive Summary of the Draft EIR states that “... the land use strategy is to enhance mobility and economic growth by linking housing/jobs with **transit**, thus offering a more efficient land use pattern around **transit** and a great return on existing and planned **transit** investments.”

C172-1

Based on this the reader should understand that this planning effort sought to establish a transit-based “environmentally superior” alternative instead of seeking the most cost-effective alternative or the alternative providing the fastest, most-economically productive set of systems that meet environmental limits. As a result, **Plan Bay Area** is the **10% Plan**.

The plan’s disproportional reliance on transit has predictable consequences; it is expected to yield many significant and unavoidable impacts such as substantial increase on roadway facilities already operating at the worst level of service (LOS=F)<sup>1</sup> as in conclusion 2.1-3; loss of forest land to non-forest use, conversion of substantial amounts of important agricultural lands and open space to non-agricultural use as in conclusions 2.3-4 and 2.3-5; increase in the number of people residing within areas regularly inundated by sea level rise by mid-century, as in conclusion 2.5-6; noise levels from transit sources that exceed FTA exposure thresholds as in conclusion 2.6-3, etc.

In the following pages I highlight passages and exhibits in the Draft EIR that are cause for major concern. All text in “quotes” is excerpted from the EIR. **Bolded** words in the quotes are mine.

C172-2

Table 1.2-1: The population and employment projections are likely overstated. Such demand balloons are common in pro-transit and pro-rail plans as various analyses by Oxford University professor Bent Flyvbjerg have discovered in the last two decades of his investigation of mega-project planning studies.<sup>2</sup> In addition Dr. Flyvbjerg’s recent work has discovered the inertia of the US planning profession to acknowledge these biases and exaggerations. His data-supported criticisms are summarized in Appendix A.

In addition, the current enabling environment is much different than the past 30 years due to persistent low growth, large unemployment and huge city, state and national debts that will undoubtedly manifest themselves in increasingly heavier taxation. Indeed, Yogi Berra’s “the future isn’t what it used to be” must be the guiding principle for planners, executives and

<sup>1</sup> The quality of traffic flow on freeway, highways and other roadways is determined used the 2010 edition of the Highway Capacity Manual published by the Transportation Research Board (TRB). Based on scientific estimates of delay, density and other properties, the quality of traffic flow is ranked from A to F which, similar to school grades, depict excellent flow conditions at LOS=A and unacceptably poor flow conditions at LOS=F. For most US counties, the lowest acceptable LOS for permitting new development and similar purposes is D or E.

<sup>2</sup> Bent Flyvbjerg, Nils Bruzelius and Werner Rothengatter, Megaprojects and Risk: An Anatomy of Ambition, Cambridge University Press, 2003. [“Megaprojects” are infrastructure projects costing over one billion dollars.]

decision makers. However, this study does not even provide lip service to these important population and employment retardants.

C172-3

Page 1.2-9: “The analysis for the most recent regional transportation plan, Transportation 2035, suggested that the region’s transit system is not sustainable based on current projections of transit costs and reasonably anticipated revenues. **Transportation 2035 identified a region-wide transit capital deficit of \$17 billion and operating budget deficits of \$8 billion over the next 25 years.**”

These are staggering deficits for a transportation mode used by 10% of commuters and less than that by non-commuters. Planners acknowledge that these deficits are not sustainable for the community. Yet Plan Bay Area calls for more deficit-making transit. Of all transportation expenditures in the plan, 62% is allocated to fund the mode that provides 10% or less of the transportation in the area.

C172-4

Page 1.2-17: “The MTC travel demand model, Travel Model One, is a regional activity-based travel model for the San Francisco Bay Area. This model is actually a set of individual models that perform different functions, leading to projections of future Bay Area travel. The models were developed from a database that consists of the MTC 2000 Bay Area Household Travel Survey (BATS 2000) and traffic and transit counts that are used to validate the model results. The model was re-validated using available American Community Survey 2005 data to reflect updated demographics; **since 2010 Census data was not yet available at the beginning of this planning and modeling cycle**, the model was used to forecast transportation trends to the baseline year of 2010.”

There have been several concerns with ACS and its limited sampling nature to such extent that Hawaii paid for this data but does not use it. Not using Census 2010 data is a major missed opportunity. Nowhere in this report is clearly stated whether actual, finalized U.S. Census 2010 population, employment and related data by tract or block were used in the projections and the models. It is my understanding that the analysts of the EIR developed projections to 2010. Then these projections were used as the basis to develop projections to 2040. One of the results of this projection-upon-projection methodology is that error propagation renders long term projections practically useless. It comes as no surprise that the EIR does not provide variances and confidence intervals for the forecast outputs.

C172-5

Page 2.1-1: “Together, these roadway facilities accommodate nearly **17 million vehicle trips** a day.” At a typical occupancy of about 1.2, this translates into 20.4 people trips. Page 2.1-5: “Transit in the Bay Area accommodates almost **1.6 million boardings** a day, primarily through

four major operators (Muni, BART, AC Transit, and VTA).” Putting these two together allow for some informative comparisons, as follows.

- 1.6 million boardings are about 1.23 million person trips assuming that one transit trip needs 1.3 transit boardings.<sup>3</sup>
- The **road-to-transit** ratio of person trips is 20.4 to 1.23 or approximately **17:1**. In other words for every **18** trips made in the 9-county Bay Area only 1 is by transit. Based on the plan’s allocation, “1” or “transit” gets 62% of the funds, and “17” or “the roads” gets 38% of the funds and shoulders the burden of accommodating road-going transit such as bus, express bus, BRT and streetcars!
- This ratio, 17:1, is flattering to transit because the length of transit trips is shorter than the length of road trips. On a passenger-mile basis this ratio is over 20:1.
- The roads also carry all the freight, services and emergency response. Therefore this proposed allocation causes roadway overburdening which delays people, goods, services and emergency response.
- In general the report is ignorant of freight flows, emergency response and other non-commuter uses of roadways.

C172-6

Page 2.1-10, Table 2.1-3: The table calculates delays thanks to well established highway flow models that keep highway performance accountable. Nothing similar is attempted for transit. A trip that is 40 minutes long by transit is delay-free. A similar trip by car is 20 minutes long (including all congestion delays) and it is recorded as delayed by 4.6 minutes. (Approximate travel times quoted from Table 2.1-14.) Apparently transit travels on ether and its users experience no delays. The table is oblivious to the fact that people not vehicles suffer the delays.

C172-7

Page 2.1-15, Table 2.1-6: The manifested travel behavior is that between 1970 and 2010 the transit share has been stuck at 10% despite the dozens of billions of dollars invested in Bay Area transit. This suggests that many more billions will be needed just to maintain the 10% share in commuting trips, and that there is no basis for expecting any growth.

C172-8

Page 2.1-21: “Senate Bill 375 (SB 375) requires MPOs to prepare a Sustainable Communities Strategy (SCS) that demonstrates how the region will meet its greenhouse gas (GHG) reduction targets through integrated land use, housing and transportation planning.” Unlike Plan Bay

<sup>3</sup> Unlinked Passenger Trips is the number of times passengers board public transportation vehicles. Passengers are counted each time they board vehicles no matter how many vehicles they use to travel from their origin to their destination and regardless of whether they pay a fare, use a pass or transfer, ride for free, or pay in some other way. Also called boardings. [<http://www.apta.com/resources/statistics/Pages/glossary.aspx>]

Area, SB 375 does not have a pro-transit bias. The specific pollution reductions can be achieved with technological improvements<sup>4</sup> rather than mode shifts<sup>5</sup>.

**C172-9** Page 2.1-21: “Each of the nine Bay Area counties has a Congestion Management Agency (CMA) designated to manage traffic congestion through implementation of multimodal transportation projects.” While this sounds reasonable, the intent of Plan Bay Area is to offer longer, less convenient trips by investing heavily in transit. How does heavy investment in transit mitigate congestion given a track record of failure to deliver?

**C172-10** Page 2.1-22: “This EIR does not explicitly identify localized traffic issues that might be the focus of a city’s general plan; rather, it will deal with issues of overall system performance from a regional perspective.” Given the size of the 9-county area one may safely assume that there were several dozen intersections operating at or near LOS=F in 2010. The plan adds significantly to the number of LOS=F intersections, but this impact is largely absent in the EIR. The type of modeling involved may not control for overly congested intersections. For example, by 2020 a critical intersection in the area becomes overly congested, i.e., its average delay is about two minutes per vehicle. However, the models may continue to route traffic and transit through this intersection to 2040, although real world motorists will likely be avoiding the route.

**C172-11** Page 2.1-23: The plan includes a criterion that makes transit look busy and in need for more funding: For roads it uses a criterion that demand is well over 100% of the capacity, but the transit criterion is that demand is barely over 80% of capacity. This is contrary to the typical operation of large metro systems which are designed for and allowed to operate at the so called “crash load.” This allows for the loading of trains with very little personal space for each rider and is necessary because of the disproportionately high loads of passengers in the peak hours compared to the rest of the day. Defining transit capacity at 80% is quite odd. By doing so, this criterion provides estimates of “very busy transit conditions” when the actual conditions are roughly half of the crash load conditions.

**C172-12** Page 2.1-25 and Table 2.1-11: “This investment strategy reflects the relatively mature state of the Bay Area’s roadway and transit systems. The proposed Plan also includes a set of major transit capital improvements, including BART to San José, Caltrain electrification, and bus rapid transit lines in the region’s urban core. These transit investments were identified as a result of a rigorous performance assessment process and align closely with the proposed land use pattern

<sup>4</sup> Many technological changes were observed since the turn of the century such as the demise of guzzling SUVs, common rail and direct fuel injection for gasoline engines, hybrids and plug-in hybrids, EVs, diesel hypermilers, etc. The very recent headline that *Consumer Reports* believes that the EV Tesla S may be the best vehicle they ever tested may have significant impacts in the future popularity of vehicles of this type.

<sup>5</sup> MTC’s regional statistics indicate that unlinked passenger trips changed from 504,442,000 in 2000 to 484,202,000 in 2010, a decline of 4%.

emphasizing focused growth in the region's locally-identified Priority Development Areas. Finally, the proposed Plan includes a limited amount of funding for targeted roadway capacity increases, including bottleneck relief at congested interchanges and the development of a Regional Express Lane Network."

Clearly this is a biased pro-transit plan to expend billions on the mode of transportation used by 10% of the commuters. On page 4, I provided estimations that in terms of trips the road-to-transit ratio is 17 to 1. The proposed investment strategy improves "17" by 3% and "1" by 27%. In other words, the Plan provides generous funding to Transit (that serves 1 out of 18 trips) and a disproportionately low funding allocation to Road (that serves 17 out of 18 trips.) As a result: "Overall, total vehicle hours of delay are forecasted to increase through year 2040 under the proposed Plan. Arterials and expressways will experience a larger increase in recurrent vehicle hours of delay relative to freeways (79 percent increase compared to a 48 percent increase). Non-recurrent delay on freeways will increase by 36 percent over existing conditions assuming implementation of the proposed Plan." (Page 2.1-27)

C172-13

The plan's data in Table 2.1-16 allow me to estimate that congestion on the area's roadways will worsen by 20%. I based this by looking at all trips in a day conducted under LOS=D,E,F which may be expressed as road conditions ranging from "very busy to very congested." Roads do most of the transportation work in the Bay Area but receive only 38% of the funding, so they will operate poorly, and worsen over time.

C172-14

Page 2.1-28, Table 2.1-12 is a quantified manifestation of the plan's both pro-transit bias and wishful expectations:

- For 2010 the vehicle trips are 16.9 million and the transit boardings are 1.6 million. When converted to person trips they have a ratio of 17:1.
- For 2040 the vehicle trips are 20.7 million and the transit boardings are 3.05 million. When converted to person trips they have a ratio of 11:1.
- Table 2.1-6 indicates that transit trips to work increased from 294,000 in 1990 to 333,000 in 2010, a 13.3% gain over 20 years or **less than 7% per decade**. This is a historical fact. This also agrees with the trend for transit usage in the LA metropolitan area. Based on 2011 to 2013 statistics, LA's projected growth of transit usage over a decade is 8.8%.<sup>6</sup>
- Table 2.1-12 indicates that transit boardings will increase by 93% in the 30 years from 2010 to 2040, or **31% per decade**. This is clearly a pro-transit exaggeration.
- This expectation for transit substitution is behaviorally and historically unsupportable.
- The fantasy of transit ridership continues in Table 2.1-18. Heavy rail utilization: 40% in 2010, 57% in 2040. Light rail utilization: 35% in 2010, also 57% in 2040.

<sup>6</sup> <http://www.metro.net/news/ridership-statistics/>

- Are these science-based estimations or faith-based guesses? Is there any evidence that any large metro area in the US had any appreciable increase in transit mode share? Is there any evidence that any large metro area in the US had a decadal increase in transit mode ridership of over 10% in the last 20 years, let alone 31%?

The result of the transit bias of the Plan is predictable, as follows.

Page 2.1-29: “Of the five significance criteria considered, **significant impacts are only forecast for one criterion: per capita vehicle miles traveled in extremely congested conditions**. The four other criteria—commute travel times, non-commute travel times, per capita vehicle miles traveled, and transit utilization—all have impacts that are forecasted to be less than significant.” Clearly the plan fails to add transportation capacity to the roadway system where it is needed the most.

Despite the plan’s best intentions for transit and providing it with a 62% share of the transportation funds, transit fails to deliver competitive travel times, as follows.

C172-15

Page 2.1-31, Table 2.1-14: **Drive alone** time per trip changes from 18.7 minutes in 2010 to 18.0 minutes in 2040. **Carpool** time per trip changes from 14.2 minutes in 2010 to 13.7 minutes in 2040. Both largely due to the HOT lanes. **Bike and walk** trips remain largely the same at 13 and 19 minutes, respectively. However, **transit** travel time remains stagnant at an uncompetitive 44 minutes. Despite being disproportionally over-funded, **transit delivers double the travel time** of any other mode, or worse during commute times when roadways are congested. Table 2.1-15 displays the non-commute travel times. According to those, **transit delivers triple the travel time of any mode other than walking**.

C172-16

Page 2.1-31: “Cleaner fuels and improved emission controls have substantially reduced emissions from mobile sources in recent decades. However, growth in motor vehicle use (as measured in VMT on both a per capita and an absolute basis) has offset some of the benefit of the improved emission controls.”

The authors have ignored the fact that national VMT has been flat since 2005 and gasoline consumption was down 8% in 2012 from the high of 2005 as shown clearly in this EIA trend.<sup>7</sup> EPA’s 2012 report Light-Duty Automotive Technology, Carbon Dioxide Emissions, and Fuel Economy Trends: 1975 Through 2012<sup>8</sup> states “Highlight #1: CO<sub>2</sub> emission rates and fuel economy values reflect a very favorable multi-year trend, beginning with MY 2005.” And “Using a 5-year timeframe (2006 and 2007 are good base years since there was little market volatility), CO<sub>2</sub> emission rates have decreased by 10% and fuel economy values have increased by 11% from MY 2006-2011. Based on preliminary estimates, CO<sub>2</sub> emission rates have decreased by

<sup>7</sup> <http://www.eia.gov/dnav/pet/hist/LeafHandler.ashx?n=PET&s=C100000001&f=M>

<sup>8</sup> <http://www.epa.gov/otaq/fetrends.htm>

13% and fuel economy values have increased by 16% from MY 2007-2012. The improvements have been even greater since the ‘inflection point’ year in 2004.”

There is little reason to believe that this trend is not applicable in California which is well known for its high fuel pricing, heavy taxation and debt, all of which weigh heavily on VMT growth. Therefore one may argue that strict future targets for emissions will be easily attained in 2040 with technological innovation and fleet renewal alone. All of section 2.5 on air quality reads like much ado about very little indeed.

**C172-17** Section 2.6 on noise leaves a lot to be desired. It has a somewhat detailed but flawed analysis of highway noise and no analysis whatsoever of Fixed Guideway transit. The EIR gives FG transit a pass card because most of it is “electrified.” This is contrary to local evidence as this quote from the Sept. 8, 2010 San Francisco Chronicle article suggests: “The Chronicle surveyed the BART system, sending a reporter on all 208 miles of rails - 104 in each direction - accompanied by a handheld sound-level meter. The survey found that noise levels can reach 100 decibels - the equivalent of a jackhammer - at points in the Transbay Tube. But the tube is not the only noisy part of the system, as many riders can attest. Trains produced noise levels of 90 decibels - as loud as a diesel truck - or higher at 23 locations.”<sup>9</sup>

**C172-18** Page 2.6-13 and 14: “Figure 2.6-6 is a graphical representation of the FTA noise impact criteria. Please note that Categories 1 and 3 apply the  $L_{eq}$  for the noisiest hour of transit-related activity during hours of noise sensitivity. Category 2 applies the  $L_{dn}$  since these receivers may be impacted by nighttime (10 p.m.-7 a.m.) transit related events.” The text and the actual figure are not in agreement regarding the metrics used for categories 1, 2 and 3.

**C172-19** Page 2.6-20: “Where such barriers exist, a **6 dB noise level reduction** can be assumed at receivers along those roadway segments.” If the TNM software was actually used to model roadway segments, why weren’t existing barriers with the correct height inserted to receive the correct noise level estimates? As the author of the State of Hawaii’s current FHWA-compliant Highway Noise Policy I can attest to the fact that a 10 ft. concrete noise barrier at an expressway cross-section that produces 77 dB(A) without the barrier will reduce the noise level to about 66 dB(A); a 12 ft. barrier will reduce the noise level to 64 dB(A). The 6 dB(A) noise reduction assumed in the EIR is low and produces results that overstate the noise impact of expressways with noise barriers.

**C172-20** Section 3.1 is the Alternatives Analysis. It is quite clear that (1) the Plan was favored with special treatment, (2) Alt. 4 is superior to the Plan, in my view, (3) alternatives 3, 4 and 5 are penalized with a \$8 toll on the Bay Bridge but the Plan is not, and (4) given the large uncertainty of model forecasts even for a 10 year horizon, let alone a 30 year horizon, largely no outcome

<sup>9</sup> <http://www.sfgate.com/bayarea/article/Noise-on-BART-How-bad-is-it-and-is-it-harmful-3175757.php>

of any of the examined alternatives is significantly superior or inferior to the Plan. **Also, none of the alternatives address mobility challenges and traffic congestion head-on.**

For example statements like “... Alternative 3 would have approximately **0.2 to 0.3 percent fewer vehicles in use**, VMT and engine starts compared to the proposed Plan” are scientifically absurd because in 2040 the variance of these estimates for each of these alternatives is at least one order of magnitude larger than the differences stated in the quoted text.

I assumed that business people who favor Alt. 4 know more about jobs and employment than planners, so I focused on Alt. 4 to develop some comparisons with the EIR’s preferred Alt.

**C172-21** I observed that Alt. 4 was marginally inferior only on outputs that come with large forecasting uncertainties such as congestion, emissions and noise. When it comes to more controllable factors such as future land allocations, many of which were made at the present time, Alt. 4 does better than the chosen alternative, as summarized in Appendix B.

**C172-22** Furthermore, the list of limitations of UrbanSim as applied to the Plan includes this: “Boundary effects are ignored. Interactions with adjacent metropolitan areas are ignored.” It is unclear how this limitation affects Alt. 4 which has interactions with the counties surrounding the 9-county area of the Plan.

**C172-23** The Plan provides a detailed breakdown of utilization of Transit (10% share) by Technology in 2040, Table 3.1-13; local bus, express bus, heavy rail, light rail, commuter rail, etc. However, the much needed table of highway transportation (over 70% share) for 2040 technology is absent. The missing table would include motorcycles, electric mopeds, light duty diesel vehicles, hybrids, EVs, plug-in hybrids, hypermilers (over 100 mpg vehicles), Euro 6<sup>10</sup> or lower truck emissions, etc. Projections of these technologies in the fleet are also critical for emissions and noise estimates. The 2040 plan is deficient in the important realm of highway vehicle technology and largely ignores the substantial changes that are likely by 2040.

**C172-24** On page 3.1-62 the EIR points the finger at the EMFAC emissions estimation model and says that it does not account for 2017-2025 manufacturer efficiency standards dictated by the EPA. The EIR needs to be updated and include technology forecasts for 2040 and emission estimates with EPA’s MOVES emissions estimation program. This modeling limitation generates an additional penalty for Alt. 4 because it has a higher population and employment thus higher cumulative VMT.

<sup>10</sup> [http://www.mantruckandbus.com/com/en/products\\_\\_\\_solutions/current\\_topics/euro\\_6/EURO\\_6.html](http://www.mantruckandbus.com/com/en/products___solutions/current_topics/euro_6/EURO_6.html)

C172-25

Overall, it is worth repeating that this EIR appears to be ignorant of momentous negative (-) and some positive (+) underlying trends such as:

- (-) persistent high unemployment
- (-) lower birth rate
- (-) increasingly expensive food and energy
- (-) higher state and federal taxes, and poised to grow more to cover debts and liabilities
- (-) higher health care cost, and poised to grow due to baby boomers and Obamacare
- (-) forced spending in infrastructure which is now too far from a state of good repair
- (+) low cost of capital
- (+) growing share of work-at-home and car-sharing schemes

Most of the trends listed above were absent in 1990 and 2000. So, this time around, truly “the future isn’t what it used to be” (Yogi Berra.)

The transit ridership predictions of the Plan are in conflict with recent system performance as indicated in the figure below; the figure was extracted from the most recent report of the MTC.<sup>11</sup> Downturns in economy combined with high fuel prices are allegedly incentives for switching to transit. Clearly this was not the case in the Bay Area during the 2008-2009 recession. Annual transit trips are at a 500 million plateau.

MTC Statistical Summary of Bay Area Transit Operators 7

<sup>11</sup> [http://www.mtc.ca.gov/library/statsum/StatSumm\\_2011.pdf](http://www.mtc.ca.gov/library/statsum/StatSumm_2011.pdf)

This plan ignores that transit is not cost effective and provides only marginal relief to traffic congestion and pollution because of the small portion of the population that chooses it. The plan allocates over 60% of future transportation resources to transit to boost its capacity by 27% whereas roads used by over 80% of the commuters, including bus riders, are granted only a 3% capacity improvement. This plan assumes that past trends will continue into the future and its budget is boundless in terms of subsidies for TODs and other preferential development.

Both of these are fatal errors that ably represent both the disconnect of planning from reality and the mission of transit and planning agencies as government arms for effecting political priorities that have little intention to materially improve the quality of life of the citizens that they represent. None of the alternatives examined address mobility challenges and traffic congestion head-on, therefore none are acceptable.

EIR and Draft Plan Comments

C173-1

**I. Problem:** the plan requires greater #s of in-commuters from outside the region:

**A. How:**

1. By assuming same ratio of in-commuters, a # that will be larger in absolute #s than now (source: query of authority in MTC);
2. By using Cal HCD 'housing need' that derives from Existing Households but not from the Missing Households that for years have been exported to San Benito, Stanislaus, San Joaquin and Santa Cruz;
3. OneBayArea to spend land for jobs but not for housing that will be supplied outside the region

**B. Consequences:**

1. Housing will be more unaffordable than now because prices will be bid up by workers whose demand by design of OneBayArea exceeds housing and land supply;
2. Planning for increased #s of into-region commuters congests roads & contaminates air;
3. Long-distance commuters across air basins may avoid regulatory monitoring that is predicated on individual regions for both air quality and transportation

**C. Remedy**

Voluntarily raise OneBayArea's in-region Housing Need Total to include that share of housing currently exported outside the region:: Best would be to plan for that housing already exported, plus its future Cohort needs; Minimum would be to plan at least for that Future Need for the existing export

**II. Problem:** HCD Under-determined ABAG Regional Housing Need because it makes reasoning and market errors.

**A. How:**

1. Vacant Unit Need miscalculated: :
  - a. HCD admits role of Vacant-Other housing stock but fails to plan for future such need in the housing stock: see its Adjustment #9 in its RHND letter of 2-24-12 corrects for Vacant Other for current
  - b. Furthermore, all categories of Vacancy must be planned in future housing needs because Seasonal & 2<sup>nd</sup> Home stock has proven robust in strong & weak housing markets (study I did for HCD for SanDag)
2. HCD claims 'natural' a 1.5 vacancy rate for owners, a rate untenable in all markets. Instead use vacancy rate correlating to 0 change in CPI-Shelter, **Owner** for this region.
3. HCD calculates 'need' from existing households, not from those households whose need is NOT being met, those who must commute from outside.

**B. Consequences:** Price inflation, long commutes.

**C. Remedies:** in II 1. B and in I.C

**III. Jobs-Housing Balance is Worsened in many counties and for the Region overall: were house prices the target of policy, this ratio would be lessened, not aggravated:**

**Ratio of Jobs-to-Housing, planned to change by 2040**

Source: Jobs-Housing Connection Strategy, Revised May 16, 2012 Bay Area Plan (note: #s from these pages incorrectly summed in those pages)  
 Page 49

|               | 2010 | 2040 |                       |
|---------------|------|------|-----------------------|
| Alameda       | 1.19 | 1.30 | more jobs/hsg         |
| contra costa  | 0.86 | 0.97 | more jobs/hsg         |
| marin         | 1.00 | 1.09 | more jobs/hsg         |
| napa          | 1.29 | 1.47 | more jobs/hsg         |
| san francisco | 1.51 | 1.62 | more jobs/hsg         |
| san mateo     | 1.27 | 1.39 | more jobs/housing     |
| santa clara   | 1.47 | 1.46 | fewer jobs/hsg barely |
| solano        | 0.87 | 1.02 | more jobs/hsg         |
| sonoma        | 0.94 | 1.09 | more jobs/hsg         |
| REGION        | 1.22 | 1.31 | more jobs/hsg         |

**IV.** The Housing Distribution by Income within each county should go beyond what recent law changes require to instead distribute to the Regional Median not each county's median; done the way you have, you've allowed Marin to maintain its high-income privilege.

## Plan Bay Area 2040 Final Environmental Impact Report

**From:** Beverly Wood <[REDACTED]>

**Date:** 5/16/2013 3:21 PM  
**Subject:** Plan Bay Area DEIR

C174-1

I am a resident of the Los Ranchitos area in San Rafael and am very concerned about the speed with which the DEIR is being handled. I am writing to request an extension on the deadline for comments so that cogent, thoughtful responses can be made and the assumptions upon which the plan rests can be evaluated. There are serious, significant environmental changes and impacts of this plan on what is really a rural neighborhood.

Thank you for your consideration,

Beverly Kleinbrodt

Re: Public Hearings for Plan Bay Area DEIR scheduled for April 2013

C175-1

I am writing to request that the Public Hearing scheduled for April 16, 2013 in San Rafael, CA be rescheduled to an evening time. It is not a fair public process to hold hearings as important as this one, during the work day when most of the public is working and can't take time off for a 10AM meeting. I also do not think it is fair that you are allowing the hearing scheduled in Oakland to be in the evening but the one in San Rafael during the morning hours.

If you have some rationale as to why you are holding a day time meeting instead of an evening one, please let me know but this is ridiculous and will exclude a lot of people who wish to attend. I understand we can email or snail mail comments on the DEIR but the most important thing in the EIR process is to get full public participation and show the public that you really do want to listen to their comments and it is also important for us to feel like we are being included and for a lot of people, especially regarding this issue, that means attending public hearings, not just emailing or mailing in comments.

Thank you.

## Plan Bay Area 2040 Final Environmental Impact Report

**From:** Margery Entwisle <n[REDACTED]>  
**To:** <info@onebayarea.org>  
**CC:** <krice@co.marin.ca.us>, <skinsey@marincounty.org>, <peklund@novato.org>  
**Date:** 5/13/2013 4:48 PM  
**Subject:** One Bay Area Plan

I've been reading about the One Bay Area Plan and attended the meeting at Dominican last Thursday evening. I admit to not reading all 1,300 pages of the EIR. However, I have two comments.

**C176-1** From what I've heard and read, it seems to me that this plan is not going to solve the problem that it purports to solve, green house gas emissions. Bob Silvestri had an excellent article in the Patch and I am sure you have all read it. If not, you can find it here: [http://millvalley.patch.com/blog\\_posts/plan-bay-areas-high-density-multifamily-transit-oriented-development-wont-reduce-greenhouse-gas-emissions](http://millvalley.patch.com/blog_posts/plan-bay-areas-high-density-multifamily-transit-oriented-development-wont-reduce-greenhouse-gas-emissions) For myself, I think that the planners are too optimistic regarding leaving cars at home no matter how close to services they put housing. The reality is, I live three blocks and two traffic lights from Whole Foods and I don't walk, I drive. I do try to accumulate my to dos so I cover many stops on one trip out in the car. And, I try to stop at Whole Foods on my way home from someplace else, though I don't need to live near Whole Foods to do this.

**C176-2** Last, I can not believe that planners are planning for greater density in an area where development should be limited due to the frequent scarcity of that critical resource, water. How quickly we forget when there are abundant water years about the pain of rationing. Is it too much to ask for a plan that maintains and supports a status quo that is often on the edge due to the vagaries of nature?

Sincerely,

Margery Entwisle

[REDACTED]

My name is Devilla Ervin and I have been working with New Voices are Rising, for a more sustainable and resilient Oakland, since I was 14 years old. I am now 23.

C177-1

As a young man looking to live on his own I am deeply troubled by the threat of displacement in my community and other areas slated as Priority Development Areas. By underestimating the impact of displacement I feel we are doing a disservice to the entire purpose of the Plan Bay Area. Displacement needs to be at the forefront of this conversation not swept under the table, because we cannot cut down VMT and/or Green House Gas Emissions without dealing with this threat.

Living in Oakland I have known many people who find themselves being forced to leave their homes and communities that holds a sense of

history and family to find housing that is less expensive.

One example of this is my foster mother. My junior year of High School she found a place that was affordable but it was in Sacramento. She was still working in Hayward. She was commuting up to 5 hours a day just to get to and from work.

This is what I fear for thousands of other low-income families with the adoption of this proposed plan in the absence of additional mitigation. By increasing investment in public transportation, affordable housing, and strategies to retain and build businesses that serve the existing

C177-2

community. The Equity Environment and Jobs Alternative (Alternative 5) will go a long way towards addressing these concerns and mitigating the impacts of displacement.

Without careful, conscious, and deliberate planning, more low-income residents will be pushed out to less attractive and more polluted parts of the city while attracting persons who have not historically found these areas attractive. Plan Bay Area should not add to the list of issues

C177-3

residents already have to deal with. Plan Bay Area should be providing solutions and incorporating the strategies in Alternative 5 that makes it the Environmentally Superior Alternative, thus leading to a more sustainable and Resilient Bay Area

**Subject:** Request Sue Hestor and DEIR on Plan Bay Area

IT HAS TAKEN A AWFUL LONG TIME TO GET A RESPONSE to my March 27 email on this.

Is there in between a flash-drive and 2 volumes of text? If there is, I think I want it. I have a sneaking suspicion that I have to have the printed version to have the graphics I need.

THIS IS A PROTEST:

**C178-1** You are putting the expense of printing out the DEIR index etc and relevant graphics onto people like myself. You are assuming that everyone has computers and printers able to do (assumed) color graphics at their home. Is my assumption incorrect?

**C178-2** I already know what I am going to look for. Assumptions on sea level rise, areas which were dry land in 1850, marsh locations, filled areas (THE ENTIRE BAY WATERFRONT) and comparison to maps in SF on where you think growth should go. The illustrations I have seen thus far show extensive development proposed in SF where there were historic marshes. And death in Loma Prieta - although people were more concerned about buildings in the Marina than about deaths or low-income people.

MIRIAM CHIONG - please send this to whoever collects COMMENTS. Do not let it sit in email hell.

If I have to choose between a flash-drive lugging 2 volumes up 4 flights of stairs, please send the flash-drive. I ASSUME THAT IT IS TOTALLY INDEXED SO THAT I DON'T HAVE TO WAIT AN EXTREMELY LONG TIME FOR THE ENTIRE DOCUMENT TO DOWNLOAD.

My mailing address for your record is:

Sue Hestor

[REDACTED]  
SF 94102

Because of the extraordinary delay in answering my last email - PLEASE ACKNOWLEDGE THAT THIS WAS RECEIVED.

## Plan Bay Area 2040 Final Environmental Impact Report

**From:** <[REDACTED]>  
**To:** <info@OneBayArea.org>  
**CC:** <peklund@novato.org>, <SKinsey@co.marin.ca.us>, [REDACTED]  
**Date:** 5/14/2013 1:37 PM  
**Subject:** Plan Bay Area Draft EIR Comments

**C179-1** Regarding projected future greenhouse gas emissions I believe it is artificial and unrealistic for you to ignore the adopted National Fuel Efficiency standards (see pages 2.5-23 and 3.1-62) for cars and light trucks beginning in 2017. According to the EPA and the White House, these requirements will result in about 50% lower greenhouse gas emissions from cars and light trucks in 2035 compared to 2005 (even with expected increase in car population and vehicle miles travelled). This reduction will far exceed relatively small GHG decrease from changes in land use and transit patterns in the proposed plan.

**C179-2** In contrast I note that you take credit for the impact of new automotive technology in projecting that most emissions which impact air quality will decrease by 2040 (see page 2.2-26).

For the sake of your credibility and the acceptance of Plan Bay Area, I hope you will recalculate GHG emissions taking into account the adopted standards.

Association of Bay Area Governments  
May 14, 2013  
Metropolitan Transportation Commission  
Joseph P. Bort MetroCenter  
101 Eighth Street, Oakland, CA 94607

RE: SCH #2012062029 Plan Bay Area DEIR

Dear Sirs and Mesdames,

It is with some hesitation that I submit comment on your Draft EIR Plan Bay Area of April 2013 as with only a few days time for review, have not begun to properly read the fine print or understand all that is proposed.

**C180-1** Initially, it would seem that Alternative 4, Enhanced Network of Communities, contains the most promise for addressing the full spectrum of local land use protocols that distinguish various Bay Area towns and cities.

In consideration of State Assembly Bill 32 which Act, I believe, urges communities to seek climate change and global warming solutions, each city and town council has plans as to how best to accomplish this end. To lessen dependence on cars they hope to ensure safe walking and cycling access for children to schools, and for residents to neighborhood coffee houses, restaurants and stores. It is a simpler sustainable life style.

Along with reducing the community's carbon footprint there needs also be maximization of vegetation, tree canopy, parks and open fields and grasslands to sequester carbons in a natural, functional manner. Each community is responsible to endeavor to accomplish this with a formula suitable to their citizenry and locale.

**C180-2** With this basic premise, it is important that regional government regulatory agencies as ABAG and MTC do devise land use plans or impose a highway network that divide neighborhoods or overload a region with traffic to a degree which makes it impossible for that community to reach a sustainable balance of carbon footprint.

Likewise, in the democratic concept of responsible civic action it is essential that there be schools, libraries, police, fire and resource elements available in the existing and attainable infrastructure, before high density populations be allocated to a town or city. Water supply and sewer capacity rank foremost in this concern.

In short, I believe that there is a threshold that should not be exceeded in density of development, not only because it outstrips both available and conceivable resources, but it so drives up the cost of living in a region as to outclass many of its older residents who then have no place to go. In this regard please reference latest US Census for San Mateo County which shows rise of up to 12 percent from 2011 of people living in streets, vehicles or encampments. Think if you check Santa Clara County you will find conditions similar if not worse, to a degree which makes recreation trails and facilities unsafe from human health and safety standpoint.

But on to my intended comment on your Plan Bay Area DEIR and the base data that it references.

**C180-3** ~ P. 2.8-38 cites an absence of any history of tsunamis in San Francisco Bay but neglects to mention the San Francisco District, US Corps of Engineers' "San Francisco Bay Tidal Stage vs. Frequency Study of October 1984" which computes wave ride-up from the Golden Gate to South Bay as being 2 1/2 feet. As this is added to a 24 inch rise in Bay levels anticipated with global warming, believe you have a more significant high water condition threatening highway infrastructure of South Bay, as well as low lying communities.

**C180-4** ~ In implementation of AB 375 streamlining of public works projects I had

hoped MTC would have placed simple padding up of highways that run along San Francisco Bay as a top priority. This would include #101 especially near airport, and in Palo Alto where portions of bay were filled to accommodate roadway, #237, #37 in Marin/Sonoma and #12 in Napa, and #580/#80 along Berkeley shoreline. This is a deficiency in DEIR.

**C180-5** ~ Extensive proposed highway projects cited in document are growth inducing without appropriate support documentation regarding sustainability or capability to reduce carbon footprint. As latest reports that levels of carbon dioxide have reached an average daily level above 400 parts per million, an amount of gas in air that has not been this high for at least 3 million years, do not think this 'business as usual' plan is acceptable. The Bay Area has to entirely rethink its lifestyle and all modes of transportation not only for its own survival, above water, but as responsible member of the international community where millions of people are at risk. MTC needs to be looking at canals rather than highway overpasses, and extended marshes not clover leafs. Think all must go back to drawing board. What acreage of marsh is needed to satisfy carbon sequestration?

**C180-6** ~ Liquefaction needs to be more closely evaluated in baylands, in delta sediments between Guadalupe River and Coyote Creek, and particularly in Redwood City and at #92/#280 interchange which USGS rated high.

**C180-7** ~ Earthquake faults seem not sufficiently addressed with conservative design criteria. Have I missed this?

**C180-8** ~ FEMA has unaccountably not updated its old 100 year floodplain maps with global warming, high intensity storm criteria and for this not to be available for your Bay Area Plan documentation is a critical deficiency. In Santa Clara County there are at least 14 tributaries along #85 in South Bay that can impact stream levee freeboard and adjacent roadways. Mt. Umunhum and Mount Hamilton add a definite dynamic to storm flows.

**C180-9** ~ Please note that the Santa Clara County HCP did not include fisheries or Peninsula habitat conservation so your species lists are not as inclusive as they need to be. To project species and their habitat for the next forty years is a flawed concept in consideration of shifts in populations due to climate change. Also survival of certain species may be critically altered.

**C180-10** ~ Wildlife corridors need to be addressed in regards accommodation by highways. When #37 and #12 are padded up they should include undercrossings for wildlife and as #101 extends in south Santa Clara County to #192 it intercepts Diablo, Santa Cruz and Gabilan Mountain Ranges so needs elevated wildlife crossing. In this DEIR gene pool sustainability throughout Bay Area must be reviewed for flora, fauna and fisheries.

**C180-11** ~ In evaluation of highway upgrade impacts, air quality nitrogen deposition is paramount consideration in that it induces non-natives to intrude on serpentine grasslands and this impact is accounted for in your DEIR in regards integrity of habitat for local species of Bay Checkerspot Butterfly. However, do not believe increase in fuel load is addressed as fire hazard on open space lands and it needs inclusion as management concern.

**C180-12** ~ Chemical alteration in plants and creation of invasive hybrids due to automobile pollutants is exacerbated by road expansion in and adjacent to wetlands and marshes with phragmites and spartina high on list. This needs to be assessed in DEIR with recommended width for vegetated buffer lands management protocols. Highway earth moving equipment has contributed to transmittal of invasives, such as arundo, into stream ecosystems and this should be avoided if appropriate maintenance is specified.

**C180-13** ~ In assessing impacts on wetlands DEIR documentation does not specify as to linear impacts on riparian corridors, canopy and stream bank wetlands vegetation except to roughly mention overall mileage. Acreage seems to be criteria for marsh impacts but on that am unclear. Would like to get back to you later on this.

At this time will submit these comments of a more general nature. However, would appreciate an opportunity to comment with more substantive detail later in week. There is a great deal to absorb in this Plan Bay Area.

## Plan Bay Area 2040 Final Environmental Impact Report

Thank you for your kind consideration in forwarding this document and reviewing my comments.

Sincerely,

Libby Lucas

**Date:** 5/21/2013 4:23 PM  
**Subject:** Draft EIR Plan Bay Area SCH #2012062029

Association of Bay Area Governments  
Metropolitan Transportation Commission

Dear Commissioners and Staff,

Herewith is my last submittal on One Bay Area Plan, and hope these charts of collateral damage by project number are somewhat legible.

**C181-1** Have pleaded this extension due to lack of DEIR availability in neighborhood libraries - Palo Alto - Los Gatos as assured in public relations releases. Your staff kindly did mail me hard copy which received a week ago but it is sufficiently complex that still feel somewhat vague on future implications.

**C181-2** Major DEIR deficiency is in regards impacts to habitat of federally listed species and special status species in Santa Clara County is that only approved HCP did not cover north third of county or fisheries throughout county. In particular this DEIR neglects red-legged frog, tiger salamander and western pond turtle colonies and is light on cold water fishery streams.

**C181-3** Wetlands impacts are extremely hard to assess at this level as depth of riparian corridor or width of stream are not detailed, and they are critical factor especially in consideration of SRA needed for viable cold water fishery. Summation of impacts in acreage or miles seems underestimated and not sufficiently site specific..

**C181-4** Had thought that State policy was that wetlands impacts needed to be mitigated to level of 'no net loss' and as do not find this in main body of text or in Appendices, feel this too is a major deficiency in DEIR.

Thank you for consideration of my continuing concerns.

Oakland, California 94607  
eircomments@mtc.ca.gov  
Re: Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft  
Environmental Impact Report

To Whom It May Concern,

My name is Deirdre O'Brien, I am a resident of Marinwood, located in unincorporated Marin County. I support and adopt a letter to you by a fellow member of my community, Lisa Culbertson as follows:

I am writing to comment on the Draft Plan Bay Area (The plan) and Draft Plan Bay Area Draft Environmental Impact Report (DEIR). I submitted a request for an extension of time to review the Plan and DEIR, which was not granted. These are complex and difficult documents for ordinary people to understand. The level of communication with the communities you are impacting by this plan is disgraceful. The plan includes a statement, "We reached out to the people who matter most – the 7 million people who live in the region." This is inaccurate as it pertains to my community, Marinwood, designated as a potential Planned Development Area (PDA). Many members of the Marinwood community do not know what Plan Bay Area is and for most that do, they have only heard about it in the past few weeks. I attended one of two planned meetings in my community where there was no verbal presentation or explanation of the plan, but rather boards and remarks from the public. I ask that you reconsider this fast track approach and take the time to educate the community on exactly what it is that you are proposing in this plan and why.

I support truly sustainable land use and development that preserves the qualities of existing neighborhoods. I support additional affordable public transportation that reaches a greater range of areas throughout the Bay Area and operates more frequently with longer hours. I also support a range of housing opportunities, integrated into existing communities that do not adversely affect those communities through expediting environmental and permit review and not contributing a fair share to the tax base. None of these things are supported by this plan and therefore you do not have my support. I vote for no plan and ask that you remove Marinwood as a potential PDA designation.

Although I am writing this letter representing myself, I have spent the past two weeks walking door to door gathering signatures against the proposed development plans affecting Marinwood and Lucas Valley. 90% of the homes visited by myself and fellow neighbors are NOT in support of this plan or the related Housing Element. Since this plan is voluntary and you do not have the support of the Marinwood/ Lucas Valley community I ask again that you remove Marinwood as a potential PDA designation.

I have grave concerns about the environmental, health and safety impacts that could result from the poor land use planning that I see presented in this plan as well as other related plans, such as the Marin County Housing Element. There are numerous holes and inconsistencies in the Plan Bay Area and DEIR which are the basis of my comments that follow:

Unrealistic employment growth

Projected employment growth in Marin County is half of what is being proposed for housing growth. The largest Bay Area job growth is assumed in major cities and areas such as Silicon Valley that have established industries such as technology. Marin County is not known for any specific industry. For its size, Marin County has very few large scale employers and a low number of high paying jobs compared to the number of residents and high cost of living. The potential growth in local employment projections are assumed to be coming from professional services and retail.

Marin had the largest job growth from 1980 to 1990. In 2011, employment levels were about the same as they were in 1990. There are documented studies that project a relatively flat growth in jobs in Marin County over the next 30 years. The lack of consistency and equality between the housing and job numbers projected in Marin County will lead to more commuters, thus increasing green house gas (GHG) emissions as there will not be enough jobs for the number of residents moving into the county. This will hurt the workforce that these plans aim to protect as there will be more competition for available jobs and low income earners will not have ample salaries to pay for the high price of transportation to travel to employment throughout the Bay Area.

The lack of continuous transportation will also affect quality of life for those depending on public transportation as it can take hours to get from point A to B if multiple modes of transportation are to be used. In addition, the Housing Element appears to designate almost every available parcel in Marin for housing, not leaving properties available for commercial development. Furthermore, the proposals for mixed use projects do not have an equal balance between jobs and housing.

The discussions around new jobs in Marin have been more focused on filling vacancies than creating new development. This does not leave opportunity for the creation of jobs in areas where housing is being considered. A perfect example of this is the Marinwood area, which has minimal jobs in the near vicinity and yet the projected housing number far exceeds any potential commercial development within the area. Due to the fact that job growth in Marin will likely remain flat and the available capacity for jobs to increase is unlikely, I ask that The Plan Bay Area be revised to include realistic employment projections by area and a specific plan for achieving those projections. I ask that the plan take into account not only the workforce commuting into Marin County for employment, but all commuters into, out of and through Marin County. The approach taken in this plan is shortsighted and not representative of all current commute patterns.

Unrealistic Housing numbers

Like the job numbers, the housing numbers also appear to be unrealistic. The January 2013 release of the State Department of Finance (DOF) projections of Marin County's population growth are 10% lower than the growth forecast used for Plan Bay Area. Plan Bay Area forecasts a 13% population growth to 2040 (32,914 more people) but DOF projects a 3% population growth (6,818 more people). This is a significant discrepancy. The Plan Bay Area and the DEIR should be revised to reflect population growth based on DOF projections, not that of an independent consultant hired by ABAG.

The plan needs to include an assessment of the total cost to the County and taxpayers incurred by adding housing. This assessment should include additional services (schools, water, fire, police, ambulance...) and the total cost of development including subsidies to developers and loss of tax base.

The housing assumptions do not reflect accurately the desire of a large group of people to maintain living in rural areas and in single family homes. It makes the assumption that the future housing preference is high density, mixed use housing, located in urban areas. While both are desirable to different groups of people, the plan is not representative of all type of housing desires. I request that the plan be modified to accurately represent the desires for all types of housing.

Inadequate evidence that high density housing near transit reduces green house gases (GHG)

Not only is there no evidence provided that proves placing housing near transit reduces GHG, there is also no analysis validating assumptions that people who move to high density housing near transit will be more likely to take public transit. These ideas or goals focus too much on strategies, which are not valid, and should be substantiated with factual information.

This plan does not take into consideration accurate travel needs, preferences and behaviors and the fact that for many people the preferred mode of travel is by car. The plan does not indicate what other studies have been put forward other than a "one size fits all" determination made by the authors of this plan stating how people are expected to travel. This makes grand assumptions that are unrealistic and should not be used as the basis of such a widespread and impactful plan.

I ask that you provide the analysis to prove that the housing near transit lowers GHG emissions, at what cost and what other options are available to achieve the same results.

Inadequate evidence that the transportation plan reduces GHG

It seems that there are other ways to reduce GHG emissions that should be analyzed as having a potentially more significant impact on reduction than what is being proposed in Plan Bay Area. These options include considering the future automobile technology and incentivizing individuals for the highest fuel efficient cars. Focus on creating a much higher number of localized jobs in Marin County to allow for more existing residents to work close to home rather than just focusing on housing for those commuting into Marin.

Further studies and factual information should be presented to substantiate that switching people from cars to public transit will in fact decrease CO2 emissions, rather than increase emissions. More information is needed on the types of transportation being proposed and a comparison between the emissions from the public transit vs. cars. The Plan focuses on GHG emissions from personal vehicles and light trucks and does not focus on technology improvements made to other forms of transportation including busses, ferries, trains, etc. An assessment should be performed on the potential for reductions by replacing fleets of other modes of transportation and the cost benefit should be analyzed against the plan as currently proposed.

The plan identifies that the "no project" alternative is projected to reduce passenger vehicles CO2 emissions by 23% by 2040 over the existing condition in 2010. The proposed alternative, which is costly and intrusive into basic economic and personal freedoms, is projected to reduce emissions by 25%. The plan does not consider if this extra 2% is worth the additional costs. I ask that a cost benefit analysis be prepared and incorporated into the findings, which includes other options to reach the additional 2% GHG emissions.

Inadequate evidence that placing high density housing next to major transportation corridors will not have significant adverse health effects on those residents.

The Plan proposes placement of housing along transportation corridors, where the objective is to locate jobs and housing in close proximity to each other, with the goal of reducing automobile trips and therefore mobile source emissions. However, in doing so sensitive receptors will be exposed to unhealthy levels of toxic air or particulate concentrations. The DEIR does not provide adequate mitigations to protect sensitive receptors, especially those spending time outdoors, such as children playing outside. The DEIR states: "New research on the health effects of TACs and PM2.5 reinforces earlier findings regarding adverse health impacts on both respiratory and cardiovascular health but also a wider range of potential effects, such as diabetes, autism, cognitive functions in older adults, and oxidative damage to DNA. In addition, US EPA has not identified a level of TAC/ PM2.5 concentration where no negative health effects are observed." There are

many reports not disclosed or discussed in the plan that identify causal links between proximity to freeways and highways, asthma, autism and cancer. This should be highlighted as a risk in the plan and study references included.

Implementation of Plan Bay Area would subject sensitive receptors to a significant increased risk of developing life-threatening illnesses from toxic air contaminants and particulate matter emissions. Furthermore, the measures listed to mitigate these significant impacts are inadequate to reduce them to less than significant levels, particularly in regard to protecting sensitive receptors that spend time outdoors. Plan Bay Area's proposal to target residential development in close proximity to highly travelled and congested roadways is irresponsible land use planning and conflicts with CEQA. Case law clearly shows that CEQA is intended "to compel government at all levels to make decisions with environmental consequences in mind." I ask that you revise Draft Plan Bay Area and remove all proposed residential development from areas that are located within the zone of influence of toxic air contaminants and/or fine particulate matter emission sources

and remove areas situated within the zone of influence of these emissions from Transit Priority Project corridors, Priority Development Areas and Potential Priority Development Areas.

Plan does not sufficiently consider that traffic congestion adds to CO2 emissions

The Plan Bay Area does not consider cumulative effects of increased localized traffic. The lack of expansion of the road network will cause an increase in traffic congestion as areas grow more dense. Instead the methodology of this Plan places an over-emphasis on public transit. In reality, congestion will increase, and the resulting standing or slow traffic will cause additional CO2 emissions per passenger mile for the most used form of transit cars and light trucks.

Furthermore the plan does not adequately take into consideration the impact of the time wasted from traffic congestion and the effects on quality of life. The Plan Bay Area does not account for typical family life, taking children to and from school, sports, errands, etc., it only focuses on trying to change the norm. Congested roadways will result in a reduction in the distance that most residents can effectively commute, due to time and family constraints. This in turn means that people are less able to find employment within an acceptable distance.

I ask that the Plan Bay Area be revised to take into consideration additional, localized traffic especially in areas where increases in housing are not balanced with job growth.

Plan fails to disclose subsidization required to encourage residents to move to high density development near transit

The Plan Bay Area fails to identify the true amount of subsidization required to encourage builders to develop high density housing. A survey by the National Association of Realtors in 2011 reveals that the vast majority of Americans prefer to live in single-family homes with privacy and yards.

Evidence exists that subsidies are required in order to encourage people to move to high density housing. There is no analysis included in the Plan to validate the amount of subsidization required to encourage developers to initiate and complete such projects and residents to move into them.

This lack of specificity means that an undefined amount of public money, via state, county or city, will be used to reach the goals of this plan.

## Plan Bay Area 2040 Final Environmental Impact Report

The plan does not alert readers to rising taxes needed to raise revenue to cover these subsidies. Alternatively the plan does not provide sufficient analysis of impacts to services such as police, fire and schools. In addition, there is no evidence that the expenditures covered by the plan will achieve the stated goals.

Inadequate information re: water supply, sea level rise, and support for infrastructure

There are 5 significant, irreversible environmental changes, and 39 significant unavoidable impacts of the plan, identified in the DEIR, that should be addressed and mitigated before this plan is accepted. They should not be dismissed with findings of "overriding consideration." If the organizations that are proposing to implement this plan cannot address these serious affects than perhaps that is a sign that this is not the right plan for the Bay Area. The impacts I am referring to include:

- Insufficient water supply;
- Exposure to hazardous materials;
- Inadequate wastewater treatment capacity;
- Net Increase in Sensitive Receptors located in Transit Priority Project corridors where there are high concentrations of cancer causing Toxic Air Contaminants and fine particulate matter emissions;
- Inundation from sea level rise;
- Direct removal, filling or hydrological interruption of habitat;
- Interference with the movement of native resident or migratory fish or wildlife species.

Plan Bay Area Approval

It is unclear to me how the Plan Bay Area ultimately gets approved and implemented. I request that this be clarified to the population impacted by the Plan. Is the plan subject to voter approval?

Conclusion

The Draft Plan Bay Area's DEIR is inadequate in numerous instances identified in this comment letter. ABAG must prepare an EIR that adequately analyzes the plans significant impact and meets CEQA guidelines. The conclusions are not supported by substantial evidence. The key assumption regarding population and job growth is inaccurate. A revised EIR should be prepared and circulated for public review and with ample time given to the public to comment.

Thank you,  
Deirdre O'Brien

EXECUTIVE DIRECTOR'S OFFICE

Re: Comment on Final Draft Plan Bay Area

Dear Mr. Luce:

C183-1

The ABAG Mission Statement states:

*ABAG is committed to enhancing the quality of life in the San Francisco Bay Area by leading the region in advocacy, collaboration, and excellence in planning, research, and member services.*

As local officials, we need to be able to think and talk through options that deal with the very real problems we face. California is in the midst of a sometimes troubling demographic transition and we look to ABAG to help local communities explore the consequences of these changes. As presented to us, Plan Bay Area does not allow us to discuss the most important of these issues.

The stated goal of the Plan is to help local communities chart a course to accommodate change while “fostering an innovative, prosperous and competitive economy; preserving a healthy and safe environment; and allowing all Bay Area residents to share the benefits of vibrant, sustainable communities.” (Draft Plan Bay Area, March 2013, Page 1). But the Plan presents and imposes on us only a single long-term demographic projection. This severely limits our ability to plan effectively for a changing future.

Plan Bay Area asserts a single demographic view of the future, a view that it calls the “the best picture we have of what the Bay Area may look like in 2040” (Page 5). It projects a population growth of 2.1 million people in the Bay Area in the period 2010-2040 (Page 6). This demographic assertion is the starting point for each and every public discussion of the Plan. But this ‘best picture’ projection is some 60% higher than the forecast of the State Department of Finance's Demographic Research Unit—a group set up “to serve as the single official source of demographic data for state planning and budgeting” (California Department of Finance website). That group projects a Bay Area population increase of only 1.3 million by 2040. (Population Projection P-1, Demographic Research Unit, California Department of Finance, January 2013).

Up until 2012, ABAG had relied on the Department of Finance's population projections as the basis of their own forecast. But ABAG moved away from that long-standing relationship when the 2010 Census showed a rather dramatic slowdown in California's, and the Bay Area's, population growth. In early 2012, a detailed analysis of California's population slowdown during the 2000's led the Department of Finance to revise its longer term projections in the areas of births, domestic migration and international migration. Instead of leading a public discussion of

the implications of these important demographic shifts, ABAG turned to an entirely new model based on a US Department of Labor forecast. The selected Labor Department forecast not only didn't show a decrease in projected population following the official Census Report, they instead posited a substantial increase (see the articles detailing the Department's long-term population and labor projections in US Department of Labor, *Monthly Labor Review*, November 2006 and October 2012). This was not just a phenomenon of ABAG's taking a national perspective rather than a local one. The US Census Bureau (which carries the federal responsibility for population estimates) made the same adjustments on birth rates and migration rates that California's Department of Finance did (reducing their national population projections for 2040 by some 34%). In fact, the Census Bureau actually published a short paper explaining why their longer term projection had changed so dramatically between 2008 and 2012, "What a Difference Four Years Make: US Population Projected to Grow at a Slower Pace" (US Census Bureau Blog, December 12, 2012)

In fact, most professional demographers are projecting a slower pace of population growth in coming decades at both the national and state level as they re-examine birth rates, domestic migration and international migration. Yet ABAG is ignoring the possibility of a downward change. While there is room for disagreement and alternate scenarios, it would certainly be helpful for ABAG in their role of fostering excellence in local planning to help local communities explore some of the reasoning behind those changed projections and the consequences for decisions local officials make.

Let me mention a few of the most important of those shifting trends that might have significant impact on the longer-term decisions local governments make:

- Over the last ten years, California has averaged a net domestic out-migration of over 150,000 people per year. That adds up to a loss of over a million and a half California residents over the decade. Who are these migrants? According to the Department of Finance, the largest outflows are those aged between 30 and 45; the next largest group is young kids under 10 years of age. These are young families leaving the state. About two-thirds of the adults leaving have gone to California colleges. These are middle class young families.
- Because of the dramatic loss of young families, California is the only state west of the Mississippi that has a declining number of children under the age of 10.
- San Francisco is a special case with the share of children between the ages of 5 and 17 the fastest declining age group.
- The high cost of property in California is certainly one key factor in these changes. It has not only contributed to the out-migration of young families but it has sharply curtailed international immigration to the state over the last decade. Demographers have noted that net migration from Mexico to California is now close to zero.
- The absolute number of California residents admitted to the UC system has been falling for the last two years.

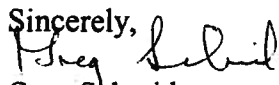

As elected officials, we are confronted with these indicators that point to a state that faces a shrinking young middle class. These are our kids, our grandkids, who are leaving.

Responding to demographic changes requires investment by local communities. We would like to create affordable housing and jobs that keep our young middle class families in the community. We need to invest in schools and day care centers and parks and recreation programs and libraries that form an affordable and attractive community. At the same time we have to maintain streets and sidewalks and our aging public buildings. Yet you are asking us to invest more of our funds in building homes in Priority Development Areas to meet a possible influx of new residents and jobs. While it makes sense to assure that our communities remain diverse and vibrant, speculating on possible rapid growth rates is expensive. Each 'affordable' house, for example, carries a substantial subsidy in our high priced communities. As an example, each new low income housing unit in Palo Alto carries a public subsidy of between \$100,000 and \$400,000. And this is without the additional public funds needed for infrastructure support for things like schools and parks and roads and security.

As Council Members we are facing severe demands on our existing budgets. We are willing to spend to build affordable housing. But we are struggling to pay rising benefits and pensions to our workers who provide basic services and it is difficult to find new funds to invest in our existing schools and child care facilities. At the same time we are confronted with a constrained tax system. Our main source of local revenue, property tax, grows slower than the California economy under Prop 13. A key element of that slower growth is the fact that each year businesses share of property tax payments declines because of a special Prop 13 exemption.

When we draw the 'best picture' of our demographic future, it is imperative that we make sure that we include the best thinking of the many professional demographers available to help us sort through our options and choices. It doesn't help us to be presented with only the most aggressive growth scenario and to hear at the beginning of each public meeting "By statute, the Regional Housing Needs Determination cannot be changed".

If existing statutes stand in the way of exploring realistic demographic change, please help us change the statutes. If Prop 13 constrains all the choices we have, identify it as a problem for us. Help us explore the full range of demographic changes we face and what options we have to use our scarce resources so that we can truly excel in "planning, research and services" to our constituents.

Sincerely,  
  
Greg Schmid

Pamela Tapia

Berkeley, CA 94705

My name is Pamela Tapia.

C184-1

I'm a student at the Peralta Colleges. I write to urge you to modify the Proposed Plan to increase the level of funding for transit and for affordable housing to levels included in Alternative 5, and to also adopt the other anti-displacement measures in Alternative 5. Without more investment in affordable housing and other anti-displacement policies, displacement will occur, forcing longer, more expensive and more polluting commutes on low-income residents

In September of 2011, my mother lost her minimum-wage job. Her factory decided to pack up and move to South Carolina. As a single parent raising two kids, my mom depended on that \$280 a week to pay the \$700 rent on our apartment on the West Oakland-Emeryville border. She spent most of her check on housing and transportation.

She decided to move our family to the Central Valley where an apartment was half the price of our former home. But there are no jobs in the Central Valley—well, not any place where she was qualified to do the work. She had no option. She had to go back to do the same thing she had always been doing. After almost four months of desperate job-hunting, my mother found a job in a factory in Union City's industrial park.

My mom now lives in Manteca but has to commute to Union City for work. What used to be a 30-minute ride from our apartment near MacArthur BART turned into a 4-hour commute. Since she doesn't have a car, she must take the bus from Manteca to Stockton, from Stockton she must take a \$20 Amtrak train to Richmond, from Richmond must pay \$5 to get on BART to Union City, from Union City BART she must catch another bus to her workplace -- bringing the total to almost \$60 a day to just travel for work.

At a rate of \$8 an hour, working 8 hour shifts, she would make an approximate of \$64 a day, but would spend \$60 just on transportation A DAY.

She literally could not afford to get to work. To avoid spending so much money traveling, she determined that she would have to stop traveling. During weekdays, she would sleep in the BART trains, riding the train until the end of the line, getting off and riding it back on the opposite direction, even sleeping on her job's cafeteria floor or on someone's couch.

I felt awkward when I first wrote this. I am not asking for your pity. That is not my goal but these are the facts. This happens.

C184-2

The proposed Plan assumes that displacement will not result in increased rates of in commuting from outside the Bay Area or cross commuting between counties. This assumption is not supported by historical trends and does not agree with my own experience.

I urge you to increase funding for affordable housing and transit, and support other anti-displacement measures, to avoid placing more Bay Area residents in my mother's current position.

## Plan Bay Area 2040 Final Environmental Impact Report

**Subject:** Planning For Reality: Plan Bay Area – A Recipe for Transit Disaster

Esteemed Representatives, planners, politicians and bureaucrats,

The analyses below show that Plan Bay Area holds less water than a sieve. It is a travesty. I realize none if you is really interested in anything but pushing it through. At this stage, however, I suspect - and very much hope - you will fail because this Plan is fundamentally flawed and people are becoming more and more committed to making sure it does not go forward. And when all the facts are put on the table publicly, I would not like to be in your position of looking foolish, at best.

Cheers, A. McEwan

C185-1

Mill Valley Patch  
- Richard Hall | May 7, 2013

### PLANNING FOR REALITY: PLAN BAY AREA – A RECIPE FOR TRANSIT DISASTER

Plan Bay Area proposes laudable goals such as reducing CO2 and improving transportation across the entire region. However it places a great emphasis on switching people to using transit and makes leaps of logic that dissolve under scrutiny exposing that the plan may in fact increase greenhouse gas emissions.

#### False Goals: Reducing CO2 Emissions, But Only for Cars & Light Trucks

Climate change is happening, it's bad and we need to do something about it. As a former European I was dismayed that the Bush took no part in Kyoto, but thanks to Obama the US is board and no longer in a state of denial. But the execution to achieve greenhouse gas reduction is being broken by distorted goals.

The real goal should be to reduce CO2 emissions, period. But somehow the state of California, through Senate Bill 375, and as a consequence Plan Bay Area has instead focused only on the goal reducing CO2 emissions for cars and light trucks. Transit gets a free pass - based seemingly on the assumption that switching people from transit to cars will reduce CO2. This assumption does not stand up to scrutiny...

#### Spending Billions to Make Tiny Impacts (Even if Assumptions are Valid)

Assuming that this goal is valid here is how Plan Bay Area lines up:

##### CO2 Emissions

(Metric tons) Existing Conditions  
2010 Alternative 1

No Project

Alternative 2

Plan Bay Area

Alternative 5

"Equity, Environment and Jobs"

|                             |            |            |            |            |
|-----------------------------|------------|------------|------------|------------|
| Passenger Vehicle Emissions | 19,383,000 | 14,970,000 | 14,631,000 | 14,427,000 |
|-----------------------------|------------|------------|------------|------------|

|                          |      |      |      |  |
|--------------------------|------|------|------|--|
| %CO2 reduction from 2010 | -23% | -25% | -26% |  |
|--------------------------|------|------|------|--|

Remember transit and other CO2 emissions are not included in the stated goal. So even focusing on cars and light trucks Plan Bay Area achieves just a 2% reduction beyond inaction, and the so-called "Equity, Environment and Jobs" achieves only 3% reduction.

The reason for such tiny reductions is that cars have become increasingly greener, and Obama mandated mpg targets (which directly correlate to CO2 emissions) are making the vehicle fleet greener every year.

#### A Tiny Reduction in CO2 at Massive Cost

But what does this small incremental reduction of Plan Bay Area and Environment really cost:

a massive program of investment in transit costing billions of dollars

extensive development of high density housing near freeways and railway lines that assume that people will live there, or subsidies will be spent to make them sufficiently attractive (which will be very high in Marin due to cost of land)

significant increases in asthma and autism (including potentially deaths) cause by proximity of "sensitive receptors" (families) to diesel particulates, ozone and other pollutants

increases in property taxes to support the additional populations' needs around police, fire, water (in Marin this is likely to mean desalination plants) and schools

OR decreases in services levels

urbanizing swathes of Marin with 4-5 story buildings that turn otherwise suburban neighborhoods of single family homes into dark alleys

overlooked by tall buildings

What dismays the author the most is that so much effort is made to suggest that Plan Bay Area, or more so the "Equity, Environment and Jobs" alternative is best for the low income groups, when precisely the opposite seems to be the reality.

A quick Google reveals dozens of studies linking proximity to freeways (where the plan will place so many new high density homes) to adverse

health risks.

Here is one such study by the LA County and Southern California Medical Center, University of Southern California Keck School of Medicine: "Residential Proximity to Freeways is Associated with Uncontrolled Asthma in Inner-City Hispanic Children and Adolescents"

Myth: High Density Residents Will Take Transit

Then there is the other major leap of faith of Plan Bay Area: the residents of the new high density housing near transit will actually be more likely to take transit.

Only looking back in history a short amount of time and to nearby Portland exposes this as a myth.

The city of Portland has conducted just the same kind of highly aggressive "compact infill development" policies as Plan Bay Area, combined with significant transit investment. The transit cost \$3bn and the subsidies required to encourage building and habitation of this housing was another \$2bn (guess who paid for that). The results were that in downtown Portland the share of weekday commuting on transit actually fell from 46% of trips to 36% during the past decade (according to annual surveys done by the city auditor).

Review of Plan Bay Area presents no valid evidence of a causal link, or to use the technical term "sensitivity analysis".

Myth: Transit Produces Less CO2 than Cars

Despite what people would like to believe, transit, especially trains such as the SMART train, does not use less energy or produce less CO2 emissions than current generation automobiles, let alone the upcoming improved automobiles that are the more valid comparison. For instance a train bought today is likely to have a 30 year lifespan before replacement, so it must be compared to the likely emissions of a car or light truck of 15 years in the future.

Many of the myths around transit being "greener" than cars are built on misleading or false assumptions. For instance a full bus may well emit less CO2 per passenger mile than a car, but in the US in 2006 the average passenger load of a conventional bus was 9.2 passengers. Meanwhile while there may be many single occupant cars the average load of a car was 1.58 in 2006 (and HOV lanes since 2006 have encouraged this number to go up).

Another key consideration is that buses must drive from the depot to the start of the route and also return at the end of the route. Whereas car journeys do not have the same overhead – people drive from A to B.

Ultimately transit consultant Thomas Rubin concludes in his paper "Does Bus Transit Reduce Greenhouse Gas Emissions" that buses emit more CO2 per passenger mile than cars and light trucks.

Rail is even worse. Railway lines require sizable efforts around construction; they require feeder buses that tend to have low ridership. As a result Randal O'Toole of the think tank the Cato Institute concludes in his paper that most rail transit lines generate more greenhouse gases than the average passenger automobile.

Neglect of Highways will Cause Increased Congestion and CO2 Emissions

Finally Plan Bay Area places such a great emphasis on transit, and de-emphasizes highway investments that it will encourage congestion - and cars are at their worst emitting greenhouse gases in congestion. And it must not be forgotten that all the thousands of new residents that the plan anticipates will be adding cars to the freeway and not taking transit (see the Portland evidence referenced above).

So What is the Solution?

Living in the high tech Bay Area the visible strides in car technology are becoming self-evident. Cars can now park themselves, they keep you in lane when you drive on a freeway. Google has cars that have safely driven themselves over 700,000 miles (more than most people drive).

The answer is that we are fast approaching the day when you can drive onto a freeway, hit cruise, and your car can "chain up" to other cars that are being computer driven.

The consequences of chained, computer driven cars is that freeway capacities increase four-fold. So once again - is the massive cost of Bay Area, even if it achieves the stated benefits truly worthwhile?

Do planners understand that low income people need to get to work on time like everybody else? They often don't have the luxury of commuting to a dense commercial hub. They may be restaurant workers, landscapers and cleaners that need to arrive early on the job and at locations not easily served by public transit. This is the reality. Planners need to get real. The car is here to stay. With cleaner vehicles, it is far more "carbon neutral" and efficient than mass transit.

The more I read about the Plan Bay Area, the more I get the feeling that the Plan is more about a "Plan to Equalize Marin" with the rest of the bay area.

And, how does cramming in more high density apartment buildings into an already built out section of Marin in the urban corridor help Marin? I totally believe all the statistics in this article, especially about the medical problems associated with living near freeways and busy downtown streets.

That is a way of life in most of the bay area now, but most of Marin is different and will always remain to be.

To me, this Plan is nothing more than a scam to build more apartments in the urban corridor of Marin. What will happen if it is implemented is the existing people who live far away from the urban corridor will simply avoid the new mess. That will hurt the existing already struggling businesses in the urban corridor, but may be a boon to all the other locally owned shops and stores located away from the shopping centers, like in downtown Mill Valley. They can't do to downtown Mill Valley like what they did to San Rafael.

I do question the experimental Google computer driven cars though, they will only work in a very small part of Marin in the very distant future (if

## Plan Bay Area 2040 Final Environmental Impact Report

ever).

I don't think that cybercars will ever become reality for the masses. To me it's just a science fiction pipedream, just like some science fiction writers predicted that someday SmartMeters will control all devices, not going to happen.

Bob Silvestri

10:44 am on Tuesday, May 7, 2013

Good points, Richard. And the reality about greenhouse gas emissions (GHG) reduction claims for Plan Bay Area, noted in its Draft Environmental Impact Report (DEIR), is even worse than what you have noted.

The DEIR fails to acknowledge that in counties like Marin, Sonoma and Napa, almost 90 percent of the car and light truck use will not be effected by anything in the Plan (for a detailed explanation, please

see <http://millvalley.patch.com/articles/op-ed-the-truth-about-sb375-and-the-one-bay-area-plan>). So in Marin, those numbers are reduced by one decimal point, meaning they become -2.3%, -2.5% and -2.6%.

However, it gets worse. The data that the DEIR used was from an old study that ended in 2005. So the Plan's projections of GHGs after that date, which showed dramatic increases from cars, have already been proven false because GHGs from cars have been dropping since 2007. So their "savings" are compared against false assumptions about future GHG increases, not actual data.

Still worse, the DEIR by its own admission says that the data used to justify the benefits from the Plan (-23%, -25%, etc.) does not include the impacts of the newly passed CAFE standards of 54.5 mpg for all U.S. cars and light trucks. If you factor that in, or look at what the EPA says the impact of that will be going forward, the emissions reductions from cars and light trucks will be greater than the Plan projects even if we do nothing at all! The truth is that our GHG problems lie elsewhere.

Question. What is the true story behind 30 North San Pedro, a supposedly grand sample of transport aligned multi unit development? The 80 unit monster went bankrupt. Without a performance bond, the bankruptcy hurt many of the contractors who worked on it. Mechanics Liens don't really help contractors recover the full amount owed. (Though disgraced and bankrupt, the developer is now proposing yet another big box housing project in downtown San Rafael) The 80 unit complex passed without a traffic analysis, this thanks to San Rafael traffic engineer, Nader Mansourian who admitted in a public meeting that the oversight was intentional in order to advance the project along. If rented, you can be assured that the units will provide the current owners with high rental income. Is this the vision of "affordable" housing? High rent? Is it ethical to locate such housing next to a busy freeway? You'd think in "enlightened" Marin we'd know better. So who's agenda then really runs things?

33 North San Pedro... Luxury Apartments.

<http://www.33north.com/>

33 North San Pedro... of 82 units, 16 must be "affordable housing" (20%)

[http://www.marini.com/business/ci\\_20912160/san-rafael-condo-project-33-north-sold-units](http://www.marini.com/business/ci_20912160/san-rafael-condo-project-33-north-sold-units)

One Bay Area Plan, "By 2020" page 57

<http://www.onebayarea.org/regional-initiatives/plan-bay-area.html>

For Marin, the highest income level will get 40% more housing units than the lowest income level. (887 vs 617, round to 900 v 600 to easily see the numbers are close to 2:1)

Like "The Producers" many people are being sold the same "affordable housing" units. The poor, the working poor and the seniors.

Kevin Moore

1:32 pm on Wednesday, May 8, 2013

I left out the children who grew up in Marin, those who commute to Marin for work, people who never lived in Marin and want to live in Marin.

Dave Robertson

12:37 pm on Tuesday, May 7, 2013

Everyone talks about "balancing" Marin with the Bay Area. But Marin is different than the rest of the Bay Area - and that is a good thing. The east and south bays are overcrowded. Traffic is a mess. The peninsula isn't much better. Ever since Stanford (who owns a ton of land down there) decided to give up some land and develop it for the university and housing, the whole place has gotten really uncomfortable.

I can see wanting to live in the South Bay and Peninsula for the job opportunities and proximity to Stanford. They have more than their share of multi-billion dollar innovative corporations - and it shows. But Marin is not like that. We are small, still look like California (not suburban New Jersey!) and just don't see the draw making us into anything that is different. Why don't we leave Marin alone. If you want the overcrowded, high tech environment - move to Sunnyvale. All your neighbors can talk microchips and are packed in like sardines. And it is a very rare thing to get up to the 280 corridor - the only remaining part of that area.

To top that, Marin has less of a public infrastructure than all those areas. If the GG bridge went down in a quake, people would be swimming to work. Lets get real here!

Eleanor Sluis

7:19 pm on Tuesday, May 7, 2013

A tapeworm analogy.

It appears that Marin County supervisors and cities with the exception of Larkspur agree to accept the tapeworm transformation of tackling traffic by eating as many federal dollars as possible in order to tear at the rural body of Marin.

The antidote to this tapeworm eating rural air, land and water is to say that One Bay Area Alternative 1 (a no plan) is best for our body of Marin and Sonoma.

The other alternatives are similar to an unwanted technical tapeworm being mistaken as beneficial to residents and determining politically the health of our county and cities.

This proposal of a no plan as an alternative is an antidote to get rid of eating federal funds for useless bus stations in Novato and wasteful engineering of streets and highways.

Voting no rid this tapeworm Plan Bay Area from the local systems of healthy living. Plan Bay Area as a tapeworm is intent on destruction of a rural, workable, healthy, agricultural, watershed, and balanced equitable use of density and funds.

## Plan Bay Area 2040 Final Environmental Impact Report

Metropolitan areas of Richmond, San Jose, and Oakland need federal monies for educating their youth. Even Sonoma State needs more funding for classes for graduating seniors on time.

Our supervisors and cities can send a message to the One Bay Area commission saying no to this plan as an antidote to a telemarketing tapeworm of trauma to the bodies of Marin and Sonoma if they are aware of the consequences of this terrible plan.

Rico

They have more than their share of multi-billion dollar innovative corporations - and it shows. But Marin is not like that. We are small, still look like California (not suburban New Jersey!) and just don't see the draw making us into anything that is different. Why don't we leave Marin alone. If you want the overcrowded, high tech environment - move to Sunnyvale. All your neighbors can talk microchips and are packed in like sardines. And it is a very rare thing to get

## Plan Bay Area 2040 Final Environmental Impact Report

up to the 280 corridor - the only remaining part of that area.

To top that, Marin has less of a public infrastructure than all those areas. If the GG bridge went down in a quake, people would be swimming to work. Lets get real here!

Eleanor Sluis

7:19 pm on Tuesday, May 7, 2013

A tapeworm analogy.

It appears that Marin County supervisors and cities with the exception of Larkspur agree to accept the tapeworm transformation of tackling traffic by eating as many federal dollars as possible in order to tear at the rural body of Marin.

The antidote to this tapeworm eating rural air, land and water is to say that One Bay Area Alternative 1( a no plan) is best for our body of Marin and Sonoma.

The other alternatives are similar to an unwanted technical tapeworm being mistaken as beneficial to residents and determining politically the health of our county and cities.

This proposal of a no plan as an alternative is an antidote to get rid of eating federal funds for useless bus stations in Novato and wasteful engineering of streets and highways.

Voting no rids this tapeworm Plan Bay Area from the local systems of healthy living. Plan Bay Area as a tapeworm is intent on destruction of a rural, workable, healthy, agricultural, watershed, and balanced equitable use of density and funds.

Metropolitan areas of Richmond, San Jose, and Oakland need federal monies for educating their youth. Even Sonoma State needs more funding for classes for graduating seniors on time.

Our supervisors and cities can send a message to the One Bay Area commission saying no to this plan as an antidote to a telemarketing tapeworm of trauma to the bodies of Marin and Sonoma if they are aware of the consequences of this terrible plan.

Re: Public Comment on Draft Plan Bay  
Area and Draft Bay Area Plan Draft  
Environmental Impact Report

This letter is submitted as public comment  
on the Draft Plan Bay Area and Draft Bay  
Area Plan Draft Environmental Impact  
Report (State Clearinghouse No.  
2012062029).

The undersigned submitter of these public  
comments identifies himself as follows:  
1958 BME degree from Rensselaer  
Polytechnic Institute, 1962 LLB degree from  
George Washington University Law School,  
& retired member of the Virginia &  
Colorado Bar Associations & The United  
States Patent & Trademark Office  
(registration 19,711 dated 1962). Resident  
of Orinda, CA since the year 2000.  
Employment experience is as a patent and  
technology licensing attorney for 46 years,  
including for corporations & law firms in  
the fields of telephone, medical devices,  
mainframe computers, solid state devices,  
Java technology, fiber optic com-

Chester E. Martine, Jr., Public Comment on Draft Plan Bay Area  
and Environmental Impact Report Plan Bay Area Draft, page2

munications, aircraft navigation devices, semiconductor device manufacturing equipment, water purification equipment, & long-distance sensing of gases such as methane. Also taught physical science & physics at St. Paul's School for two years (1969-1971). Lastly, commuted by Prius car to & from Sunnyvale, CA for ten years working as a patent attorney. Retired in 2008, then for three years volunteered in two San Francisco Middle Schools, including mentoring 8<sup>th</sup> grade students in mock trials relating to Anthony Burns, a fugitive slave who was tried under the Fugitive Slave Act of 1850, & teaching small groups about the school desegregation cases: Brown vs. Board of Education. Interrupting such school volunteering, for the last two years have been a Trustee of a Trust for two settlors (deceased friends), including managing a Fremont, CA company owned by one of the deceased & selling its assets, managing medical care for one of the settlors, & distributing millions of dollars of Trust assets to nine beneficiaries. From the standpoints of legal, technical & complex document analysis, among other things, this legal education & work is pertinent to both the Draft Plan Bay Area and Draft Bay Area Plan Draft Environmental Impact Report, as well as to the hundreds of other documents that are cited in these Drafts or are attached as appendices.

**Comments on the Environmental Impact  
Report Plan Bay Area Draft (“DEIR”) of  
Draft Plan Bay Area (“DPBA”)**

C186-1

**Comment 1: This Comment identifies what CEQA Section 15126.6 (e) (2) defines, in terms of what the DEIR shall include for the No Project alternative 1 (referred to as “No Project”).**

**The required inclusions are an analysis that discusses:**

- (i) “existing conditions at the time the notice of preparation is published...”,**
- (ii) as well as: “what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infra-structure and community services”.**

**(see CEQA Section 15126.6 (e) (2) which is attached as Item 1-1 of Appendix I).**

**Fact 1-1: Considering the initial aspect of that analysis, CEQA Section 15126.6 (e) (2) first refers to the analysis that discusses:**

**“the existing conditions at the time the notice of preparation is published....”.**

**Fact 1-2:** The notice of preparation (“NOP”) was published on June 11, 2012.

(see NOP pages 1-4, 10, & 11 which are attached as Item 1-2 of Appendix I).

**Fact 1-3:** Because the notice of preparation was published on June 11, 2012, June 11, 2012 is the reference date for those regulations that exist and are to be implemented by the No Project alternative if the Plan Bay Area is not approved.

**Query 1-1:** Having the date of the notice of preparation, does the DEIR discuss any conditions that were existing as of June 11, 2012?

C186-2

**Fact 1-4:** At page 3.1-3, in a DEIR Section entitled “Approach to Assessing Alternatives”, a review of Mitigation Measures expressly states:

“The No Project alternative is assumed to implement existing regulations”.

(see DEIR pages 3.1-3 through 3.1-5 which are attached as Item 1-4 of Appendix I).

**Query 1-2:** Given this “assumption”, does the DEIR discuss what it means to “implement” regulations that were existing as of June 11, 2012?

**Fact 1-5:** At DEIR page 3.1-4, a Section is entitled “Alternatives Analyzed in this EIR” (see attached Item 1-4 of Appendix I). Under

the “Alternatives Analyzed in this EIR” heading,  
on page 3.1-5 in Item 1-4, another heading  
entitled:

**“ALTERNATIVE 1: NO PROJECT”**

identifies the No Project alternative as the first  
alternative analyzed.

**Query 1-3:** What does the DEIR say on pages 3.1-4  
and 3.1-5 about what it means to “implement”  
regulations that were existing as of June 11, 2012?

**Fact 1-6:** Under the above “ALTERNATIVE  
1: NO PROJECT” heading, that Section on DEIR  
page 3.1-5 starts with a statement of what is *not* to  
be done by the No Project. That starting statement  
does not discuss what it means to “implement”  
regulations that were existing as of June 11, 2012.  
Rather, with respect to an introduction stating:

**“The No Project alternative represents  
the potential scenario of Plan bay Area  
is not implemented”,**

**that starting statement says:**

**“...no new regional policies would be  
implemented...and no uncommitted  
transportation investments would be made”.**

C186-3

**Query 1-4: Does the DEIR say anything about what it means to “implement” regulations that were existing as of June 11, 2012?**

**Fact 1-7: Under that “ALTERNATIVE 1: NO PROJECT” heading, that same Section on DEIR page 3.1-5 continues by stating a new subheading entitled “Land Use Policies:”**

**The “Land Use Policies” section states:**

**“...Urban growth boundaries would be assumed to expand at historic rates, allowing for additional development potential in greenfield locations.”**

**Query 1-5: In this “Land Use Policies” section does the DEIR discuss why urban growth boundaries are assumed to expand at historic rates in the implementation of regulations that were existing as of June 11, 2012?**

**Fact 1-8: No, this “Land Use Policies” section does not discuss why urban growth boundaries are assumed to expand at historic rates in the implementation of regulations that were existing as of June 11, 2012.**

**Fact 1-9: Rather, this section states more of what is not to be done by the No Project in the future, namely:**

**“Land Use Policies: No new regional land use plan would be developed and no new policies would be implemented to influence the locations of housing and employment centers in the region. No new fees, subsidies, or land development incentives would be provided on the regional level.”**

**C186-4**

**Fact 1-10: Immediately after this next-above quoted text, the text refers to those “urban growth boundaries” made, which is not explained.**

**Query 1-6: Recognizing that the above assumption about urban growth boundaries expanding at historic rates is not explained or discussed, the question is:**

**other than the above introduction stating that the No Project alternative represents the potential scenario if Plan Bay Area is not implemented, does the DEIR include any discussion of what it means to “implement” regulations that were existing as of June 11, 2012?**

**Fact 1-11: None has been found. Rather, at pages 3.1-8 to 3.1-10 of the DEIR, Table 3.1-1 charts various policy measures of the various alternatives. Instead of such a discussion of the required “existing conditions”, that Table with this chart includes one-line items, such as “Existing General Plans” that are identified with the No Project. These one-line items omit a discussion of the required “existing conditions”.**

(see DEIR pages 3.1-8 to 3.1-10 attached as Item 1-11 of Appendix I).

**Fact 1-12:** The same omission of a discussion of existing regulations of the required “existing conditions” applies to Table 3.1-2 (page 3.1-11 of the DEIR), which only lists 2010 population & other 2010 data.

(see DEIR page 3.1-11 attached as Item 1- 11 of Appendix I).

**Query 1-7:** Apart from the DEIR, but relating directly to the DEIR, is there a reference to what it means to “implement” regulations that were existing as of June 11, 2012?

**Fact 1-13:** The Notice of Preparation for the DEIR includes a document called “Attachment A, Project Description & Scope Of Environmental Analysis”. (see pages 4, 10, & 11 of attachment A, which are attached as part of Item 1-12 of Appendix I)

**Fact 1-14:** At pages 10 & 11 of that Attachment A it is noted that “more precise definition of the alternatives, or new alternatives, will likely emerge as the EIR scoping and preparation process evolves”.

**Fact 1-15:** At page 11, Attachment A of the NOP states:

“For purposes of this EIR, the No Project alternative consists of two elements:

**(a) the existing land uses plus continuation of existing land use policy as defined in adopted general plans, zoning ordinances, etc. from all jurisdictions in the region and**

**(b) the existing 2010 transportation network plus a set of highway, transit, local roadway, bicycle and pedestrian projects that have either already received funding or are scheduled for funding and have received environmental clearance by May 1, 2011.”**

**C186-5**

**Query 1-8: Does the NOP describe or discuss the existing land uses or the continuation of existing land use policy as defined in adopted general plans, zoning ordinances, etc. from all jurisdictions in the region?**

**Fact 1-16: No such description or discussion has been found in Attachment A of the NOP.**

**C186-6**

**Query 1-9: Does the NOP describe or discuss which “existing land uses” or which continued “existing land use policy as defined in adopted general plans, zoning ordinances, etc. from all jurisdictions in the region” provide, or foster, the assumption noted above in Fact 1.7, that:**

**“...Urban growth boundaries would ...expand at historic rates, allowing for additional development potential in greenfield locations.”**

**Fact 1-17:** No such description or discussion has been found in Attachment A of the NOP.

C186-7

**Query 1-10:** Other than in the “ALTERNATIVE 1: NO PROJECT” section noted above in Facts 1-5 & 1-6, does the DEIR include any discussion of existing land use policy as defined in general plans, zoning ordinances from any jurisdictions in the region?

**Fact 1-18:** No such description or discussion has been found in the DEIR in terms of what it means to “implement” regulations that were existing as of June 11, 2012.

C186-8

**Query 1-11:** Does the DEIR refer to any regulation impacting existing land use policy as defined in general plans, zoning ordinances in any jurisdictions in the region, and if so, is that reference included in the subheading entitled “Land Use Policies:” under the description of the “ALTERNATIVE 1: NO PROJECT” heading?

**Fact 1-19:** Yes, the DEIR recognizes that the CA Clean Air Act existed as of June 11, 2012. However, that reference is not included in the subheading entitled “Land Use Policies:” under the description of the “ALTERNATIVE 1: NO PROJECT” heading. In detail, on page 2.2-1 the DEIR includes a main section “2.2” entitled “Air Quality”. In that main section, on page 2.2-12 under a heading entitled: “State Regulations”, the DEIR refers to that Clean Air Act. Also, the most recent update to that Clean Air Act is there called “*The Bay Area*

***2010 Clean Air Program***” (herein 2010 CAP). See Item 1-19 of Appendix I, which is DEIR pages 2.2-1 & 2.2-12. The context of this reference to 2010 CAP related to duties of nonattainment areas and local air districts under the 2010 CAP.

**Fact 1-20:** In terms of an “Impact” 2.2-1(a) described on DEIR page 2.2-27, the DEIR noted that the 2010 CAP:

“...recognizes the need to encourage future population and job growth in areas that are well served by transit and where mixed-use communities provide jobs, housing, and retail in close proximity.”

Also, the DEIR there stated that:

“Key themes embedded in the 2010 CAP include:

...

“Ensuring that focused growth in priority areas is planned and designed so as to protect people from both existing sources and new sources of emissions.”

(see Item I-20 of Appendix I, which is DEIR page 2.2-27).

**Query 1-12:** In that page 2.2-27 reference to 2010 CAP, did the DEIR note that any existing land use regulation or existing land use policy (e.g., as defined in general plans, zoning ordinances in any

jurisdictions in the region) was consistent with 2010 CAP?

**Fact 1-21:** No, there the DEIR only stated that:

**“Consistent with the 2010 CAP, the proposed Plan is based on the goals of ...focusing growth in areas that are well-served by transit and existing infrastructure.”**

C186-9

**Query 1-13:** As of June 11, 2012, other than 2012 CAP, were there any existing land use regulations or existing land use policies (e.g., as defined in general plans, zoning ordinances in any jurisdictions in the region, or any other land use regulations) having an effect on land use?

**Fact 1-22:** Yes, the State Housing Element Law (the SHEL) is a regulation existing as of June 11, 2012. This existing regulation is summarized in a document entitled “State Housing Element Law”, which is attached Item 1-22 of Appendix I. In essence, under SHEL each California city & county must adopt a General Plan (GP). A mandatory element of every GP is a housing element (HE). (see pages 1-3 of the SHEL attached as Item 1-22 of Appendix I)

**Query 1-14:** In re June 11, 2012, what is the effect of the State Housing Element Law existing as of June 11, 2012 on whether the DEIR must discuss the SHEL and the HE as part of the CEQA-required discussion of “the existing conditions at the time the

**notice of preparation was published” with respect to the No Project?**

**Fact 1-23: Because the existing SHEL is a regulation existing as of June 11, 2012, the DEIR must discuss the SHEL and the HE as part of the CEQA-required discussion of “the existing conditions at the time the notice of preparation was published” with respect to the No Project.**

**Query 1-15: Are there other parts of SHEL or the HE having a bearing on the CEQA-required discussion of “the existing conditions at the time the notice of preparation was published” with respect to the No Project?**

**Fact 1-24: Yes.**

**Fact 1-25: See page 1 of 2 of a document entitled “Final Regional Housing Need Allocation to be Released Summer 2013”, attached as Item 1-25 of Appendix I. In view of the mandate in the SHEL that cities must revise their respective HE’s every eight years, this SHEL regulation, and the resulting currently-effective Housing Elements mandated under SHEL, are part of the “existing conditions at the time the notice of preparation was published” and are part of the CEQA-required discussion of “the existing conditions at the time the notice of preparation was published” with respect to the No Project.**

C186-10

**Query 1-16:** Are there other regulations as of June 11, 2012, having a bearing on the CEQA-required discussion of “the existing conditions at the time the notice of preparation was published” with respect to the No Project?

**Fact 1-26:** Yes, the next Facts 1- 27 through 1-44 discuss other existing regulations related to No Project (which the DEIR assumes are to be implemented by No Project). This discussion sets forth results of years of implementing all such other existing regulations. These Facts 1-27 through 1-44 both:

(i) define “existing conditions at the time the environmental analysis is published...”, & assist in determining

(ii) assist in determining “what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure”.

**Fact 1-27:** The State Housing Element Law existing as of June 11, 2012, as summarized in that document entitled “State Housing Element Law” (see Item 1-22, Appendix I), refers to what each Council of Governments must do, which is to prepare a Regional Housing Need Plan (RHNP). The RHNP is to promote many objectives, including:

**“Increase the housing supply and the mix of housing types, tenure, and affordability in all cities...in an equitable manner”; & “Promote infill development and socioeconomic equity...”.**

C186-11

**Fact 1-28: As noted in Fact 1-19, the DEIR recognizes that the 2010 CAP:**

**“...recognizes the need to encourage future population and job growth in areas that are well served by transit and where mixed-use communities provide jobs, housing, and retail in close proximity.” .”**

**Fact 1-29: Referring to (DEIR page 3.1-3, Item 1-4 of Appendix I), the “Alternatives Analyzed in this EIR” section for the No Project alternative is the appropriate place for the CEQA discussion based on Section 15126.6 (e) (2). That section omitted those above details of the 2010 CAP. Thus, that section omitted the details above about the 2010 CAP recognizing:**

**“... the need to encourage future population and job growth in areas that are well served by transit and where mixed-use communities provide jobs, housing, and retail in close proximity.”**

C186-12

**Fact 1-30: An October 2002 Smart Growth Strategy is an “existing condition” as of June**

**11, 2012. This Strategy shows the 2010 CAP was preceded by one of numerous existing Bay Area regulations that encourage future population and job growth in areas that are well-served by and were in close proximity to Transit. The movement toward such regulations started by ABAG as early as October 2002 with the Smart Growth Strategy which may be found at:**

**[www.abag.ca.gov/planning/smartgrowth/Publications/Final%20Report](http://www.abag.ca.gov/planning/smartgrowth/Publications/Final%20Report)**

**herein referred to as “SG2002”.**

**See SG2002 pages 2, 5, 6, 14-18, & 20-31 of Item 1-30 of Appendix I.**

**Fact 1-31: SG2002 included a section entitled “Creating Vision”, & at pages 2, 5, 6, 14-18, & 20-31 this SG2002 Report referred to actions in late 1999 by five Bay Area agencies (including ABAG & MTC) which initiated discussion of smart growth in the region. Discussions over the next two years resulted in “The Smart Growth Alternatives” shown on page 5, which were described as follows:**

**“Each of these three alternatives represented a departure from the ‘current trends base case’, a term coined to describe the region’s future growth if nothing is done to chart a new course. The base case fails to provide sufficient housing for an increased population and workforce, resulting in continued rapid growth**

**in outlying areas, increased long-distance commuting and further environmental degradation. It envisions development focused in edge communities, with residential areas largely segregated from other uses and continued reliance on the automobile as the primary mode of travel.”**

**Fact 1-32: Page 6 of this section of SG2002 notes a Spring 2002 Alternatives Report that describes the three smart growth strategies. Under a heading “NEXT STEPS”, these were said to be set to be considered, and if adopted by the ABAG Executive Board would be the backbone of the MTC 2004 Regional Transportation Plan.**

**[note: printed PDF omitted some words]**

**Fact 1-33: In SG2002, pages 14-18 of a “Making Vision Reality” section of SG2002 descri**

**be an extensive set of “Incentives and Regulatory Change”, proposed to “change the ‘carrot and sticks’ that shape land use decisions by localities, neighborhoods and private developers”. At page 18, a chart Entitled “Innovative Bay Area Affordable Housing Programs” states:**

**“Already, Bay Area communities have created programs to spur affordable housing development. Here are some examples:”.**

**Page 18 of the “Making Vision Reality” section describes eight such existing programs.**

**Fact 1-34:** SG2002 pages 20-31 are of a section entitled: “The Vision Up Close: An Analysis of One Smart Growth Scenario”. This section describes contrasts between the adverse “base case” noted above and the favorable aspects of a specific smart growth land-use scenario developed in workshops in 2001 and 2002.

**Fact 1-35:** The “Vision Up Close...” section describes many adverse results of the “current trends base case”, which was current in 2002, eleven years ago, not on June 11, 2012. SB2002 relates to a discussion of existing conditions as of June 11, 2012. As one example, such discussion of SB2002 would inform the details of conditions leading to the PDAs described at DEIR page D-4 of Appendix D, “Scoping Comments on Alternatives”, Topic “Role of PDAs” (see page D-4 of Item 1-35 of Appendix 1). There, the “Response” indicates that the No Project “...is based on currently adopted general plans...”. Also, the Response refers to PDAs that are *de facto* In No Project. The discussions on SB2002 pages 20-31 include further details leading to the events of 2007 noted in Fact 1-36.

**Fact 1-36:** Five years after SG2002, the proposed Plan Bay Area had still not been published for public comment. Adoption of Plan Bay Area was left to the future, as the proposed Plan Bay Area PBA was not so published until March 28, 2013. In the absence of such publication, in 2007 ABAG published a

report entitled “A Place To Call Home: Housing in the San Francisco Bay Area” (herein called “AP2007”, see Item 1-36 in Appendix I, which includes pages “cover”, Table of Contents page 1, & pages 3, 8 through 28, & 34. At pages 15 to 28, AP2007 describes some significant events that occurred in the five years after the “current trends base case” was described in SG2002.

C186-13

**Fact 1-37:** In view of AP2007, without the Plan Bay Area that was not published for review until 2013, and by implementing the regulations that were effective from 2002 to 2007, the Bay Area region has made that 2002 “current trends base case” obsolete. This is shown by AP2007 at page 15, where it is noted that:

“...many local governments throughout the region are already finding solutions and achieving success. Some of the strategies they have used to expand housing choices in their communities are outlined in the following sections”.

**Fact 1-38:** These solutions and successes include a long list of events, which are identified in AP2007 at pages 8-12 (re RHNA). Also subregions are noted at page 12, & it is noted that local governments have specifically identified where growth can best be accommodated (page 13).

**Fact 1-39:** Also, twenty-one housing projects are shown on AP2007 pages 13-26. The apparent completion of these projects indicates success of these events that took place six years before Plan Bay Area was published for comment. Samples of that success are shown in Appendix A of AP2007, see reports on Bay Area RHNA Performance, 1999-2006. Appendix A shows apparent averages of permits issued vs. the RHNA allocation for new Bay Area housing for various low income levels.

(see Item 1-39 of Appendix I)

**Fact 1-40:** The totality of the permitting activity shown by AP2007 Appendix A with respect to all nine Bay Area counties is a clear indication of action implementing regulations that existed over the period of about 2002 to 2007, all in the absence of the proposed Plan Bay Area. Much of this activity stands completed as of June 11, 2012, and as such informs what are the “existing conditions” mandated by CEQA Section 15126.6 (e) (2) to be discussed in respect to No Project. Such activity includes confirmation that the Bay Area communities have created programs to spur affordable housing development, and all seem to have been opposite to the early and obsolete “current trends base case”.

**Query 1-17:** What evidence is there that there was a continuation past 2007 of that action implementing regulations that existed over the period of about 2002 to 2007, all in the absence of the proposed Plan Bay Area?

**Fact 1-41:** Such evidence is that the above history of focused housing growth extended forward to at least June 11, 2012. Such focused growth has been based on regulations existing over the period of about 2002 to 2010 (all without the proposed Plan Bay Area). To show such evidence, reference is made to a Final Report published March 29, 2013 by Economic & Planning Systems, Inc., & entitled “PDA Readiness Assessment (herein called “RA2013”). See RA2013 which is Item 1-41 of Appendix I for pages 1-43 and Figure 3 (pages 1-4) of Appendix A to RA2013).

C186-14

**Fact 1-42:** RA2013 is an independent indication of further events in the Bay Area after 2007 & up to the time at which the proposed Plan Bay Area was published for comment. By “independent” it is meant that the contributors to the Report, Economic & Planning Systems, Inc. (“EPS”) & its sub-contractor Community Design + Architecture (“CD+A”), were not only independent of ABAG & MTC who asked for the Report, but independent of the undersigned.

**Fact 1-43:** The stated purpose of RA2013 is (page 1) to:

**“...provide a deeper understanding and independent assessment of the readiness and feasibility of PDAs to accommodate the number of housing units envisioned by Plan Bay Area.”**

**The statement that RA2013 was needed to provide a deeper understanding and independent assessment of the readiness and feasibility of PDAs reflects not only on the vast number of pages of the Plan Bay Area & the DEIR, but on the apparent fact that a deep understanding of these two documents is not readily obtained only from reading those documents.**

**Fact 1-44: It appears that RA2013 is one of the few reports that independently assesses the additional regulations enacted since 2007, including local housing elements and zoning laws, for example. In this regard, RA2013 provides an independent definitive update to 2012 of the existing regulations that the DEIR says No Project is assumed to implement.**

**Fact 1-45: The reported results of RA2013 are consistent with the showings in AP2007 (e.g., on AP2007 pages 13-26, Item 39, Appendix I) indicating success of the enumerated events that took place many years before Plan Bay Area was published for comment.**

**Fact 1-46: RA2013, taken alone, and AP2007 taken alone, & RA2013 and AP2007 taken together, provide evidence of what should be a proper base point for defining what No Project is. For example, the successes identified by RA2013 (on pages 19 through 27) are clear, indicating that EPS estimated an average “base” readiness of 62% for twenty sampled PDAs.**

**Each of AP2007 & RA2012 separately, and both taken together, indicate that existing regulations, housing elements, zoning, etc., existing in the time frame either up to or close to June 11, 2012, have had a substantial degree of success. EPS estimated such success to continue to 62% of those goals without the proposed Plan Bay Area. In terms of the ongoing RHNAs, this success means to:**

**“Increase the housing supply and the mix of housing types, tenure, and affordability in all cities...in an equitable manner”; &  
“Promote infill development and socioeconomic equity...”.**

**RA2013 appears to be the most recent evidence of readiness events of Bay Area development projects. These events took place during the years before, and up to the date on which the proposed Plan Bay Area was published for comment. Also, the depictions and descriptions of the resulting new housing results show a wide range of housing types & affordability in infill development.**

C186-15

**Comment 2: This Comment cites Facts from Comment 1 and asserts that the DEIR inconsistently defines the No Project alternative. The DEIR does this by:**

**(1) defining the No Project in terms of urban growth boundaries assumed to expand at historic rates,**

**(2) and at the same time:**

**expressly stating that The No Project alternative is “assumed to implement existing regulations”.**

C186-16

**Query 2-1: How is the discussion of Facts 1-35 through 1-46 related to Fact 1-7 in which the “ALTERNATIVE 1: NO PROJECT” heading, and new subheading entitled “Land Use Policies:” stated:**

**“...Urban growth boundaries would be assumed to expand at historic rates, allowing for additional development potential in greenfield locations.”?**

**Fact 2-47: Such discussion is directly related to Fact 1-7 because such Facts 1-35 to 1-46 show that the DEIR is the DEIR is inconsistently defining the No Project alternative.**

- (1) defining the No Project in terms of such urban growth boundaries assumed to expand at historic rates (Fact 1-7), and at the same time:**
- (2) expressly stating as in Fact 1-4 (page 3.1-3, in DEIR Section “Approach to Assessing Alternatives”, “Mitigation Measures”) that:**

**“The No Project alternative is assumed to implement existing regulations”,**

**Assertion 2-1: The inconsistency is this. Facts 1-35 to 1-46 show that the existing regulations (e.g., RHNA, 2002 CAP & AP2007) promote implementing the RHNA allocations. The ways of promotion include local identification of PDAs, and other measures to facilitate “infill development” (AP2007 page 14). That facilitation of infill development is the opposite of the urban growth boundaries assumed to expand at historic rates, which is central to No Project (Fact 1-7) as indicated. By no reference in Fact 1-7 to the evidence in Facts 1-35 to 1-46.**

**Certainly, in the No Project case, the same existing regulations as are identified in Facts 1-35 to 1-44 will not both encourage urban growth boundaries expanding at historic rates and facilitate infill development at transit sites by way of multi-use development for a range of income levels. The main regional regulation (e.g., RHNA) has a focus on facilitating infill development at transit sites by way of multi-use development with housing for a range**

of income levels (see AP2007, page 15, as to local efforts to promote housing) The local zoning noted on pages 15 & 16 of AP2007 is to a significant degree responsive to RHNA, for example. This is evidenced by the readiness assessments in RA2013.

The DEIR simply fails to discuss this inconsistency, does not discuss what % of growth is to be of the urban type (with urban growth boundaries expanding at historic rates), and does not even mention the infill-type of growth in the definition of No Project in Fact 1-4.

CEQA Section 15126.6 (e) (2) requires analysis that discusses “existing conditions at the time environmental analysis is published”. It is submitted that the DEIR does not meet this CEQA requirement in that the statements in Fact 1-7 do not rise to the required level of “analysis” because they:

- (1) Only state one aspect of the No Project alternative (an assumption of urban growth boundaries expanding at historic rates).
- (2) Do not recognize, analyze or discuss the ongoing other type infill development at transit sites by way of multi-use development with housing for a range of income levels, as induced by the main existing regional regulation ( RHNA).
- (3) Do not recognize the extensive existing

**array of local housing elements and zoning laws which were assessed in RA2013, for example.**

**Therefore, the DEIR does not comply with CEQA and must be amended to overcome this deficiency, which is respectfully requested according to the terms of Request 2-1:**

**C186-17**

**Request R2-1 For Editing of The DEIR: It is requested that the DEIR be amended at page 3.1-5 to change the section entitled “ALTERNATIVE 1: NO PROJECT” to read as follows:**

**“ALTERNATIVE 1: NO PROJECT:**

**The No Project alternative represents the potential scenario if Plan Bay Area is not implemented. Given the above assumption in “MITIGATION MEASURES” that the No Project will implement existing regulations, land use policies, transportation investments & transportation policies will implement such regulations as the following:**

**2010 CAP, the Transportation 2035 Plan (adopted in 2009), and regulations requiring each jurisdiction to plan for housing at all income levels (see California Housing Element Law, Article 10.6), & the Regional Housing Need Allocation (RHNA), which is the state-mandated process to identify the share of the state’s housing need for which each jurisdiction must plan over an eight year period.**

**With such implemented regulations, under this No Project alternative, no new regional policies will be required in order to influence local land use patterns and no uncommitted transportation investments would be made.**

**The key elements of the No Project alternative that vary from the proposed Plan include the following:**

**\* Land Use Policies: Without One Bay Area Government (OBAG) funding, land use plans and policies based on the implemented existing regulations would influence the locations of housing and employment centers in the region. Such influence would include promoting land use patterns, policies, and infrastructure investments that support mixed-use, residential, transit-oriented development that reduce motor vehicle dependence and facilitate walking, bicycling and transit use. Such land use plans would include currently adopted general plans of Bay Area jurisdictions reflecting the local government's plan to see growth in a PDA once the zoning by such government permits such PDAs. Such land use plans would also include newly- adopted general plans of Bay Area jurisdictions reflecting the local government's plan to see growth in mixed-use, residential, transit-oriented development that reduce motor vehicle dependence and facilitate walking, bicycling and transit use, whether prompted by 2010 CAP or in response to market demand or factors other than the Plan. No new fees, subsidies, or land development incentives would be provided on the regional level.**

29

**\*Transportation Investments: Included in this alternate are:**

- \*\* the Transportation 2035 Plan that was adopted in 2009,**
- \*\* the Control Measures under 2010 CAP, e.g., TCM D-3 & Express Lanes (TCM B-3).**
- \*\* projects and programs that are identified as “committed” in MTC Resolution 4006 Committed Projects and Programs Policy (these committed projects and programs include transportation projects/programs that were sufficiently through the environmental review process as of June 11, 2012 and had full funding in place, with regional programs with executed contracts or funding already secured being considered committed), &**
- \*\* other specific projects identified in 2010 CAP Control measures Table 2-1.**

**\*Transportation Policies: Included in this alternate are:**

- \*\* 2010 CAP would also guide tolls, Parking prices, and localized parking minimums. For example, the 2010 CAP includes PCM # TCM B-3 as the “Bay Area Express Lane Network”, which will “Introduce roadway pricing on Bay Area highways through the implementation of an express lane network, also known as a High Occupancy Toll (HOT) lane network.” ” (end of requested edit)**

**C186-18**

**Comment 3:** This Comment cites Facts relating to the series of Tables starting at pages 3.1-8 to 3.1-10 of the DEIR (see attached Item 3-1 of Appendix I), and asserts that these tables do not overcome the deficiencies of the DEIR asserted in Comment 2.

**Fact 3-1:** At pages 3.1-8 to 3.1-10 of the DEIR (see attached Item 3-1 of Appendix I), Table 3.1-1 compares land use policies, transportation investments, and transportation policies of the various alternatives. Instead of a discussion of the required “existing conditions”, the chart of Table 3.1-1 has one line references to such items as “Existing General Plans” (page 3.1-8), and omits a discussion of the required “existing conditions”.

**Assertion 3-1:** In view of Assertion 2-1 above, the above reference in Table 3.1-1 to “Existing General Plans” does not meet the requirements of CEQA, and must be amended to overcome this deficiency, which is respectfully requested.

**C186-19**

**Fact 3-2:** Forecasts of the future start with Table 3.1-2 (page 3.1-11 of the DEIR, see Item 3-2 in Appendix I), which forecasts are compared to 2010 population data. There is no discussion of the required “existing conditions” of the No Project. The forecasts of No Project are based on the Fact 1-7 stated assumption.

**Assertion 3-2:** In view of the assertion in Comment 2-1, Table 3.1-2 does not meet the requirements of CEQA, and must be amended to overcome this deficiency, which is respectfully requested.

**C186-20**

**Fact 3-3:** The reference on DEIR page 3.1-16 to transportation in regard to existing conditions relates only to committed transportation projects, not to existing regulations of the required “existing conditions”. Moreover, reference is made to the existing condition in the form of regulation 2010 CAP, which includes 2010 CAP page 2-7 in re Control Measure TCM B-3. TCM B-3 shows that the reference on DEIR page 3.1-16 to No Project not having Regional Express Lanes is simply incorrect. (see Item 3-3 in Appendix III)

**Request 3-1:** In view of Fact 3-3, amendment to DEIR page 3.1-16 is requested to correct the statement in re “Alternate 1 – No Project. As corrected, consistent with 2010 CAP, this entry should state No Project having a Regional Express Lane.

**C186-21**

**Fact 3-4:** In re Item 1-20 of Appendix I, on DEIR page 2.2-27 the DEIR acknowledges that the 2010 CAP:

“...recognizes the need to encourage future population and job growth in areas that are well served by transit and where mixed-

**use communities provide jobs, housing, and  
retail in close proximity.”**

**Consistent with this recognition, 2010 CAP includes  
Table 2-1, entitled “BAAQMD 2010 Clean Air Plan  
Control Measures” (“PCM”). Please see exemplary  
Control Measures of 2010 CAP on pages 2-7, 2-8, 2-  
19 & 2-20, attached as Items 3-4 in Appendix III.**

**C186-22**

**Fact 3-5: Control Measure # TCM D-3 is named  
“Support Local Land Use Strategies” and is  
described as:**

**“Promote land use patterns, policies, and  
infrastructure investments that support mixed-use,  
transit-oriented development that reduce motor  
vehicle dependence and facilitate walking, bicycling  
and transit use.”**

**Assertion 3-3: It is submitted that Control  
Measure # TCM D-3 directed to encouraging  
essentially the opposite development as the DEIR  
attributes to No Project in Fact 1-7, , namely  
opposite to:**

**“Urban growth boundaries would  
be assumed to expand at historic rates,  
allowing for additional development  
potential in greenfield locations.”**

**C186-23**

**Request 3-2: In view of Fact 3-5 and Fact 1-7,  
amendment to DEIR page 3.1-16, first bullet,**

is requested to reduce the number of new acres of urbanized land according a new run of the applicable Model, in which the new run includes a factor appropriate for the amount of infill housing to result from implementing such existing regulations as RHNA, 2010CAP, as noted above for example in Facts 1-35 to 1-46.

C186-24

**Request 3-3:** Further in view of Facts 1-35 to 1-46 supporting the No Project alternative implementing existing regulations such as are identified in Facts 1-35 to 1-46, it is requested that the remainder of the Tables in the comparative part of the DEIR be amended with respect to the No Project to reflect the quantitative factors by which there will be a reduction in the acres of new assumed urban growth boundaries expanding from historic rates and an increase in the density of infill development at transit sites by way of multi-use development for a range of income levels. These amendments should properly reflect the impact of main existing regional regulations (e.g., RHNA) having a focus on facilitating infill development at transit sites by way of multi-use development with housing for a range of income levels (see Item 1-36 of Appendix I, AP2007, page 15, as to local efforts to promote housing, and local zoning noted on pages 15 & 16 of AP2007 which is to a significant degree responsive to RHNA, for example).

Such amendments should be consistent with the CEQA second requirement: (ii) “what would be reasonably expected to occur in the foreseeable

future if the project were not approved, based on current plans and consistent with available infrastructure”.

**Fact 3-6:** Further supporting Request 3-3, in view of all of the facts in Facts 1-35 to 1-46 above, & the above requirement that each Council of Governments must, on an ongoing basis, prepare Regional Housing Need Allocations, those RHNA would be reasonably expected to occur in the foreseeable future if the Plan Bay Area were not approved. Therefore, if the Plan Bay Area were not approved it would be reasonably expected that in the foreseeable future beyond June 11, 2012 RHNA would continue to be prepared, and that in such foreseeable future the objects of each RHNA would promote the above many objectives of increasing the housing supply and the mix of housing types, tenure, and affordability in all cities in an equitable manner, & would promote infill development and socioeconomic equity. This in turn would reduce the acres of new assumed urban growth boundaries expanding from historic rates, Further supporting Request 3-3.

**Fact 3-7:** Further supporting Request 3-3, in a Special Meeting of the Orinda, CA City Council on May 13, 2013 the Planning Director acknowledged that the City’s Housing Element was non-compliant. Notwithstanding such non-compliance, it was also noted that Orinda had made significant strides toward meeting its goals for more affordable housing in places near the Orinda BART station.

Examples were a Senior Housing complex under construction with 67 low income units, & eight moderate income units in a large single-family housing project (Orinda Grove), all done under the present Housing Element that responded to RHNA allocations for a mix of housing incomes and types. (minutes of meeting not yet available). Such development consistent with many goals of RHNA, for example, in turn would reduce the acres of new urban growth boundaries expanding from historic rates, which expansion is assumed in Fact 1-7. This discussion of the complex and housing project did not identify any non-existing infrastructure or community services that were required to complete these programs.

**Fact 3-8:** Further supporting Request 3-3, the requested amendment must explain how the history of SB2002 is a strong indicator of “what would be reasonably expected to occur in the foreseeable future if the...” Plan Bay Area were not approved, which would be that in the absence of the Plan efforts including SB2002 have over time lead to the PDAs noted in the Responses in the DEIR Appendix D: “Scoping Comments Received on Alternatives”, page D-4, Topic “Role of PDAs”. The Response to this Topic stated that some PDAs will *de facto* be in No Project, which PDAs in and of themselves reduce expansion of urban growth boundaries relative to historic rates, minimizing additional development potential in greenfield locations.

Metropolitan Transportation Commission  
Plan Bay Area Public Comment  
101 Eighth Street  
Oakland, CA 94607

*re: Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report*

Dear Metropolitan Transportation Commission,

This letter is submitted as public comment on the Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report (State Clearinghouse No. 2012062029).

I am a lifelong resident of the Bay Area, and have deep roots in California, the Bay Area, and my local community. I was born at the Stanford Hospital in Palo Alto, and have lived in and around the Menlo Park area virtually all my life. I am a graduate of local public schools, and have an undergraduate degree from Brown University in Providence, Rhode Island, an MBA from the University of California at Berkeley, and a law degree, summa cum laude, from Hastings College of the Law in San Francisco.

I am currently the Director of Bay Area Citizens, serving in a voluntary capacity. Bay Area Citizens is a nonprofit corporation that supports and protects the interests of the citizens of California in matters including land use regulation, property rights, local community control, and the environment.

Some of my most important early childhood memories are of my parents' activism in the civil rights movement in the Bay Area and nationally in the early 1960s, and I am deeply committed to a community that provides

MAY 16 2:26 PM

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

justice for all, rather than favoring a few. I am also deeply committed to preserving and protecting our natural ecosystem. And, last, I believe in preserving and protecting a healthy, vital human ecosystem that protects our fundamental liberties and enables individuals to flourish in organically organized and naturally developing communities.

Based on the above, I am profoundly opposed to central planning that dramatically impairs individual citizens' rights to live where and how they wish and dramatically undermines local decision making on how a city will grow and change. I am similarly opposed to governmental or social structures that serve powerful political and financial interests alone rather than those of the citizens themselves.

I also have a deep and abiding personal faith, and am an ordained deacon and elder in my local church, Menlo Park Presbyterian Church.

All of the above have informed my comments on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Report (EIR) that follow below.

**C187-1** It is my considered opinion that (1) the comment period allowed has been inadequate, and must be extended, and that (2) Plan Bay Area, at its core, is based on models, assumptions, forecasts, and omissions that are gravely deficient and intellectually dishonest.

## **I. Plan Bay Area's inadequate process**

**C187-2** My colleagues and I have faced significant obstacles in securing public records from MTC that were necessary to understand the analysis that underlies the draft Plan and its draft EIR. Hence, I hereby request a 30-day extension of the deadline for submission of comments, until June 15, 2013 or from the date the extension is granted, if the extension is granted after May 16, 2013. The information we requested of MTC on March 13, 2013 and did not receive access to until April 19, 2013, should have been publicly accessible all along—let alone made available in a timely fashion in response to a Public Records Act Request—as this information was essential for the public to understand MTC and ABAG's analysis of the draft Plan and draft EIR and thus to be able to submit informed comments.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

In addition, I endorse those requests by citizens and cities that are requesting an overall suspension of the process and that no vote on the Plan occur for at least six months, so that adequate, informed public debate on the Plan can take place. Further, this Plan must not move forward until the substantive, and material concerns that citizens have raised about the Plan, the draft EIR, and the process, have been addressed.

#### **A. March 13, 2013 California Public Records Act request**

C187-3

In early March of 2013, my colleagues and I realized we needed to have information about MTC's models in order to understand the analysis that MTC and ABAG performed in evaluating the alternatives in the draft EIR, as this information had not been made publicly accessible by MTC. We also understood that the modeling information should be easily and quickly available by filing a California Public Records Act request with MTC.

I considered filing a Public Records Act request with MTC as an individual citizen, similar to the way I had filed requests recently with several cities and the state Department of Housing and Community Development<sup>1</sup> for public records regarding Regional Housing Needs Assessments (RHNA). Pursuant to those requests, I had almost invariably received those records in a timely fashion from those agencies.

However, I had had conversations with citizens who had filed Public Records Act requests in late 2012 and early 2013 with MTC and ABAG, and their requests had faced extraordinary levels of stonewalling and obstruction. I had reviewed the correspondence between MTC and ABAG and these citizens. MTC and ABAG could never seem to understand the plain language of these requests<sup>2</sup> and it was months before any records were furnished--and it was breathtaking for me to read statements in emails from ABAG or MTC that were express violations of the law. Consider the following exchange between a citizen and ABAG, where ABAG asserted

<sup>1</sup> Please see Appendix A for examples of those Public Records Act requests that I filed with other public agencies at about the same time.

<sup>2</sup> Because of this, we specified in careful detail the records we were looking for in our March 13, 2013 Public Records Act request, having become aware of the seemingly calculated ability of ABAG and MTC to repeatedly fail to understand the plain language of Public Records Act requests from individual citizens.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

that it had a right (not permitted to it by the California Public Records Act) to charge the citizen for searching ABAG's files for records responsive to the citizen's request:

On January 24, 2013, the citizen had sent an email to ABAG requesting:

pursuant to the California Public Records Act, all documents, including but not limited to all emails, memorandum, reports, correspondence, meeting agenda and minutes, etc, related to any of the following:

Bay Area Alliance for Sustainable Communities (or any known or reasonable variant of that name)  
Compact for a Sustainable Bay Area

Then the citizen received a reply from Joanna Bullock of ABAG on January 28, 2013 that stated:

A search for the documents you request that refer to . . . the Bay Area Alliance . . . during the time period 1995 through 2000 would amount to a significant cost that would be charged to you.

Faced with this evidence of consistent obstruction and months of delays to requests submitted by individual citizens, my colleagues and I asked Judicial Watch to file our Public Records Act request with MTC for data related to its modeling analyzing the Plan and the draft EIR. We surmised that receiving a Public Records Act request from a respected national public interest law firm that specializes in these sorts of requests would more likely get a response from MTC than an individual citizen would, and we turned out to be right in that.

However, we weren't prepared for nor did we expect the level of obstruction that even a request from Judicial Watch received. Our request for modeling data filed March 13, 2013,<sup>3</sup> was responded to by MTC at the last possible day on March 25, 2013,<sup>4</sup> saying that the agency needed additional time.

---

<sup>3</sup> Appendix B.

<sup>4</sup> Appendix C.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

MTC waited until the maximum allowable 14 days until April 8, 2013,<sup>5</sup> before responding to say they had identified responsive records. Even then it took an additional 11 days, until April 19, 2013, before MTC made those records available to us.

## **B. First access to records, April 19, 2013**

On the morning of April 19, 2013, my colleague Tom Rubin and I requested the assistance of two additional people, one an MBA with a corporate planning background, and the other a retired attorney—both intimately familiar with Plan Bay Area and able to help us review what we expected to be boxes of records made available to us in response to our request. We expected boxes of records because of the week after week in delays in making these records available to us.

What we weren't prepared for was what we were presented with when we arrived at MTC's offices at 9:00am in the morning on Friday, April 19, 2013. The four of us were ushered into a conference room, where we were presented with a single laptop computer. The records included several hundred documents contained in about 30 folders and subfolders on the laptop. All were records that were retained by MTC in electronic form.

In addition, MTC told us that morning, in direct violation of the express terms of the Public Records Act,<sup>6</sup> that we would be required to pay \$0.25 per electronic page for each record we wanted electronic copies of. Since there were thousands of pages in the electronic documents we were granted access to, the total cost to us would have been in the thousands of dollars. And one of the most important sets of data we were looking for, the spreadsheets, would only be provided to us in .pdf format—a format that wouldn't let us see the formulas in the spreadsheet cells, and wouldn't let us evaluate the analysis performed by MTC and ABAG.

---

<sup>5</sup> Appendix D.

<sup>6</sup> These were records retained by MTC in electronic form. A public agency is not permitted to charge a per page fee for each electronic page of document it retains in electronic form. It is only permitted to charge a fee for the direct costs of copying the electronic record to electronic media. Government Code §6253(b). For electronic documents, this would generally be a nominal fee as most if not all of that fee would be for the media itself (e.g., the CD).

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

Needless to say, we were stunned and deeply troubled at this further evidence of obstruction of our Public Records Act request. We called the attorney that we had been working with at Judicial Watch, Julie Axelrod. Ms. Axelrod shared with Ms. Pam Grove, MTC's Public Information Officer, that we considered MTC's response to be deficient and in direct violation of the law.

I shared with Ms. Grove our grave concerns over the repeated pattern of obstruction. We had requested the records on March 13, 2013, and were entitled to them within 10 days, or by March 23, 2013. This would have been in time for us to review them at the March 22, 2013 beginning of the 55 day comment period allowed for Plan Bay Area, and before the April 2, 2013 beginning of the 45 day comment period allowed for the draft Plan Bay Area. Yet it was now April 19, 2013--five full weeks after our March 13, 2013 Public Records Act request, a full month into the eight week comment period for the Plan itself, and two and a half weeks into the six and a half week comment period for the draft EIR. And here we were faced here with further unreasonable and unnecessary obstruction.

I also shared with Ms. Grove what she assuredly knew, that MTC's obstruction of our request was preventing us from being able to understand the analysis MTC and ABAG had performed on the Plan and the draft EIR, and was preventing us from being able to submit informed comments on the Plan and draft EIR. Finally, I shared with Ms. Grove (and did so courteously and respectfully), that at this point, MTC's obstructing our ability to comment on the Plan and the draft EIR was becoming MTC's problem, and not ours.

To MTC's credit, and to Ms. Grove's, after being presented with our objections to MTC's continuing pattern of obstruction, MTC relented and provided us with the records on a CD, charging us the statutorily allowed amount of \$8.60 for copying electronic records to electronic media—what they should have done in the first place, and should have done weeks before.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

### C. Request for Extension

C187-4

We lost an unrecoverable four weeks in our ability to understand MTC and ABAG's analysis of the draft Plan and draft EIR and thus to our ability to submit informed comments on the draft Plan and draft EIR, due solely to MTC's obstruction of our request. Hence, as mentioned above, we hereby request an additional 30 days to file comments on the draft Plan and draft EIR, either until June 15, 2013 if the request is granted immediately, or for 30 days after the request is granted. We also hereby state that we consider the comment period, if it is not extended for an additional 30 days, to have been inadequate as a matter of law.

### D. The Two MTCs – the First Responsive, the Other Obstructive

C187-5

What's deeply ironic about MTC's pattern of stonewalling and obstruction is as we faced week after week of delay and obstruction, trying to review the documents that were provided on Plan Bay Area's website without essential information on MTC and ABAG's analysis and models, we learned that MTC and ABAG were passing out their entire software models themselves, together with additional model related data, immediately upon request to organizations that were closely aligned with MTC and ABAG. That is, insider, "stakeholder" organizations only needed to request the models themselves, and to those insider organizations, MTC and ABAG were passing out their software models and associated data like Halloween candy.

So, based on the information we learned from one of these organizations that had so easily secured MTC and ABAG's models and associated data, we contacted MTC's chief modeler notifying him we'd heard that the models and associated data were being made available to requesting organizations, and asked for the data.<sup>7</sup> Within a few days, MTC and ABAG's modeling professionals provided me with ABAG and MTC's software models and associated data on a 1 terabyte hard drive that I had dropped off at their offices.<sup>8</sup> What a stunning contrast in response to our request. At exactly at the same time, MTC and ABAG's modeling professionals were offering us

<sup>7</sup> Email correspondence attached as Appendix E.

<sup>8</sup> Id.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

timely access to the modeling data in their possession when we approached them through the referral of an organization that is closely aligned with MTC and ABAG,<sup>9</sup> while MTC's executives and lawyers were continuing their week after week obstruction of our simple request for similar and related data when they considered us a citizen or an organization that was not closely aligned with them.

### **E. Violation of the RTAC Report Mandates**

MTC's consistent pattern of obstruction was, and remains, deeply troubling to us because we were aware then, and aware now, that not only is the modeling data absolutely essential for the public to have an understanding of the analysis performed by MTC and ABAG of Plan Bay Area and its draft EIR, and essential to the public's ability to submit informed comments on both, but the state of California has issued strict guidelines mandating full access to and disclosure of modeling data used to analyze a sustainable communities strategy like Plan Bay Area, through the California Air Resource's Board's Regional Targets Advisory Board (RTAC). The formation of the RTAC was mandated in SB 375 itself, Government Code § 65080 (b)(2)(A)(i),<sup>10</sup> and the RTAC's final report discusses the importance

---

<sup>9</sup> We have great respect for Mr. Ory and his courtesy and his helpful responses to questions that we had about MTC's modeling efforts, and we don't mean to suggest that his actions with respect to our inquiries were anything but professional. See, for example, the email exchange in Appendix F where Mr. Ory provided us with helpful, and timely information. Based on his statements to us, Mr. Ory appears to have been equally helpful with other organizations, who generally appear to have been closely aligned with MTC, perhaps because those were the only organizations who appear to have known to call the modeling professionals for questions (we found out from one of those organizations).

The obstruction that we faced we attribute to MTC's executives and counsel. To the extent Mr. Ory was not responsive when we began to ask questions that centered around how MTC and ABAG were handling state MPG regulations, we attribute that to MTC executive decisions, as evidenced by the fact that our inquiries to Mr. Ory were responded to by his supervisor, and not him.

<sup>10</sup> Government Code § 65080 (b)(2)(A)(i) reads, in relevant part:

No later than January 31, 2009, the state board shall appoint a Regional Targets Advisory Committee to recommend factors to be considered and methodologies to be used for setting greenhouse gas emission reduction targets for the affected regions. . . . The

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

of transparency and public accessibility in modeling of the sustainable communities strategy, in great detail.

For example, from the RTAC's 2009 final report:

## 2. Use of Modeling

This section of the report summarizes Committee discussions on the use of travel demand models and other modeling methods for SB 375 target setting and implementation. In our recommendations, we emphasize the need for MPOs to make modeling data and information regarding greenhouse gas emissions available to the public in a clear and transparent manner. [emphasis added] A network-based travel demand forecasting model allows for simulation of complex interaction among demographics, land use, development patterns, transportation, and other policy factors. A rigorously tested and validated travel demand model with well documented expert peer review will add to the credibility of greenhouse gas estimates.

In this section, “travel demand models” refers to the computer models currently in use at MPO’s for travel forecasting, ranging from relatively simple “four-step” models to more complex “four-step” models, to more sophisticated, activity-based simulation models. “Other modeling methods” refer in general to tools which either augment or replace travel demand models, and are likely to be spreadsheet-based tools.<sup>11</sup>

And also from the RTAC report:

Throughout its discussion, the Committee came to appreciate how complex modeling systems can be, and as a result, we recognize the vital importance of transparency in the modeling process. [emphasis added] Within the context of improved transparency, the Committee

---

advisory committee shall transmit a report with its recommendations to the state board no later than September 30, 2009. In recommending factors to be considered and methodologies to be used, the advisory committee may consider any relevant issues, including, but not limited to, data needs, modeling techniques . . .

<sup>11</sup> *Recommendations of the Regional Targets Advisory Committee (RTAC) Pursuant to Senate Bill 375*, p. 16. Appendix L.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

recommends that use of travel demand models and other modeling methods for SB 375 implementation include . . . assessment and documentation of existing travel demand model capability and sensitivity. . . .

When applying models in target setting and/or demonstration of meeting the target, inherent modeling uncertainties due to input data quality, assumptions, existing modeling capability, and sensitivity need to be well documented.<sup>12</sup>

The Committee could not have stressed more strenuously the importance of making full and open disclosures to the general public, and in a form that was accessible to the general public, in order for the public to understand the modeling that was done to analyze the sustainable communities strategy:

SB 375 requires that MPOs “...disseminate the methodology, results, and key assumptions of whichever travel demand models it uses in a way that would be useable and understandable to the public.” Cal. Govt. Code § 14522.2(a).

. . .

If the documentation is highly technical in nature, a summary of the assessments and sensitivity testing should be prepared which would be more generally understandable by a non-technical audience.<sup>13</sup>

## **F. The Two MTCs – A Question of Intent**

In fact, our experiences with MTC, with similar requests, at exactly the same time, couldn't have been more different with respect to the mandates of the RTAC report. At least initially, MTC's modeling professionals, including especially Mr. David Ory, couldn't have acted more consistently with the mandates of the RTAC report. He was helpful, and responsive, and appeared to understand our need to have access to the software models themselves to understand the analysis that MTC and ABAG had done, and to

---

<sup>12</sup> Id. at 18.

<sup>13</sup> Id.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

be able to submit informed comments. He made it clear that he was equally responsive in providing information to other organizations (albeit all of these organizations appear to have been ones closely aligned with MTC and ABAG).

On the other hand, MTC's executives and counsel, couldn't have been more obstructive, in making it hard for us, and delaying as long as possible, our receiving access to the modeling data, and, as a result, making it hard for us to understand MTC and ABAG's analysis of the draft Plan and the draft EIR, and making it hard to submit informed comments.

The only plausible explanation for this otherwise inexplicable difference between two sets of personnel in the same organization responding to related requests for similar data at exactly the same time, is that both sets of personnel were fully aware of our critical need for the information to understand MTC and ABAG's analysis and submit informed comments, and were aware of the fact that the comment period was well underway. For the software modeling professionals, their initial responsiveness and willingness to provide us with information in a timely fashion was indicia of their desire to make sure that we understood the analysis that had been performed<sup>14</sup> and were able to submit informed comments.

The MTC executives and counsel who so determinedly obstructed our requests for similar data at the same time, also appear to have been doing so because they knew of our critical need for the data to understand MTC and ABAG's analysis, and of our need to have the data as soon as possible to be able to submit informed comments. That they understood our need for the data and wanted to prevent our ability to submit informed comments, is the only plausible and reasonable explanation why they obstructed and delayed our request for week after week, as the clock ticked away the 55 day period for submitting comments on the Plan itself, and the 45 day period for submitting comments on the draft EIR.

## **G. MTC's Obstruction and Evasion – It Never Stopped**

<sup>14</sup> That is, until we began to ask questions about how MTC and ABAG handled the California MPG regulations—those questions were not responded to by MTC's modeler, rather they were immediately referred to his supervisor. Again, I don't fault the modeling professionals for this, rather, MTC and ABAG's senior executives and counsel.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

As we began to review the documents on MTC's modeling that were disclosed to us on April 19, 2013, and as it slowly dawned on us the sheer magnitude and extent of the irregularities in MTC and ABAG's assumptions and analysis, we began to ask questions seeking clarification of the EIR team and MTC and ABAG's modeling professionals. And, alas, but perhaps understandably, the same professionals that we had earlier come to respect and appreciate for their courtesy and responsiveness in answering questions, either stopped responding entirely, as did Mr. David Ory, or the EIR Coordinator, Ms. Carolyn Clevenger, who as we came closer and closer to the truth of what MTC and ABAG were doing with their models, became more and more evasive and elusive in her responses to my questions which became more and more simple and direct. I don't fault either Mr. Ory for not responding our latter inquiries, nor Ms. Clevenger for her astonishingly evasive and elusive answers to what eventually from me were simple and direct questions. For whatever reasons, Mr. Ory referred my questions about MTC and ABAG's handling of MPG regulations directly over to his supervisor rather than responding, and in the case of Ms. Clevenger's most artfully worded evasive communications, I suspect those communications were drafted by counsel for her.<sup>15</sup>

---

<sup>15</sup> Note that the more we looked at the data we had received from MTC, the more confident we were in our interpretation of that data, and thus our requests for clarification from MTC were simply acknowledgements from MTC of what the data itself said. Thus, there is no possibility that MTC misunderstood what we were asking for—acknowledgement in writing from them of indisputable facts about how they were modeling California's Clean Car Standards (Pavley 1) and how they were incorporating those results in their analysis. MTC's evasive and seeming obtuseness in response to a direct request for an admission of what unquestionably what MTC and ABAG were in fact doing, appears to be itself a further admission that MTC and ABAG know what they are doing is wrong.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

## II. The Smoking Gun

C187-6

So, was there a smoking gun in the data that MTC withheld for week after week, a reason why MTC delayed so long and fought so hard to keep us from understanding what they were doing to analyze the Plan? Indeed there appears to have been, but not just a smoking gun—there was an entire battery of smoking howitzers arrayed along the ridgeline as far as the eye can see.

Throughout this comment I will discuss the importance of the data that was withheld so long then finally disclosed to us on April 19, 2013. And, given the collapsed timeframe, there is much more in these several hundred documents that we have found that warrant—in fact demand—further research and inquiry. Also, there are also many additional issues that we had planned to comment on and have done preliminary research on. However, the delays in receiving the modeling data from MTC, together with the limited time allowed in the comment period overall, have prevented us from doing so. There's also the sheer number, and the gravity, of the deficiencies that we have found in the Plan and its analysis.

But with all that, one simple table may illustrate why MTC was so determined, and fought so hard, to delay disclosing information related to MTC and ABAG's models and analysis, and hence may explain why they fought so hard against disclosing to the public essential facts about their analysis of the Plan and draft EIR.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

 = Using real number for MPG. Clever! Makes Preferred Alternative and its high density housing mandates look better!

 = Using fake number for MPG. Shhhh . . . don't tell anyone! Makes Preferred Alternative and its high density housing mandates look better!

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

What this table<sup>16</sup> tells us is that MTC and ABAG are treating the identical regulations—California’s Clean Car Standards—differently in their analysis of the Plan and the draft EIR, depending upon whether considering the impact of those regulations will help or hurt their argument that the Preferred Alternative must be selected.

California’s Clean Car Standards were promulgated by the California Air Resources Board (CARB) in 2004, pursuant to AB 1493 (2002, Pavley), and became fully effective in 2009. The Plan and draft EIR call California’s Clean Car Standards “Pavley 1.” Pavley 1 governs the average miles per gallon (MPG) of the new passenger vehicle fleet sold in California from 2009 through 2016, and in the following years.

Pavley 1 will have a significant impact on the average MPG of the passenger vehicle fleet in use in California over the next 25 years.<sup>17</sup> We don’t have to

---

<sup>16</sup> The data in this table is derived entirely from the file, *MTC Model Run 2035\_03\_84, 2013 RTP/SCS CO2 and Criteria Pollutant Summary Results, September 11, 2012*, received in MTC’s Public Record Act disclosures, attached as Appendix G. This data contains vitally important information that was not disclosed to the public as part of the public disclosures accompanying the release of the draft Plan, the draft EIR, and accompanying documents—information that was essential for the public’s ability to understand the analysis performed by MTC and ABAG, and to submit informed comments.

This data represents the results of a model run of MTC’s software that looks at emissions from vehicles—which appear to generate the core analysis that MTC and ABAG used to evaluate the four Alternatives and No Project in the draft EIR. All tables of model runs that we received in response to our Public Records Act request were similar to the reported data in the attached file noted above, with only minor variations in the reported results between model runs, and between the alternatives, including between No Project and the four alternatives considered (and these variations between No Project and the four alternatives considered were assuredly within the margin of error of these models—a fact that does not appear to have been disclosed to the public).

<sup>17</sup> Please note that the results ABAG and MTC’s undisclosed models show for the MPG impact of Pavley 1 are included in their results shown for Pavley 1 + LCFS. However, CARB’s Low Carbon Fuel Standard (LCFS) is a set of standards for formulation of gasoline and other motor fuels, and as such, LCFS reduces CO<sub>2</sub> emissions when burned in the vehicle’s engine, but should have little or no impact on the vehicle’s MPG.

Pavley 1, on the other hand, regulates the minimum MPG of the passenger vehicles sold in the state during a given year. Therefore, it is a reasonable assumption to make that all

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

guess at that—MTC and ABAG modeled that impact,<sup>18</sup> though they have not disclosed to the public that they in fact did so nor have they disclosed to the public their results, presumably because they did not want the public to know the results of that analysis. And this may have been precisely why MTC fought so hard to keep this information from the public in delaying and obstructing our March 13, 2013 Public Records Act request<sup>19</sup>—because this information would need to be provided to us in response to our request.

MTC and ABAG's undisclosed models show that the Pavley 1 regulations will increase fleetwide MPG of California's passenger vehicles by more than 59% between 2010 and 2035.<sup>20</sup> And, since the amount of gasoline burned per vehicle mile traveled (VMT) is reciprocal to the MPG that a vehicle gets, we know that Pavley 1 will have the following inevitable and certain impacts between 2010 and 2035:

- Pavley 1 MPG regulations will reduce passenger vehicle emission-related particulate matter and pollutants per VMT by 37% (and adjusting for the forecasted 15.68% increase in VMT, 31.98% overall)
- Pavley 1 MPG regulations will reduce passenger vehicle emission-related CO<sub>2</sub> per VMT by 37% (and 31.98% overall)

---

or virtually all of the MPG increases attributed to Pavley 1 + LCFS in ABAG and MTC's undisclosed models are attributable solely to the impact of Pavley 1.

<sup>18</sup> See, for example, the table of data with model run results discussed in footnote 16 above (Appendix G). All model runs included the undisclosed results from running a post processor that evaluated the impact of Pavley 1 and Low Carbon Fuel Standard (LCFS) on CO<sub>2</sub> (User Guide to the post processor that assesses the impact of Pavley 1 and LCFS attached as Appendix H).

<sup>19</sup> Or, actually, among the reasons. The irregularities in the models, the analysis, and the assumptions, are simply breathtaking. I am only detailing several of them here, but there are many others.

<sup>20</sup> This is a simple calculation from the modeling results disclosed to us on April 19, 2013 (but withheld from us for week after week after our request on March 13—and also withheld from the public as a whole, who should have had access to this data). The calculation is simply the increase in fleetwide MPG for passenger vehicles from 20.18 in 2010 to 32.02 MPG in 2035 (for Preferred Alternative; other Alternatives including No Project appear to virtually the same).

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

- Pavley 1 MPG regulations will reduce gallons of gasoline used by passenger vehicles—and hence available to be taxed—per VMT by 37% (and 31.98% overall)

It is facially obvious from the above that Pavley 1 MPG regulations have an immense impact on the required analysis of the Plan and its draft EIR, and on the decisions that should be made about the Plan by MTC and ABAG, and by the public. But these impacts affect the Plan's Preferred Alternative and its high density housing-heavy land use / mass transit-heavy transportation plan radically differently, depending on which impact we are looking at.

Pavley 1's 37% reduction per VMT in passenger vehicle emission-related particulate matter and pollutants (and 31.98% overall) appears to have been welcomed by MTC and ABAG, and in fact was a significant assistance to them in their justification of their Plan. The draft EIR was required to disclose serious and unmitigatable health impacts to all of the new residents that MTC and ABAG are requiring to live in high density multistory multifamily units near mass transit in suburban and urban downtowns. Pavley 1's 37% reduction per VMT (and 31.98% overall) in these passenger vehicle emission-related particulate matter and pollutants by 2035 was a significant contributor in reducing, but not eliminating, those public health impacts. And, not surprisingly, MTC and ABAG included those impacts in their analysis of the Plan and the draft EIR.

However, they had a little problem to solve before doing so. As noted below, MTC and ABAG had already fabricated a mythical number for fleetwide MPG of passenger vehicles through 2035, which removed the 59% increase due to Pavley 1, and forecasting a number for MPG that was untethered and unrelated to any possible future scenario—an unchanging fleetwide MPG from 2010 through 2035. This appears to have been done to hide the impact of Pavley 1 regulations on reducing CO<sub>2</sub>. So, what to do to be able calculate the favorable impacts of Pavley 1's increased MPG on emissions related particulate matter and pollutants?

When fabricating data to produce the analysis that supports ones' objective of adopting the Preferred Alternative (or one of its variants based on the same models and analysis, Alternatives 3, 4, or 5, or some combination of the four), why stop now? And that appears to be exactly what MTC and

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

ABAG did. They appear to have embedded, and hid, a second number for passenger vehicle fleetwide MPG,<sup>21</sup> one that incorporates the 59% increase in MPG and thus produced in the model a resulting decrease of 37% per VMT (31.98% overall) in passenger vehicle emission-related particulate matter and other criteria pollutants.

So in this profoundly deceptive exercise, MTC and ABAG were able to produce analysis—in the same model—that projected that passenger vehicles would emit a constant amount of CO<sub>2</sub> per VMT through 2035, through the mythical assumption that Pavley 1's MPG regulations did not exist, and thus fabricating values for fleetwide MPG that were used in their models to generate those fabricated and grossly excessive forecasts of CO<sub>2</sub> emissions. And since their Plan was analyzed for its impact on reducing CO<sub>2</sub>, and the reduced CO<sub>2</sub> emissions from Pavley 1 MPG regulations were removed from the model by fabricating data to falsify the model's results, the only means of reducing greenhouse gases (GHGs), e.g., CO<sub>2</sub>, that the Plan's analysis recognized as existing were those due to land use and transit.

Since in another set of profoundly flawed assumptions and models, only those land use elements (high density housing and mixed use developments next to mass transit in suburban and urban downtowns) and transit elements (increased subsidies to mass transit) that MTC and ABAG appear to favor were defined as reducing CO<sub>2</sub> emissions, the Plan's models and analysis were designed from the beginning to produce analysis that could only find the Preferred Alternative or some close variant (such as the other three alternatives or some combination of the four) the environmentally and economically superior choice.

---

<sup>21</sup> There is simply no question that MTC's models do this. I trust that MTC and ABAG will simply concede this point. There are two different numbers for MPG in the main model that MTC and ABAG used, or not. It's a simple question with a yes-no answer, and the answer is yes. However, if MTC and ABAG choose to obfuscate and evasively avoid this obvious fact in their answer to this point in this comment in the Final EIR, I will file a comment to the Final EIR that details the evidence in as many ways as seems necessary. But I trust that at some point, MTC and ABAG will realize that misleading the public in the CEQA process is frowned upon, and that doing so grossly violates their responsibilities as public agencies as well.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

### **Plan Bay Area's Budget**

C187-7

But MTC and ABAG's disingenuous analysis and fabrication of results to support its desired outcomes did not stop there. Consider the decline in gasoline usage due to Pavley 1 regulations' 59% increase in fleetwide MPG for passenger vehicles in California from 2010 through 2035. MTC and ABAG's own undisclosed models compel the conclusion that gasoline usage by passenger vehicles will decline by 37% per VMT (and 31.98% overall) from 2010 through 2035 (as gasoline usage declines are simply the arithmetic reciprocal of the MPG increase).

If the retail price of gasoline keeps pace with inflation—an uncertain assumption since, as noted above, MTC and ABAG's MPG data compel a finding of an absolute decline of 31.98% in gallons of gasoline used in passenger vehicles by 2035--then total gas tax revenues to the Plan will be 31.98% less in real terms 2035 than they were in 2010.

Consider the position that MTC and ABAG found themselves in. A budget that forecasted total gas tax revenues to the Plan in 2035 31.98% less, in real terms, than in 2010, would not have allowed funding the massive multi-billion dollar mass transit projects that MTC and ABAG wanted to build. Not the \$4.5 billion dollar Trans Bay Terminal in San Francisco. Not the new rail lines that will carry passengers at a cost orders of magnitude greater than that of automobiles—rail lines that will require astronomical public subsidies per passenger mile. Nor would that budget have allowed all of the high density housing mandates that the Plan requires the cities and towns in the Bay Area to zone for, and incents them to build by withholding gas tax revenues designated for road and bridge maintenance from cities that don't actually get the housing built.

However, inconvenient facts are not an insurmountable problem—not ones that render impossible a budget that funds desired programs. New facts can be made up, or inconvenient facts can be assumed out of the models and out of the analysis—and none of this disclosed to the public.

Is this right? No, in fact it is profoundly wrong. But this appears to be exactly what MTC and ABAG have done with the analysis and justification for this Plan.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

Specifically with respect to the decline in gasoline usage due to the MPG impacts of Pavley 1, MTC and ABAG's financial models assume a 2.00% decrease in gasoline used per year through 2020.<sup>22</sup> However, MTC and ABAG's financial models then ignore the continuing impact of Pavley 1 on decreased gas sales due to increased fleetwide MPG through 2035.<sup>23</sup> And, presumably to "mitigate" the impact of declining gallons of gasoline sold through 2020, MTC and ABAG forecast an astounding 8.00% per year increase in the retail price of gasoline for those same years—3.5x the 2.2% rate of inflation<sup>24</sup> they assume in the Plan. These assumptions for extraordinary, and persistent price rises in the retail price of gasoline not only fully offset the impact on gas tax revenues of the reduction in gasoline used that their financial models forecast through 2020, but MTC and ABAG actually forecast increased gas tax revenues during those years.

Then, possibly to leave nothing to chance, MTC and ABAG forecast continuing gas price increases from 2020 through 2035 of 3.3% per year<sup>25</sup>—fully 50% higher than the 2.2% assumed rate of inflation<sup>26</sup> that the Plan is based on. In fact, including the 8% per year gas price increases through

<sup>22</sup> See, for example, *Regional Fuel Tax worksheet, 2013 RTP Model (State and Federal)\_Final* attached as Appendix I. Please note that this data was not made available to the public in the disclosures provided to the public as part of the information provided to the public by MTC and ABAG for the public's review of the Plan and draft EIR, and was only provided to us after weeks of delay and obstruction in the Public Records Act response that we received on April 19, 2013. This information was not only important, but was essential to the public's ability to understand the financial models that underlie the Plan, and should have been available to the general public as part of the disclosures MTC and ABAG were required to make about the Plan and the draft EIR.

<sup>23</sup> According to MTC and ABAG's own undisclosed models of the impact of Pavley 1 on fleetwide MPG, fleetwide MPG for passenger vehicles will increase by 14.68% (from 27.92 MPG in 2020 to 32.02 MPG in 2035), and hence gasoline used per VMT will decline a further 12.80% over that same period, and even after adjusting for added VMT, by well over 10% in absolute terms.

<sup>24</sup> See *Worksheet 2013 values - 2013 RTP Model (State and Federal)\_Final*, Appendix J. This was yet another assumption that was not disclosed as part of the Plan, the draft EIR, and their supporting documents, and was only identified by us in the disclosures we received after such long delay on April 19, 2013.

<sup>25</sup> Appendix I.

<sup>26</sup> Appendix J.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

2020, and the 3.3% per year gas price increases from 2020 through 2035, MTC and ABAG are forecasting a retail gas price in 2035 of 351% that of the retail gas price in 2010. That is, MTC and ABAG are forecasting a gas price that will increase by more than twice that the rate of inflation (171%) that their model forecasts over those same years. And, thus, the 31.98% decline in actual gallons of gasoline sold in 2035 over 2010, due to Pavley 1's MPG regulations, are more than offset by the model's assumed gas price increases. This is quite clever—constantly rising prices, far above the rate of inflation, and as far as the eye can see, while the actual number of gallons continues to fall, also as far as the eye can see. And thus the budget assumes that gas tax revenues go up and up and up while actual gallons of gas demanded at the gas pump go down and down.

Considering that MTC and ABAG appear to have an obvious incentive, as well as a seemingly well-honed track record for creating “facts” and thence forecasts that serve their objective of justifying Plan Bay Area and its policy elements, perhaps we should compare MTC and ABAG’s forecasts for gasoline price rises with the California state agency that is expert in these matters, the California Energy Commission (CEC). What we learn in doing so, leaves us in utter disbelief.

The CEC in 2011 produced a set of gasoline price forecasts from 2010 through 2030, projecting gas prices in 2010 dollars, coming up with a high price scenario, and a low price scenario. CEC appears to have considered the impact of Pavley 1 on gas prices (e.g., that Pavley 1 would reduce the

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

total numbers of gasoline used by passenger cars), though it's unclear how much of Pavley's impact in reducing demand they incorporated in their model.<sup>27</sup> And of course they could not have considered the effect of Pavley 2, which had not yet been proposed in 2011 when the CEC prepared its projections. So, since Pavley 2 will lead to additional, sharp declines in gasoline used by passenger vehicles and these CEC numbers may not have accounted for the fully impact of the reductions in gasoline usage due to Pavley 1, these CEC are assuredly considerably higher than a forecast that would be made today, but they do reflect the CEC's views of future gas prices in 2011, and without consideration of the impact of Pavley 2. Their projections<sup>28</sup> are nothing short of astounding, when considered along side of MTC and ABAG's forecasts for gas price increases in Plan Bay Area.

CEC's low price scenario projects retail gasoline prices, in real terms, to be 1.23% lower in 2030, than in 2011 (see table below). And, since CEC's projections did not account for the additional, substantial declines in gasoline usage due to Pavley 2—declines in usage that will be national, since Pavley 2 simply adopts in California the federal 2025 CAFÉ standards—CEC 2011 gas price forecasts must be viewed as considerably higher than they would be if Pavley 2 was considered. CEC's high end gas price forecast, in real terms, and with the same qualification, is that gas prices in 2030 will be 28.07% higher in 2030 than in 2011.

What sayeth MTC and ABAG? Surely, as California public agencies, MTC and ABAG would use the gasoline price forecasts of the state's energy agency, as those forecasts would presumably be considered authoritative. In developing a regional plan like Plan Bay Area, wouldn't it be improper, possibly even unethical, to disregard those forecasts that were available to MTC and ABAG in 2011, a full year before the formal analysis of the Plan and its draft EIR began in late July, 2012? And, since Pavley 2 was announced in January of 2012, and became fully effective in December of 2012, fully four months before their analysis was complete and MTC and ABAG released the draft Plan and draft EIR to the public, MTC and ABAG

<sup>27</sup> MTC and ABAG, on the other hand, were required to consider the full impact of Pavley 1 in reducing demand for gasoline from passenger vehicles, and their own undisclosed models compel a finding that total gas demand will drop by 31.98% by 2035, just due to Pavley 1.

<sup>28</sup> *CA Energy Commission gasoline price forecast 2010-2030*, Appendix K.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

surely would make appropriate adjustments downward if they used CEC's 2011 gasoline price assumptions to account for the significant impact of Pavley 2 on retail demand, and hence retail price, for gasoline. Wouldn't they?

Alas, we now know enough to predict that that won't be the case. And, sadly, MTC and ABAG act again consistently with their pattern. Their question appears to be, "what assumption do we need to make to enable us to justify the Plan we want to have" rather than "what assumption do we need to use to accurately reflect real world conditions" or "what assumption do we need to use to reflect the integrity and honesty that the public expects, and has a right to demand, from public agencies that are spending public funds"? We find that MTC and ABAG are projecting in their Plan, gasoline prices, in real terms, 85.30% higher in 2030 than in 2011.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

Gas Price Forecasts, Difference, Real Terms, 2011-2030<sup>29</sup>  
(% of 2011 gas price)

|      | CEC 2011 – Low | CEC 2011 – High | MTC/ABAG |
|------|----------------|-----------------|----------|
| 2012 | 101.23%        | 106.54%         | 105.80%  |
| 2013 | 102.47%        | 110.08%         | 111.94%  |
| 2014 | 103.40%        | 113.90%         | 118.43%  |
| 2015 | 104.63%        | 116.62%         | 125.30%  |
| 2016 | 104.32%        | 117.44%         | 132.56%  |
| 2017 | 103.70%        | 117.98%         | 140.25%  |

| 2021 | 101.23%        | 119.35%         | 167.93%  |
| 2022 | 100.00%        | 119.35%         | 169.77%  |
| 2023 | 99.07%         | 119.62%         | 171.64%  |
| 2024 | 97.84%         | 120.44%         | 173.53%  |
| 2025 | 96.91%         | 121.53%         | 175.44%  |
| 2026 | 97.22%         | 122.34%         | 177.37%  |
| 2027 | 97.53%         | 123.71%         | 179.32%  |
| 2028 | 97.84%         | 125.34%         | 181.29%  |
| 2029 | 98.46%         | 126.16%         | 183.29%  |
| 2030 | 98.77%         | 128.07%         | 185.30%  |

**Notes:**

1. CEC 2011 forecasts do not consider the impact of Pavley 2 on retail gasoline prices. Pavley 2 will lead to sharp declines in gasoline prices due to sharp declines in gasoline usage by passenger cars.
2. MTC and ABAG were required to account for the impact of Pavley 2 on gasoline prices in their budget for Plan Bay Area.

<sup>29</sup> Data for CEC are computed from yearly forecasted values in *CA Energy Commission gasoline price forecast 2010-2030*, Appendix K, and data for ABAG/MTC are computed from gas price increases per year in *Regional Fuel Tax worksheet, 2013 RTP Model (State and Federal)\_Final*, Appendix I.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

### Gas Price Forecasts, Difference, Real Terms, 2011-2030 (% of 2011 gas price)

#### **Notes:**

1. CEC 2011 forecasts do not consider the impact of Pavley 2 on retail gasoline prices. Pavley 2 will lead to sharp declines in gasoline prices due to sharp declines in gasoline usage by passenger cars.
2. MTC and ABAG were required to account for the impact of Pavley 2 on gasoline prices in their budget for Plan Bay Area.

It has oft been said that a picture can be worth a thousand words. But when it comes to MTC and ABAG—and the forecasts, assumptions, models, and omissions they fabricated and used to justify Plan Bay Area—a simple chart leaves one speechless.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

### California's Advanced Clean Car Standards ("Pavley 2")

C187-8

To summarize in a simple table what MTC and ABAG are doing here with respect to the impacts of Pavley 1 MPG regulations on emissions-related particulate matter and other criteria pollutants, CO<sub>2</sub>, and in their financial model:

#### Pavley 1 impacts:

|                                    | <b>Do the Impacts Benefit Preferred Alternative?</b> | <b>Did ABAG and MTC incorporate in results?</b>                 |
|------------------------------------|------------------------------------------------------|-----------------------------------------------------------------|
| <b>Particulates and pollutants</b> | YES                                                  | YES                                                             |
| <b>CO<sub>2</sub></b>              | NO                                                   | NO                                                              |
| <b>Gas tax revenues</b>            | NO                                                   | "Mitigated" with high gas prices until 2020, ignored after 2020 |

And MTC and ABAG's profoundly disingenuous models and analysis go from bad to worse. California's Advanced Clean Car Standards ("Pavley 2") were announced January 27, 2012,<sup>30</sup> and went into full effect December 31, 2012.<sup>31</sup> So, 14 months before the release of the draft Plan on March 22, 2013, and 14 months before the release of the draft EIR on April 2, 2013, MTC and ABAG had full knowledge of the Advanced Clean Car standards.

<sup>30</sup> *California Air Resources Board Approves Advanced Clean Car Rules, 20120127*, Appendix M.

<sup>31</sup> *California Air Resources Board Advanced Clean Car Rules, Final Approval, December 31, 2012*, Appendix N.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

In fact these standards were announced fully six months before the analysis of the draft EIR and its alternatives formally began in late July of 2012.

California's Advanced Clean Car Standards simply adopt for California the federal CAFÉ standards that require an average fleetwide MPG for passenger vehicles sold in 2025 of 54.5 MPG. These already on-the-books and final regulations affect the passenger vehicles sold in California from 2017 through 2025 and forward from there.

As MTC and ABAG did not model the impact of Pavley 2 like they did in their undisclosed models of the impact of Pavley 1, we must to engage in some informed estimates here (in the Table below). Pavley 2's MPG regulations begin to affect the passenger vehicle fleet sold in California beginning in 2017, and require the average MPG of the passenger vehicle fleet sold in California from 2025 and beyond to be at least 54.5 MPG. We also know from MTC and ABAG's undisclosed models that just from the impact of Pavley 1 alone, they are projecting the passenger vehicle fleet in use in 2035 to be 32.02 MPG—and we also know that the impact of Pavley 2 will additive to that of Pavley 1.

It defies all credulity to assume that the fleetwide MPG of the passenger vehicle fleet in 2035 would only be 40 MPG due to the added impact of Pavley 2, which requires all passenger vehicles sold from 2025 and forward to average at least 54.5 MPG, and whose much more stringent standards than Pavley 1 begin to be phased in for passenger vehicles sold from 2017 on. But let's assume, for the sake of argument, that that's our low estimate for the impact of Pavley 2 added to Pavley 1. However, a much more credible argument can be made that the impact of Pavley 2 added to Pavley 1 will lead to a fleetwide MPG of at least 45 MPG in 2035 (our "mid-range" estimate), and perhaps more likely closer to our high end estimate of 50 MPG in 2035.

Remember, Pavley 2's Advanced Clean Car Standards are on-the-books regulations that will govern the passenger vehicles sold in California from 2017 forward, hence for almost all of the Plan period. And yet the Plan and draft EIR completely ignore the impact of Pavley 2. This renders the Plan's analysis meaningless, and thus the Plan must be rejected.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

Consider the impact on emissions-related particulate matter and other criteria pollutants, CO<sub>2</sub>, and on the Plan's budget if the inevitable and certain impacts of Pavley 2 over the Plan period had been analyzed, considered in the Plan and its draft EIR, and disclosed to the public, as MTC and ABAG were required to do so:

Impact of Pavley 1 + Pavley 2:

|                                                       | <b>2010</b> | <b>2035</b> | <b>MPG<br/>increase</b> | <b>Gasoline<br/>decline<br/>per VMT</b> | <b>Absolute<br/>difference<br/>including<br/>added VMT</b> |
|-------------------------------------------------------|-------------|-------------|-------------------------|-----------------------------------------|------------------------------------------------------------|
| <b>Pavley 1</b>                                       | 20.18       | 32.02       | 58.67%                  | -36.98%                                 | -31.98%                                                    |
| <b>Pavley 1 +<br/>Pavley 2 low<br/>estimate</b>       | 20.18       | 40.00       | 98.22%                  | -49.55%                                 | -42.83%                                                    |
| <b>Pavley 1 +<br/>Pavley 2 mid<br/>range estimate</b> | 20.18       | 45.00       | 122.99%                 | -55.16%                                 | -47.68%                                                    |
| <b>Pavley 1 +<br/>Pavley 2 high<br/>end estimate</b>  | 20.18       | 50.00       | 147.77%                 | -59.64%                                 | -51.56%                                                    |

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

**Impact of Pavley 1 + Pavley 2 on gasoline usage  
Absolute decline, and decline per VMT  
2010 - 2035**

To repeat myself, when it comes to MTC and ABAG—and the forecasts, assumptions, models, and omissions they fabricated and used to justify Plan Bay Area—a simple chart leaves one speechless.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

### III. The Inevitable Response

**C187-9** MTC and ABAG will assuredly respond with indignation to the points raised in Section II above, and will likely make the following claims in response:

- SB 375 compels MTC and ABAG to ignore the impacts of state MPG regulations on CO<sub>2</sub>,
- MTC and ABAG reasonably relied on the modeling software that they used for emissions, EMFAC2011, and if there were any deficiencies in the EMFAC2011 modeling software it was the fault of the developers of the software (California Air Resources Board (CARB)),

I will comment here on each of these expected responses from MTC and ABAG, in the hopes that it will give the two lead agencies guidance in fully making their case with respect to each of these claims, and, in fact, specifically ask that they answer the following questions if they do make either or both of the above claims above.

#### A. SB 375

**C187-10** From the draft EIR, page 2.5-43:

The analysis conducted for Criterion 1 focuses on carbon dioxide (CO<sub>2</sub>) emissions related to the operation of passenger vehicles and light duty trucks. Emissions for Criterion 1 are considered to be conservative estimates because they are presented without accounting for reductions in mobile source emissions that would be expected to result from ongoing implementation of Pavley 1 and the LCFS; per SB 375 the impact assessment does not include the emissions reductions from these legislative requirements. (emphasis added).

Simple enough. However, I've read the statute, and the plain language of the statute does not support this reading. As an attorney and as a former law clerk to a state supreme court justice, I have some experience in close and careful reading of statutes. So, rather than a blanket denial, I hereby request that any such claim by MTC and ABAG in the Final EIR include:

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

1. The express provision(s) of SB 375 that MTC and ABAG are relying on for this interpretation,
2. How the plain language of this provision (these provisions) supports your interpretation, or if you are conceding that the plain language does not support this interpretation, what specific legal authority you are relying on to support an interpretation of the statute that is not supported by its plain language,
3. Do you believe the statute, or whatever legal authority you are relying on, compels, or simply permits MTC and ABAG to ignore the impact of state MPG regulations on CO<sub>2</sub> emissions, and if it simply permits MTC and ABAG to ignore the impact of state MPG regulations on CO<sub>2</sub> emissions, what was the reasoning relied upon by MTC and ABAG in deciding to ignore that impact,

C187-11

4. Assuming, for the sake of argument only, that the statute permits MTC and ABAG to ignore the impact of state MPG regulations on CO<sub>2</sub>, how does that further permit MTC and ABAG to:
  - a. Use models that fabricate data and produce model results that are known to be false,
  - b. Use models that have multiple values for a single variable that must be consistent in its use throughout the model (e.g., fleetwide MPG for passenger vehicles) for the model to be logically consistent and produce valid results,
  - c. Fail to disclose to the public the full results of the modeling that MTC and ABAG performed but did not disclose, of Pavley 1's impact on MPG, emission-related particulate matter and other criteria pollutants, and CO<sub>2</sub>,

C187-12

5. How does any of the above accord with MTC and ABAG's duties and responsibilities as lead agencies in the environmental review process where full and thorough analysis of relevant factors and impacts is required, and full disclosure of both the analysis and all significant impacts is mandated—whether or not that analysis and those impacts support the conclusions the lead agency or agencies would like to reach?

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

And, doesn't your failure analyze and disclose all impacts make a mockery of CEQA, which is supposed to inform the public of anticipated actual, not constructive, reality?

6. How does the level (and lack) of disclosure to the public accord with the RTAC report's mandates with respect to full public disclosure of all modeling results?

7. Please also comment on how the disclosures made by MTC and ABAG in the draft Plan, draft EIR, and in the supplemental documents that were released with the draft Plan and draft EIR address the RTAC reports mandate on p. 19 that "[t]he assessment and documentation should identify areas where the model lacks capacity for analysis of a factor or policy, and any factors or policy for which the model sensitivities fall outside the range of results documented in research literature."<sup>32</sup>

## B. EMFAC2011

**C187-13** According to the draft EIR, and my email correspondence with MTC, MTC and ABAG used the CARB-supplied software modeling program EMFAC2011 to model impacts such as MPG, emissions-related particulate matter and other criteria pollutants, and CO<sub>2</sub>. And, while MTC's email correspondence with me was unnecessarily evasive and vague on this issue, it is unquestionable and indisputable that MTC and ABAG used the CARB-supplied postprocessor<sup>33</sup> that takes EMFAC2011 data and evaluates the impact of Pavley 1 (and LCFS) on CO<sub>2</sub>, and only on CO<sub>2</sub>—with all other impacts of Pavley 1 (and LCFS) on emission-related particulate matter and other criteria pollutants performed in the main EMFAC2011 model itself.

As noted above, I anticipate the following response from MTC and ABAG in their Final EIR:

<sup>32</sup> *Regional Targets Advisory Committee Final Report*, pp. 16-19, Appendix L.

<sup>33</sup> *Pavley I + Low Carbon Fuel Standard Postprocessor Version 1.0 User's Guide*, Appendix H.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

MTC and ABAG reasonably relied on the modeling software that they used for emissions, EMFAC2011, and if there were any deficiencies in the EMFAC2011 modeling software it was the fault of the developers of the software (California Air Resources Board (CARB))

If so, I would appreciate answers to the following questions in the Final EIR to fully understand any such claim or contention by MTC and ABAG:

C187-14

1. Do MTC and ABAG thereby claim that their analysis of the Plan and draft EIR cannot be challenged even if the modeling software they used was deficient, and even though they are lead agencies? How does this accord with MTC and ABAG's responsibilities as lead agencies, and what legal arguments do MTC and ABAG use to contend that software models supplied by third parties can be used by lead agencies, with all deficiencies in the analysis produced by that third party software totally insulated from attribution to the lead agencies themselves,

C187-15

2. It's clear that MTC and ABAG (executives, counsel, and modeling professionals) are fully aware of the deficiencies in the modeling software used in analyzing the Plan and its draft EIR that are outlined in Section II above. Please admit or deny that MTC and ABAG were, and are, aware of these deficiencies.<sup>34</sup>

C187-16

3. Do MTC and ABAG claim that they were required by statutory or regulatory mandate to use EMFAC2011 for their analysis of the Plan and its draft EIR, and if so, please provide specific citation to that statutory or regulatory mandate.

4. If MTC and ABAG claim that if they were required, or alternatively, were permitted to rely on a software program for part of their analysis that had known, and material limitations or deficiencies, such as those outlined in Section II above, do MTC and ABAG further claim that they have no duty or responsibility as lead agencies to remedy or correct these shortcomings,

<sup>34</sup> Please also note that Question 7, under SB 375 above, is also relevant to this question—please address in your answer how the draft Plan, draft EIR, and supporting documents released at the same time accord with the RTAC report's mandate on p. 19 that "[t]he assessment and documentation should identify areas where the model lacks capacity for analysis of a factor or policy, and any factors or policy for which the model sensitivities fall outside the range of results documented in research literature." Appendix L.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

limitations, or flaws in the software program that they relied on in their analysis, such as through the “other modeling methods” described in the RTAC report on page 16<sup>35</sup>:

‘Other modeling methods’ refer in general to tools which either augment or replace travel demand models, and are likely to be spreadsheet-based tools.

and also as described on p. 17<sup>36</sup>:

[T]he Committee concluded there was a need to augment travel demand models with other methods to achieve reasonable levels of sensitivity for SB 375 implementation purposes. These other methods include:

...

“Post processor tool”, wherein MPOs would apply the tool to adjust outputs of their travel demand model such that they account for areas where the model lacks capability, or is insensitive to a particular policy or factor.

<sup>36</sup> Id.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

#### **IV. Plan Bay Area, at its core, is based on models, assumptions, forecasts, and omissions that are gravely deficient and profoundly dishonest**

Because of the extent and nature of the deficiencies in the Plan and its draft EIR, I will limit my comments here to several key issues.<sup>37</sup> I offer here not only my own analysis, but also refer to two submitted comments on the Plan and its draft EIR that are important in their own right, and are illustrative of a number of other comments that I have read in draft form or am otherwise familiar with.

The following, together with these additional comment letters, provides unassailable and indisputable facts and analysis that establish conclusively that the Plan will not and cannot work, even according to its own premises, which are in and of themselves deeply flawed.

Please note that given the short time allowed for analyzing and responding to this Plan and its draft EIR, there are many other deficiencies that will simply not get noted by me or by any member of the public, because we have not been given enough time to review and comment on the Plan and its draft EIR.

The points I raise herein not only discredit the Plan, the agencies promulgating it, and the process—they de-legitimize them. Together they paint a devastating picture of two unaccountable agencies and a process that has gone terribly awry.

C187-17

#### **A. The Plan's transit elements will not increase ridership, will not reduce greenhouse gases (GHGs), and will do nothing to help lower income citizens who are dependent on transit for their personal mobility**

<sup>37</sup> Because of the importance of detailing in Section II the critical importance of the information that was unreasonably withheld from me and my colleagues for week after week by MTC—information that should have been available to all of the public during the entire comment period on the Plan and its draft EIR—some of the information in Section II of this comment will necessarily need to be repeated in this section of the comment as well.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

I am attaching here<sup>38</sup> the comment letter submitted by Tom Rubin on Plan Bay Area's conformity analysis on Friday, May 3, 2013. Conformity analysis is a federal Clean Air Act requirement--essentially it requires that the transit elements of the Plan be reasonable and achievable. I have not included the appendices in the interests of space.

Mr. Rubin is one of the nation's leading experts in transportation. He built and led the leading transportation and land use consulting practice for a then-Big 8 firm in the 1980s, then served as chief financial officer for the nation's then third largest public transit agency (in the Los Angeles area) from the late 1980s through mid-1990s. He's been a highly respected independent consultant since then.

Mr. Rubin is also a long time Bay Area resident, and is deeply committed to honest government and effective public policy. Mr. Rubin cares deeply about transit that works and serves the interests of transit dependent folks that need it (largely lower income residents who rely on bus routes for personal mobility).

Mr. Rubin concludes, based on indisputable data and analysis:

- Plan Bay Area ignores the one form of transportation subsidies that are proven to increase transit usage, benefit the environment, and benefit lower income, transit-dependent residents (lowering fares and increasing service quality on existing routes, especially bus lines),
- The Plan continues the same transit strategies that have been deployed for the past 30 years in the Bay Area that have led to massive increases in the cost of transit while ridership has declined in absolute numbers (not just per capita usage),
- MTC and the Bay Area transportation and transit agencies have an appalling record of cost overruns for its transit projects, and
- MTC and ABAG are substantially overestimating expected revenues by willfully and intentionally ignoring the full impact of already on-the-books regulations regarding average mileage per gallon of the vehicle fleet

---

<sup>38</sup> *Tom Rubin conformity comment, Appendix O.*

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

sold in California that will dramatically reduce gasoline tax revenues available to this Plan (a point made at length in this comment as well).

I have read a number of other comments in draft form that will be submitted by other persons that offer similarly devastating, factual and analytically unassailable critiques of the transit elements of the Plan. Any one of them individually discredits and invalidates the transit elements of the Plan—and each offers complementary and essential facts and analysis in doing so.

C187-18

**B. The Plan's mandate requiring that 80% of all new housing in the Bay Area be built in high density, multistory, multifamily attached units near mass transit in suburban and urban downtowns will not reduce GHGs**

I am also attaching here<sup>39</sup> the letter, in draft form, that has been submitted by Bob Silvestri as his comments on draft Plan Bay Area and its draft EIR.

Mr. Silvestri is an architect, an affordable housing developer, an environmental activist, and a respected expert on land use issues. Mr. Silvestri is a longtime resident of Marin County who is frequently quoted in the local press, and he has authored a book on Plan Bay Area called *The Best Laid Plans*.

Mr. Silvestri's report not only establishes that the Plan's draft EIR fails to provide "proof of the efficacy of the proposed Plan or the Alternatives in reducing per capita or overall greenhouse gas emissions (GHGs), to meet SCS goals," pp. 1-2, but it concludes "that Plan Bay Area and the Alternatives will increase overall and per capita GHGs rather than decrease them." *Id.* at p. 2.

I am familiar with at least a dozen other comment letters that raise profound and material questions about the Plan's land use elements, or about the forecasts, assumptions, models, and omissions that underlie the Plan and its draft EIR. Each of them discredits and invalidates the foundations of the Plan, and does so based on analytically-sound and empirically-based assessments of the Plan.

<sup>39</sup> *Bob Silvestri comment*, Appendix P.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

Plan Bay Area is a transportation plan, and a land use plan. Mr. Rubin's report and others establish that the transportation elements of the Plan will not reduce GHGs, will not increase ridership, and will not help lower income residents who are dependent on public transit for personal mobility. These reports show that the Plan leaves the Bay Area's local roads and bridges dangerously underfunded in order to fund massive mass transit projects that will have limited or no efficacy in leading to gains in transit ridership and will have no beneficial environmental effects. Mr. Silvestri's report together with more than a dozen others, in turn, establish that the land use elements of the Plan will similarly not meet their stated objectives (reducing GHGs), and in fact will be counterproductive.

If the transportation plan and the land use plan won't work and cannot work, and in fact are counterproductive, what then are we left with? A Plan that is bereft of public benefits, that limits our ability to live where and how we wish as well as how we can travel, and that dramatically limits our ability to make our own decisions as individual residents, and as cities and counties. And we are left with a Plan that imposes massive and undisclosed unfunded mandates on the cities and counties in the Bay Area.

Could it get any worse than this? Yes, unfortunately it can. A Plan this fatally flawed and lacking in integrity could only have been fabricated and sold to the public through misleading representations and profoundly dishonest analysis. And it has been.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

C187-19

**C. The Plan and its draft EIR consider the impact of emission and mileage standards in ways that are misleading and profoundly dishonest**

The following chart<sup>40</sup> summarizes the discussion that follows:

| California Air Resources Board (CARB) MPG regulation                                                                                               | Particulates and pollutants other than CO2                                                                                                                                                                                                                                                                                                                      | CO2                                                                                                                                                                                                                                                                                                | Reduction in gasoline use and gas tax revenues                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

## **1. California's Clean Car Standard ("Pavley 1") and Advanced Clean Car Standard ("Pavley 2")**

California has two major sets of regulations that set mandates for the average miles per gallon (MPG) of the new passenger vehicle fleet sold in the state in a given year. Both have been promulgated by the California Air Resources Board (CARB) pursuant to the authority granted it by Assembly Bill 1493 (2002, Pavley).

### Pavley 1:

California's Clean Car Standard ("Pavley 1") governs the passenger vehicle fleet sold in the years 2009 through 2016 (and beyond). Pavley 1 regulations became effective and final in 2009.

Pavley 1 became effective before MTC and ABAG's analysis of Plan Bay Area's draft EIR began formally in July of 2012. Thus, all impacts attributable to Pavley 1 were required to be fully analyzed by ABAG and MTC and fully disclosed to the public.

### Pavley 2:

California's Advanced Clean Car Standard ("Pavley 2") was announced by CARB on January 27, 2012<sup>41</sup>, and these regulations became final on December 31, 2012.<sup>42</sup> Pavley 2 adopts in California the federal CAFÉ MPG standard that requires the passenger vehicle fleet sold in 2025 and later to average 54.5 MPG. Pavley 2 governs new vehicles sold between 2017 through 2025 (and beyond).

Pavley 2 became effective during the period of time that MTC and ABAG performed their analysis of the draft Plan and its draft EIR—in fact, it became fully effective almost three months before the draft Plan was released on March 22, 2013, and more than three months before the draft EIR was released on April 2, 2013. Thus, all impacts attributable to Pavley

<sup>41</sup> *California Air Resources Board Approves Advanced Clean Car Rules, 20120127*, Appendix M.

<sup>42</sup> *California Air Resources Board Advanced Clean Car Rules, Final Approval, December 31, 2012*, Appendix N.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

2 were required to be fully analyzed by ABAG and MTC, and fully disclosed to the public.

The draft Plan and draft EIR mention both Pavley 1 and Pavley 2 in several locations.<sup>43</sup> However, the impacts of Pavley 1 were analyzed differently according to whether they were favorable to the Preferred Alternative. The impacts that were favorable to the Plan were incorporated in the analysis and results. The impacts that were not favorable to the Plan were either analyzed but not incorporated into the results, or were minimized by the use of improper and unjustifiable assumptions. The impacts of Pavley 2--which would have been devastating on the Plan's analysis of CO<sub>2</sub> and on the Plan's budget--were ignored entirely.

Pavley 1 and Pavley 2 each lead to substantial increases in the average MPG of the passenger vehicle fleet sold in California--and over time, in the average MPG of the passenger vehicle fleet in use in the state. ABAG and MTC's own, undisclosed models<sup>44</sup> show that Pavley 1 increases the average MPG of the passenger vehicle fleet in use in the Bay Area by almost 60% (from 20.18 MPG in 2010 to 32.02 MPG in 2035 in their analysis of the Preferred Alternative, with almost identical results projected for the other alternatives including No Project).<sup>45</sup>

---

<sup>43</sup> See, for example, draft EIR, p. 2.5-43; Financial Assumptions, p. 4.

<sup>44</sup> The data source for the charts below is from MTC's own model run results, attached here as Appendix G, *MTC Model Run 2035\_03\_84, 2013 RTP/SCS CO<sub>2</sub> and Criteria Pollutant Summary Results, September 11, 2012.pdf*.

<sup>45</sup> Please note that the results that ABAG and MTC's undisclosed models show for the MPG impact of Pavley 1 are included in their results shown for Pavley 1 + LCFS. However, CARB's Low Carbon Fuel Standard (LCFS) is a set of standards for formulation of gasoline and other motor fuels, and as such, LCFS reduces CO<sub>2</sub> emissions when burned in the vehicle's engine, but should have little or no impact on the vehicle's MPG.

Pavley 1, on the other hand, regulates the minimum MPG of the passenger vehicles sold in the state during a given year. Therefore, it is a reasonable assumption to make that all or virtually all of the MPG increases attributed to Pavley 1 + LCFS in ABAG and MTC's undisclosed models are attributable solely to the impact of Pavley 1.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

### Miles Per Gallon of Passenger Vehicle Fleet after Pavley 1 / LCFS

|                                   | 2000  | 2005  | 2010  | 2015   | 2020   | 2025<br>(extra-<br>polated) | 2030<br>(extra-<br>polated) | 2035  |
|-----------------------------------|-------|-------|-------|--------|--------|-----------------------------|-----------------------------|-------|
| MPG<br>after<br>Pavley 1<br>/LCFS | 19.69 | 20.09 | 20.18 | 23.09  | 27.92  | 29.29                       | 30.65                       | 32.02 |
| %<br>increase                     |       | 2.03% | 0.45% | 14.42% | 20.92% | 4.89%                       | 4.67%                       | 4.46% |

A reasonable assumption would be that by the end of the Plan Bay Area planning period in 2040, the percentagewise increase in average fleetwide MPG due to Pavley 2 will be approximately the same as that of Pavley 1, and those impacts will be additive, leading to an average MPG for the vehicle fleet in use in California of at least 45 MPG and more likely close to 50 MPG.<sup>46</sup>

<sup>46</sup> ABAG and MTC's undisclosed models show that from Pavley 1's second year in 2010 until 2035, fleetwide MPG gains attributable to Pavley 1 will be more than 59% (from 20.18 MPG in 2010 to 32.02 MPG in 2035). Pavley 2 requires the average new passenger vehicle sold from 2025 and later in California to average at least 54.5 MPG. A

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

Why is this important? Because of the massive impact of these vehicle fleet MPG gains on three of the most important considerations in the Plan: CO<sub>2</sub> emissions; emission-related particulate matter and other pollutants; and the budget.

To restate the above, we know from ABAG and MTC's own, undisclosed models, that Pavley 1 alone will increase average fleetwide MPG by almost 60% between 2010 and 2035. As gallons of gasoline burned are reciprocal to MPG, we know as a matter of simple arithmetic that Pavley 1 will reduce gallons of gas burned by passenger vehicles by more than 37% per vehicle mile traveled (VMT) (and after adjusting for the 15.68% increase in VMT, by 31.98% overall) between 2010 and 2035.

This means that according to MTC and ABAG's own, undisclosed models, as a matter of simple arithmetic, that the Pavley 1 MPG regulations will:

- reduce emission-related particulate matter and pollutants from passenger vehicles (the dominant source of these emissions) by more than 37% per VMT (and 31.98% overall) by 2035,
- reduce CO<sub>2</sub> from passenger vehicles by more than 37% per VMT (and 31.98% overall) by 2035 , and
- reduce gallons of gasoline sold per VMT by more than 37% (and by 31.98% overall) by 2035.

ABAG and MTC were required to account for these effects and to faithfully incorporate these effects into the results of their analysis. But this is precisely what ABAG and MTC did not do.

---

reasonable assumption would be that 23 years after Pavley 2 regulations begin to first affect the passenger vehicle fleet sold in California (2017)—that is by 2040—that the impact of Pavley 2, added to the impact of Pavley 1 (which appears to cap out at just over 32 MPG in 2035), will lead to a further increase of close to 60% in the fleetwide MPG by 2040, or to a fleetwide average of just over 51 MPG.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

Pavley 1 impacts:

|                                    | <b>Do the Impacts Benefit Preferred Alternative?</b> | <b>Did ABAG and MTC incorporate in results?</b>                 |
|------------------------------------|------------------------------------------------------|-----------------------------------------------------------------|
| <b>Particulates and pollutants</b> | YES                                                  | YES                                                             |
| <b>CO<sub>2</sub></b>              | NO                                                   | NO                                                              |
| <b>Gas tax revenues</b>            | NO                                                   | “Mitigated” with high gas prices until 2020, ignored after 2020 |

When the impact of Pavley 1 MPG regulations benefits their Plan--as it does with emission-related particulate matter and pollutants—MTC and ABAG incorporate those impacts in their analysis and in the results they report to the public. Where the impact of Pavley 1 MPG regulations doesn't benefit their Plan, when in fact it renders their Plan utterly unnecessary—as it does with CO<sub>2</sub> emissions—MTC and ABAG ignore those impacts in their analysis. Nor do they disclose to the public the results of the analysis they actually ran but didn't incorporate in their assessment of the Plan.<sup>47</sup>

<sup>47</sup> MTC and ABAG attempt to deflect this objection by saying on p. 2.5-43 of the draft EIR,

Emissions for Criterion 1 are considered to be conservative estimates because they are presented without accounting for reductions in mobile source emissions that would be expected to result from ongoing implementation of Pavley 1 and the LCFS; per SB 375 the impact assessment does not include the emissions reductions from these legislative requirements." (emphasis added).

First, no reasonable reading of the text of the statute supports such an interpretation. Second, the CO<sub>2</sub> reductions attributable to the Pavley 1 regulations alone by 2035, according to ABAG and MTC's own, undisclosed models, will be

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

And, last, when the impact of Pavley 1 MPG regulations requires ABAG and MTC to accommodate them in the budget, as fewer gallons of gasoline sold equals lower gas tax revenues for the Plan's projects and initiatives, ABAG and MTC appear to have "mitigated" the impact of those declining gallons of gasoline sold by assuming strikingly high increases in the price of gasoline each of those years. Thus, ABAG and MTC models show decreases of 2.00% per year through 2020 in gallons of gas sold, but "mitigate" those decreases in the gallons of gasoline sold by assuming that the retail price of gasoline will increase by 8.00% per year through those same years.<sup>48</sup> Was it a simple matter of adjusting the financial model's assumption regarding the price per gallon of gas sold to make the problem of Pavley 1's impact of reducing the number of gallons sold per year through 2020 go away? If so, problem solved.

What about after 2020? ABAG and MTC's own undisclosed models show that fleetwide MPG continues to rise substantially due to the impact of Pavley 1's MPG regulations, past 2020 and at least until 2035.<sup>49</sup> Yet ABAG and MTC ignore this impact entirely on the budget. Could it be because they could only "mitigate" the impact of the gasoline usage declines on their budget with an offsetting assumption of a 8.00% per year increase in the

---

10-12x the amount that their models show will be the difference between their Preferred Alternative and No Project that same year. When one considers the impact of both Pavley 1 and Pavley 2 in the last year of the Plan, 2040, those MPG regulations, which are already on the books now and fully effective, will lead to more than 16x the CO<sub>2</sub> reductions than the CO reductions from choosing the Preferred Alternative over No Project—even assuming the rest of the Plan's models and assumptions are correct.

ABAG and MTC are like a doctor who insists that the patient (the public) take an immensely costly and risky regimen of treatment that has no possibility of curing the patient and has serious side potential side effects that may kill the patient, while failing to tell the patient that the treatment is entirely unnecessary because the patient is sure to get better anyway.

<sup>48</sup> *Regional Fuel Tax worksheet, 2013 RTP Model (State and Federal)\_Final*, Appendix I.

<sup>49</sup> MTC and ABAG's models show fleetwide passenger vehicle MPG increasing an additional 14.68% between 2020 and 2035 due to the impact of Pavley 1, leading to an additional decline in gasoline used per VMT by the passenger vehicle fleet of 12.80%.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

retail price of gasoline only for 7 years until 2020, but doing so for additional years beyond that would draw too much attention?

The Plan already uses the astonishing device of a plug number. Their expenditure plans, assuming their programs come in on budget--which Mr. Rubin's report shows is not even plausible--are underfunded by 5%. Do ABAG and MTC dial back their expenditure plans by 5% to keep their budget in balance? Of course they don't. They insert a plug number of 5% of the budget for "unanticipated," "anticipated" revenues. Yes, they really call it that.<sup>50</sup>

Pavley 2 impacts:

|                                    | <b>Do the Impacts Benefit Preferred Alternative?</b> | <b>Did ABAG and MTC analyze and incorporate in results?</b> |
|------------------------------------|------------------------------------------------------|-------------------------------------------------------------|
| <b>Particulates and pollutants</b> | YES                                                  | NO                                                          |
| <b>CO<sub>2</sub></b>              | NO                                                   | NO                                                          |
| <b>Gas tax revenues</b>            | NO                                                   | NO                                                          |

And what of California's Advanced Clean Car Standards ("Pavley 2")? Those regulations governing the passenger vehicle fleet sold in California from 2017 through 2025 and beyond, will have at least as great an effect on fleetwide MPG as Pavley 1, and Pavley 2's impact will be additive—in addition to—that of Pavley 1. And all completely unanalyzed and ignored in the Plan and its draft EIR.

---

<sup>50</sup> Plan, p. 64.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

## **2. The benefits to the Preferred Alternative of incorporating Pavley 1 impacts on emission-related particulate matter and pollutants**

The Preferred Alternative mandates that 80% of all new housing units be in high density, multifamily, multistory projects near mass transit in suburban or urban downtowns. The Plan was required to disclose what it described as significant and unmitigatable impacts on human health to the residents who will live in those units.

The draft EIR discusses in section 2.2(d) on page 2.2-81,<sup>51</sup> the mitigations it recommends to reduce those health risks to people who will live in these new high density housing units. Those include air filtration units for each living unit, and presumably may mean, at least in some locations, windows that don't open. Of course, in a suburban home, "air conditioning" means open two windows, and let the breeze blowing through the trees flow through your house.

The draft EIR further suggests keeping housing units at least 500 feet from freeways, and as far from trucks, buses, and rail as possible, and recommends planting as much vegetation as possible. The Plan's mitigations sound like recreating the living conditions in a single family home in a suburban town, but alas, the Plan mandates that 80% of all new housing units be in these high density dwelling units near transit in suburban and urban downtowns.

Given these significant and unmitigatable health risks posed by the Plan's mandates that 80% of all new housing units be built in these conditions, it makes great sense that ABAG and MTC would want their analysis of the Plan to incorporate the significant reductions in emission-related particulates and pollutants that will result from Pavley 1, and that's exactly what they've done. While there are a number of other regulations<sup>52</sup> that contribute to the significant, and persistent declines in these particulates and pollutants during

---

<sup>51</sup> *DEIR section 2.2(d) Mitigation measures, Appendix Q.*

<sup>52</sup> Especially CARB's Low Emission Vehicle (LEV) and Low Emission Vehicle II (LEV II) regulations.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

the Plan period which can be seen in the Plan's model results,<sup>53</sup> the estimated 37% per VMT (and after considering the 15.68% increase in VMT, 31.98% overall) reduction in these particulates and pollutants due to the passenger vehicle fleet and attributable solely to Pavley 1's increase in fleetwide MPG by 2035 were a major factor in the Plan's analysis, and in the reduced, but nowhere near eliminated, health risks to the residents in the mandated 80% of all new housing units that must be high density units near transit in suburban and urban downtowns.

## **2. The benefits to the Preferred Alternative of ignoring Pavley 1 impacts on CO<sub>2</sub>**

Reporting the CO<sub>2</sub> results of Pavley 1 would have required ABAG and MTC to disclose that the Pavley 1 regulations, together with CARB's Low Carbon Fuel Standards (LCFS) will lead to ten to twelve times (10 to 12 times) the reduction in CO<sub>2</sub> than the reductions in CO<sub>2</sub> that their land use and transportation plan elements would produce, even if their models were to be believed and were believable.<sup>54</sup> We don't need to guess at this difference. ABAG and MTC's own models show us this, though none of this has been disclosed to the public.

MTC's own model run on November 6, 2012<sup>55</sup> shows that even assuming ABAG and MTC's high density housing mandates and additional mass transit subsidies produce all of the GHG gains that ABAG and MTC believe they will, the difference between No Project and ABAG and MTC's Preferred Alternative is only 3.01 thousand tons per day of CO<sub>2</sub> out of more than 100 tons per day for either No Project or the Preferred Alternative. That is, assuredly within the margin of error, even assuming ABAG and MTC's models are correct. And at an appalling cost—not only those borne by individual members of the public and in public sector spending at all levels and through the massive new unfunded mandates, but also upon Bay

<sup>53</sup> For example, see model results in *MTC Model Run 2035\_03\_84, 2013 RTP/SCS CO<sub>2</sub> and Criteria Pollutant Summary Results, September 11, 2012*, Appendix G, but all model runs were similar to these results.

<sup>54</sup> Of course as discussed elsewhere, those models are not believable.

<sup>55</sup> *MTC Model Run 2040\_03\_78, 91, 2013 RTP/SCS CO<sub>2</sub> and Criteria Pollutant Summary Results, November 6, 2012*, Appendix R.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

Area residents' ability to live where and how they choose, travel the way they wish to, and upon their ability to make their own decisions within their own communities.

It's instructive to display the data in ABAG and MTC's own models, in a few simple charts, to see the misleading story that they are telling the public about their Plan, and compare that story with what their own data actual shows.

*ABAG and MTC's narrative—"there's a massive difference between No Project and our Preferred Alternative"*

ABAG and MTC tell the public, in effect, that their analysis shows a massive difference between No Project and their Preferred Alternative, and thus that the immense costs, and risks, and the Plan's sharp limits on the ability of citizens to live where and how they wish, and to make decisions in their own communities as to how those communities will grow and change, are somehow justified.<sup>56</sup>

---

<sup>56</sup> These costs, and risks, and the limits on individual liberties and local decision making are not justifiable, but this is ABAG and MTC's underlying rationale.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

**Preferred Alternative and No Project –  
As MTC and ABAG Portray Them**

|                                                                              | <b>Preferred Alternative</b> | <b>No Project</b> |
|------------------------------------------------------------------------------|------------------------------|-------------------|
| Model's reported CO <sub>2</sub> emissions, 2035 (thousands of tons per day) | 108.38                       | 111.39            |

The above chart is based ABAG and MTC's own data from one of their own Model runs,<sup>57</sup> and is representative of the sorts of data that their model runs produced. This is not a chart used by ABAG and MTC to sell their Plan to the public--rather it is shown here as an illustration of the image left in the public's perception after ABAG and MTC describe the difference between their Preferred Alternative and No Project—suggesting a massive difference between the two.

<sup>57</sup> MTC Model Run 2040\_03\_78, 91, 2013 RTP/SCS CO<sub>2</sub> and Criteria Pollutant Summary Results, November 6, 2012, Appendix R.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

*What their model results really show*

However, changing the scale on the chart to their true values on ABAG and MTC's model run here (and all of their model runs were very similar) shows the true difference between No Project and their Preferred Alternative—less than a 3.00% difference, assuredly within the margin of error in their calculations here.

*But their model results reported in their analysis describe a mythical future that will not and cannot exist—and they know that, but don't tell the public*

Even more problematic, though, is that the future Bay Area portrayed in these charts above, which are directly sourced from ABAG and MTC's own model runs, is a myth which appears to have been created by ABAG and MTC to convince the public that GHG (e.g., CO<sub>2</sub>) emissions in California and the Bay Area are a dire problem that has no solution other than dramatic changes in our lifestyles, and dramatic limitations on our choices. Their implied narrative is that the only way to reduce GHGs is to reduce automobile use, or, to use their term, to reduce vehicle miles traveled (VMT). And the only way to reduce VMT is to change the way Bay Area residents live and the way Bay Area residents travel. Whether Bay Area residents want to change the way they live and travel, or not.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

However, ABAG and MTC's implied narrative assumes there is only one way to reduce GHGs from automobiles—and that is to reduce automobile use (e.g., reduce VMT). But, as a simple matter of logic, there is another way to reduce GHGs from automobiles, and that is to reduce the amount of GHGs that automobiles emit (e.g., reduce GHG per VMT). And it turns out that doing the latter is vastly easier and less expensive, and vastly less restrictive of individual choice in how Bay Area residents live and travel. And, doing so doesn't incur the extraordinary risks and uncertainties that Plan Bay Area poses to the Bay Area economy, and to Bay Area communities.

And, the regulations are already on the books. In fact, the outcomes of the Pavley 1 regulations on GHG emissions in the Bay Area have already been modeled by ABAG and MTC. However, they didn't consider the impacts of those GHG reductions in their analysis of Plan Bay Area and the draft EIR, and they haven't disclosed the results of their modeling of the GHG reductions from Pavley 1 to the public. For obvious reasons, which will become clear upon looking at a chart of the models that ABAG and MTC ran that reflected the future Bay Area as it will be, not the mythical future with no GHG reductions due to MPG regulations:

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

ABAG and MTC's model runs incorporating Pavley 1 and LCFS, that weren't incorporated in their analysis of the Plan and its alternatives, and haven't been disclosed, reflect the reality of the Bay Area's future (rather than the mythical future used to analyze the Plan

|                                                                               | Preferred Alternative | No Project |
|-------------------------------------------------------------------------------|-----------------------|------------|
| <b>Model's CO<sub>2</sub> emissions, 2035<br/>(thousands of tons per day)</b> | 108.38                | 111.39     |
| <b>CO<sub>2</sub> impact of Pavley 1+ LCFS</b>                                | 29.42                 | 30.25      |
| <b>Actual CO<sub>2</sub> results, 2035</b>                                    | 78.96                 | 81.14      |

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

There is no future world contemplated by ABAG and MTC that does not include the Pavley 1 regulations and LCFS.<sup>58</sup> So the truthful analysis that should have been presented to the public in the draft Plan and its draft EIR—and should have been used to evaluate the Plan and its alternatives—is the chart and data above, not the fabricated and mythical data that ABAG and MTC actually did present to the public.<sup>59</sup>

What the above chart shows, again, sourced solely from ABAG and MTC's model runs,<sup>60</sup> is that for ABAG and MTC's immensely expensive, immensely risky Preferred Alternative<sup>61</sup>—even assuming their models showing GHG reductions from their housing mandates and transit subsidies are accurate—the difference between No Project, and the Preferred Alternative is miniscule overall, and infinitesimal compared to the certain-to-occur CO<sub>2</sub> reductions from California regulations that are already on the books, and that ABAG and MTC have modeled the impact of.<sup>62</sup>

---

<sup>58</sup> Pavley 1, again, affects the overall MPG of the vehicle fleet sold in California from 2009 through 2016 (and forward from 2016), and the Low Carbon Fuel Regulations affect the formulation of gasoline sold in California.

<sup>59</sup> The data in the chart above, and the data in the previous charts, were all source from the same model run, *MTC Model Run 2040\_03\_78, 91, 2013 RTP/SCS CO2 and Criteria Pollutant Summary Results, November 6, 2012*, Appendix R, though the data that reflects the impact of Pavley 1 in increasing MPG (and thus reducing CO<sub>2</sub> was performed by a postprocessor application. This postprocessor application appears to have been applied to every model run.

<sup>60</sup> All model runs appear to have been roughly consistent to the one disclosed above with only minor differences in results.

<sup>61</sup> Note that all of the three other alternatives that ABAG and MTC considered in their analyses were only minor variants of the Preferred Alternative, and thus the assessment here applies to Alternatives 3, 4, and 5 as well.

<sup>62</sup> It's also worth noting in the table of data that underlies the above chart—that table immediately above the chart—that ABAG and MTC's own models show that including the impact of Pavley 1 and LCFS on CO<sub>2</sub> emissions also reduces the absolute gap that their models show between No Project and their Preferred Alternative (by almost 1/3 from a gap of 3.01 thousand tons per day in their mythical world of the future with no Pavley 1 and LCFS to 2.18 thousand tons per day in the actual world that does include Pavley 1 and LCFS).

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

Reporting the CO<sub>2</sub> results of Pavley 2 would show further, vast decreases in CO<sub>2</sub> from passenger vehicles that need to be added to the impact of Pavley 1 and LCFS.<sup>63</sup>

So, if we do nothing, already on-the-books, mandatory regulations for MPG, with the full impacts already modeled by ABAG and MTC for the first set of regulations (Pavley 1 + LCFS) and the added impacts of the second set of regulations (Pavley 2) easily estimatable, reductions in CO<sub>2</sub> by the end of the Plan's period will likely be more than 49 thousand tons of CO<sub>2</sub> per day, more than 16x the reductions claimed that will occur as a result of the Plan's housing mandates and additional transit subsidies, over No Project.<sup>64</sup>

C187-20

*Why No Project is the Superior, in fact, Only, Alternative of the Five Considered*

Adopting No Project is not “doing nothing.” It’s just not doing the fantastically expensive, unworkable policy elements that not only characterize the Preferred Alternative, but also all three other alternatives as well (as they are just minor variants of the Preferred Alternative that contain all of the Preferred Alternative’s foundational deficiencies).

Adopting No Project is simply letting people live where they want, how they want. It’s letting local cities decide how to zone as they wish. It doesn’t require the massive new regional redevelopment agencies that the Plan tells us are essential to its success. Essential to the success of the Plan, of course, because the Plan’s housing mandates will require the vast majority of all of the new high density housing units be heavily subsidized. The only high

<sup>63</sup> Assuming that Pavley 2 increases fleetwide MPG by the same 60% that Pavley 1 does, hence that Pavley 2 decreases gallons of gasoline burned per VMT as much as Pavley 1 does (the reduction in gallons of gas burned are simply a reciprocal of the increase in MPG), then just from the impact of Pavley 2 alone in 2035 would lead to another 19.34 thousand tons in CO<sub>2</sub> reductions, on top of the 30 thousand tons in CO<sub>2</sub> reductions, from the 51.92 thousand tons per day due to passenger vehicles in 2035 (Preferred Alternative calculations).

<sup>64</sup> And, since as noted in footnote 62, since the gap between the Preferred Alternative and No Project’s modeled CO<sub>2</sub> emissions narrowed by almost a third when the correct models were used, including the impacts of Pavley 1 + LCFS, also including the impact of Pavley 2 will presumably narrow the difference between the Preferred Alternative and No Project’s modeled CO<sub>2</sub> emissions even further, perhaps to 1.5 thousand tons per day.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

density housing projects that won't require substantial public subsidies are in those locations such as in the larger cities where there is already existing, market demand for high rise, high density multi family housing in downtown locations—a fact impliedly admitted to by the Plan's insistence on redevelopment agencies as necessary to subsidize its housing mandates.

C187-21

Plan Bay Area requires regional redevelopment agencies also because its high density housing mandates require large projects in suburban downtowns where much of that land already has existing uses—often small businesses serving the local community. Many of those small landowners will not want to sell and those small businesses will not want to move—so Plan Bay Area insists that it needs to have eminent domain powers to force all those landowners to sell, and all those small businesses to move, in order to build all the high density housing that ABAG and MTC insist must be built.

C187-22

The report on PDA Readiness by Economic Planning + Systems (EPS), prepared for MTC and ABAG to assess the viability of the Plan's mandate that 80% of all new housing units be built as multistory, multifamily units near mass transit in suburban and urban downtowns<sup>65</sup> unwittingly gives the public an extraordinarily illustrative and powerful window into the thinking behind Plan Bay Area. It posits a parcel of land with a small shopping center with a happy landowner who doesn't want to sell and happy tenants of that shopping center—tenants who are thriving, productive, and providing services to the local community. The value of the cash flows to the shopping center make the parcel worth \$4 million dollars—precisely because these are local businesses that are thriving, and providing services to the local community that wants those services.

Yet in MTC and ABAG's relentless drive to force unwanted housing mandates on cities, and housing in high density form for which there is only

---

<sup>65</sup> The EPS report, and the whole issue of the Plan's models, assumptions, and forecasts for market demand, are ones that I have long planned to write on in my comments. However, given the loss of time due to the inability to secure modeling related data from MTC for many weeks and the difficulties that caused in my ability to understand the Plan's analysis in those areas, I was unable to complete my work on the Plan's models, assumptions, and forecasts for high density housing in Priority Development Areas. This is one of the areas that I intend to complete work on and submit in my supplemental comments during the 30 day extension to the comment period that I am requesting in the comment letter.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

limited market demand, the EPS report posits a world under Plan Bay Area where unaccountable regional redevelopment agencies will be able to forcibly acquire that parcel of land from that happy landowner who is unwilling to sell, forcibly evict those thriving small businesses that are profitably providing products services desired and used by the local community—all in order to turn that parcel of land over to a developer that will develop housing units that will have an economic value of \$2 million. The sheer and appalling economic waste of that forced transaction, the \$2 million difference between the value of the parcel with the shopping center on it (\$4 million) and the \$2 million value of the cash flows from the housing, would be borne by the public through the subsidies provided by the regional redevelopment agency.

In most PDAs, the majority of the new development envisioned will be built within an existing urban framework, including on existing developed sites that will need to be assembled and redeveloped. This process is challenging and comparatively expensive, because the new development must yield sufficient revenue to cover not only the cost of the development but also the “opportunity cost” of retaining a use that typically is generating a positive cash flow for the existing property owner. For example, a parcel may be worth \$2 million for a new multifamily development (based on achievable building values less development costs and developer returns), and have an existing shopping center that is worth \$4 million (based on capitalized net income from the shopping center). Unless the multifamily development receives some financial assistance to make up the difference, the site is likely to remain a shopping center rather than converting to a more intensive use.

This problem is one of the key reasons the state authorized local governments to establish redevelopment agencies with broad powers to assemble land and incentivize development. The elimination of this authority in California as a means to address the state’s fiscal problems was a major blow to local government capacity to financially incentivize desired development. Without reinstatement of this authority and resources, local governments will be severely disadvantaged in tackling the problems associated with redevelopment of existing urban areas.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

EPS PDA Readiness Report, p. 38.

C187-23

*The Bay Area Citizens Transportation and Housing Alternative—the Alternative that should have been Considered and Selected*

I strongly recommend that an additional alternative be studied as part of the Plan and draft EIR, a Bay Area Citizens Transportation and Housing alternative that respects and supports the wishes and needs of Bay Area citizens in all their infinite variety and creativity, and respects their individual decision-making and desire for personal freedoms, and allows them to participate in natural, decentralized, and organically-developing human ecosystems. The Bay Area Citizens Transportation and Housing alternative consists of:

1. Expansion and improvement of existing transit systems, strongly emphasizing those modes that can be implemented quickly and with relatively low capital cost, including improvement of motor bus and vanpool services as outlined above—such as adding bus routes to make transit more accessible to lower-income residents, and adding bus capacity on heavily traveled routes. Please note that the Bay Area Citizens Transportation and Housing alternative does not consider Bay Area citizens who have lower incomes as a special interest group, but simply as valued members of our community whose personal mobility needs can be greatly enhanced, not by additional transit expenditures, but by simply redirecting existing and planned expenditures to where they have the greatest benefit to the community as a whole.
2. Major fare reductions, particularly for those types of services utilized primarily by residents with lower incomes who are dependent on public transit for their personal mobility. Consider use of transit vouchers so that fare reductions do not become a form of subsidy for inefficient public transit providers, with transit vouchers allowing the resident to select the transit provider that offers the best service for the price, thus empowering the resident, and bringing a measure of market discipline to the transit agencies.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

3. De-emphasis of expansion of expensive and low cost-effective rail transit and ferry service, using the funding saved for the other elements of this alternative, and insisting that future major transit projects provide peer reviewed analysis of environmental benefits and cost per passenger mile benefits to the project before funding proceeds, to avoid funding major projects that will not produce any public or environmental benefits at an astronomical cost to the public.
4. Studying how casual carpooling through real-time matching through portable electronic devices can be advanced to both reduce vehicle miles traveled by increasing average passenger load and provide additional transportation opportunities for the transportation-disadvantaged. It should be understood that the government role in this should be largely one of ensuring that a proper legal and regulatory structure is in place to allow innovation, while providing for safe and secure usage, is the goal – and that, to a large extent, the role of government is to get out of the way and watch it happen.
5. Encourage flexibility in local zoning so that Regional Housing Mandate Assessment allocations are able to be met in a manner that is compatible with the wishes of the local officeholders and residents of that city, takes advantage of their knowledge of and creativity in finding solutions for their own community and provides them maximum flexibility to preserve the quality and character of their town.
6. Encourage housing in all parts of the nine county Bay Area, including in the suburban and rural areas, to the extent that that housing is consistent with the local general plans and wishes of the local officials and residents in those communities. Rather than clustering people in densely packed urban and suburban downtowns, against people's expressed wishes for more disbursed and organic community growth, foster the development of local robust human and economic ecosystems throughout the Bay Area, all developed organically and naturally by the wishes and decisions of the residents themselves.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

7. Encourage expanded use of telecommuting both within the nine county Bay Area and from locations outside of the nine county Bay Area, including especially from other locations in the state that would be mutually beneficial to the cities, towns and businesses in the Bay Area, and to the Bay Area's sister cities in other counties, especially in the rural counties where many Bay Area residents would wish to live and work from if their job permitted them to telecommute from that location. Explore sister city and area locations in northern and central California's rural and exurban counties where jobs can be co-located in both the Bay Area's job center and technology and service hub, but local employment ecosystems can be established to greatly facilitate working and living in the rural or exurban area desired by the resident, while staying connected to the job center in the Bay Area. Also, establish better statistics on the currently widespread use of telecommuting by person's with jobs in the Bay Area, to understand the full benefits to those employed persons of being able to be employed in a major job center, while living somewhere else in the Bay Area, or elsewhere in California, or elsewhere in the United States.
8. Insist that before RHNA allocations are assigned to a city that the full public subsidy costs of those housing mandates are made fully transparent and require that the extent of those public subsidy costs be made a part of the decision process whether the allocation shall be permitted to placed on that city.
9. Insist that before RHNA allocations are assigned to a city that all unfunded mandates and associated costs, including the costs of subsidies, incentives, concessions, required city and school services, and property tax exemptions be fully transparent and require that the extent of those costs be made part of the decision process whether the allocation shall be permitted to be placed on that city.
10. Actions in Sacramento and Washington, DC to advocate for flexibility in transportation funding to emphasize the objective of cost-effective and productive transportation outcomes, rather than

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

designated funding sources that can only be used for specified types of capital projections.

11. Actions in Sacramento to reform those aspects of California's housing laws that have proven to be unworkable, difficult, and expensive to cities while offering limited or no benefits to the general public, while providing substantial benefits to special interests and only limited benefits to small numbers of lower income residents at an astronomical cost.
12. Focus the transportation plan and land use plan on measurable outputs such as ridership, or rider satisfaction, or cost per passenger mile (and compare different modalities) rather than on the cost of the inputs (where the measure of success is the greater the cost of the input). Do not decide, define, or describe policies in intangible terms selected for their affective response such as "smart," "sustainable," "fair share," "affordable," as these obscure and defeat open and fair public debate on important policy issues to all citizens.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

C187-24

**D. The Plan's Models Use Unreasonable and Unrealistic Assumptions that Could Only have been Selected by ABAG and MTC to Assure the Preferred Alternative Performs Better than No Project**

And, what of that paltry difference projected between No Project and the Preferred Alternative in 2040, the 3 thousand tons per day difference in CO<sub>2</sub> emitted between the two alternatives that the ABAG and MTC's models project, out of more than 100 thousand tons per day in the mythical world that ABAG and MTC appear to have created to sell the public on Plan Bay Area<sup>66</sup>? How was that difference between the Preferred Alternative and No Project actually arrived at in the Plan's models?

We know from the reports of Mr. Rubin and Mr. Silvestri, and many other comment letters that will be submitted, that none of the GHG gains from the Plan's Preferred Alternative will materialize. But assuming, for the sake of argument, that the Plan's models for the Preferred Alternative are correct, and ignoring Plan Bay Area's appalling cost and dramatic limits on Bay Area residents ability to live as they chose and travel as they wish, what about the analysis comparing the Preferred Alternative and No Project? Should we expect honest analysis here based on the practices noted above? Of course not, and that's exactly what we don't find. We find the same thumb on the scales and gearing of the results here that we find elsewhere.

The Plan itself waxes poetic about the coming dramatic shift in demand by Bay Area residents away from single family homes and toward apartments and condos in densely packed suburban downtowns. Despite the lack of empirical and analytical support for these models, easily falsifiable by the Plan's data and the data in its supporting documents, let's assume, as does the Plan's analysis, that there will be a substantial increase in market demand for high density housing in suburban and urban downtowns. And, further, let's assume that high density housing will reduce GHG emissions, and that high density housing is the only kind of housing to reduce GHG emissions—as, for the sake of argument here, we must make these assumptions because the Plan's models make these assumptions, and ABAG and MTC used their models to analyze the difference between No Project and the Preferred Alternative.

<sup>66</sup> Or the likely true difference of 1.5 thousand tons per day out of a total of 60 thousand tons of CO<sub>2</sub> per day in the actual world that will exist where the impacts of Pavley 1, LCFS, and Pavley 2 are considered

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

Under no project in the world as it exists, by definition, the cities can zone as they wish within the limits of state law, and landowners and developers can build where cities allow them to build and in the ways cities allow them to build—as long as they can make a profit doing so (e.g., as long as there is a market so those housing units can be sold at a higher price than their cost). But under “No Project,” an artificial construct created by ABAG and MTC to guarantee that their Preferred Alternative performs well in the analysis and No Project performs poorly, the models analyzing No Project disallow any new zoning changes in any of the 101 cities and towns in the Bay Area and in the unincorporated areas of the nine counties. Not even a variance is accommodated for in the modeling for No Project. Only housing units that could be built today under today’s zoning codes are allowed, and no changes in zoning are allowed for the next 30 years. Ponder, if you will, how astonishingly untethered from reality this assumption is—but the assumption appears to have served its purpose in the analysis, that of impairing the results of the analysis for No Project.

Remember, Plan Bay Area’s models assume a vast new demand for high density housing in suburban and urban downtowns. However, the mythical construct of No Project will not allow any of this to be built unless it is already zoned for today. Thus, despite this vast new demand—which is not here now, but is assumed to appear at some time in the future—these units will not get built. And, because the Plan’s models also assume that only high density housing will reduce GHG emissions, then the mythical construct of No Project, by definition, cannot reduce GHG.

C187-25

On the other hand, the Preferred Alternative is defined as allowing unlimited upzoning for cities and towns to accommodate this assumed vast new demand for high density housing in suburban and urban downtowns. And since by definition—that is, according to the Plan’s models—these high density housing units are the only housing units that reduce GHGs, and the Preferred Alternative is defined as allowing unlimited upzoning to get these units built, and No Project is defined as barring any upzoning to increase the capacity for cities to build these, by these assumptions and these assumptions alone, the Preferred Alternative will be an environmentally superior alternative and No Project will be an environmentally inferior alternative.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

C187-26

Not because one is superior or inferior to the other in fact. It's simply by definition. Before the analysis began, ABAG and MTC appear to have made sure that their Preferred Alternative would perform better on their analysis than No Project.

This gearing of the outcome by the definition of the models analyzing the alternatives was so egregious that two of the modeling professionals attending the October 2, 2012 Regional Modeling Working Group meeting (minutes attached here as Appendix S<sup>67</sup>) where ABAG and MTC's handiwork was reviewed, complained about this:

Chris and George asked about the implementation of existing general plans in UrbanSim and why zoning was changed in the Project alternative; Michael responded that the maximum zoning in city plans was used for the No Project, while upzoning was performed in the Project to support focused growth in PDAs.

---

<sup>67</sup> This was another document, and set of facts, that was were clearly disclosed in the records that MTC furnished to my colleagues and me on April 19, 2013. However, though even a cursory read of the meeting minutes caused this disclosure to jump out as troubling and material, I don't characterize this a "smoking gun" disclosure as a close and careful reading of the draft EIR enables one to puzzle out this pairing of assumptions and their impact, as well.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

## V. Other Problems with the Plan's Models and Assumptions

**C187-27** The Plan's land use and transit plans are offered by ABAG and MTC with the rationale that these plans will solve the presumed problem of climate change and GHG emissions. ABAG and MTC also suggest that their plans will foster economic growth, and is a response to the desires and needs of the cities, residents, and businesses in the Bay Area.

There are a number of problems with this narrative.

First, the Plan's models that assume locating housing next to commercial space and both next to transit stations will lead to those residents taking jobs in those businesses and both the residents and employees taking transit rather than using cars, are wrong. The Plan and the draft EIR proffer no empirical evidence to suggest that this will take place--and there is no such empirical evidence available—rather, all the available empirical evidence suggests that it will not take place.

**C187-28** Second, the Plan's policy mandate that 80% of all new housing units must be built in high density, attached multi-family units in suburban and urban downtowns near mass transit is proven to be infeasible and unworkable by ABAG and MTC's own consulting study,<sup>68</sup> that concluded that only 62% of the targeted housing units planned by Plan in these PDAs was possible during the Plan period. And this given the study's favorable study design. There appears to have been a high degree of selection bias in the 20 PDAs that were studied out of total of 169 PDAs—as these PDAs, on average, appeared to offer much more data on readiness than the other PDAs, and thus must have been more ready for development than the others.<sup>69</sup> Also,

---

<sup>68</sup> EPS Report, *PDA Readiness Assessment*.

<sup>69</sup> While EPS on the one hand appears to suggest that the 20 PDAs were representative of the entire universe of 169 PDAs,

Twenty PDAs were selected as a representative sample of the total, including a substantial proportion of the allocated housing growth but also reflecting the diversity of market and physical conditions present among the region's PDAs

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

the study did not examine the actual results (occupancy, financial returns, tax revenues) versus projections for any of the dozens of similar projects that were built with public subsidies through redevelopment agencies over the past dozen years in the Bay Area.

C187-29

Third, the Plan's assumptions that market demand will dramatically shift in the Bay Area toward high density multifamily housing from historic preferences for single family housing are without a sound analytical or empirical basis. The Plan's supporting documents themselves admit that even now 80% or more of all people who are surveyed for their preference for housing express a preference for single family housing, and one of the

---

EPS Study, p. 9, the study's conclusions back away from that implication in expressly limiting their findings to just the 20 studied, and not generalizing their findings to the universe of all 169 PDAs,

In sum, EPS has estimated that the 20 PDAs are "ready" to accommodate 62 percent of the housing growth allocated to them in *Plan Bay Area*.

Id. at 29. But any self-validating claim by the Study itself, without any data to support an inference of generalizability of its findings, would be falsified by the attached list (*PDA-List, January, 2010*, Appendix T) of Priority Development Areas by County from January 2010, more than three years ago (remembering that many of the PDAs have only been designated in the past year or two, and thus are by definition, less ready to be developed per Plan Bay Area's high density housing mandates). This January 2010 list has 114 PDAs on it, 71 of which are designated as "Planned PDAs"—presumably the more advanced and far along of the then PDAs in January of 2010. It appears as if at least fifteen of the 20 PDAs that were selected for the EPS study were among the 71 Planned PDAs in January, 2010, and at least 19 of the 20 were among the total 114 at that time—thus indicating that by definition the 20 PDAs selected for the EPS study are much more advanced and thus far more ready for high density housing development than the average PDA.

In the absence more thorough data and analysis, I would estimate that if the EPS study is correct (not a certain conclusion) that the 20 PDAs is studied can actually reasonably build 62% of the high density housing units the Plan is targeting for those 20 PDAs, that the universe of 169 PDAs overall, including the 20 studied PDAs, could only accommodate 50% or 60% of that number. Or, otherwise put, the universe of 169 PDAs, if the EPS study was generalizable and the selection bias accounted for, could accommodate 31% to 37% of the total high density housing units the Plan expects will be built in those 169 PDAs.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

Plan's own consultants on market demand, Karen Chapple admits that the Plan's assumptions for market demand are unrealistic and impractical.<sup>70</sup>

Yet, the Plan completely ignores the empirical data and admissions of its consultants in appearing to argue that while Bay Area residents believe they prefer single family homes, in actuality, they prefer to live in attached multifamily units—that is they would if they only understood how desirable these high density housing units really are. Who are we to believe? The residents themselves, who tell us what they want and need? Or ABAG and MTC who tell us something entirely different about what Bay Area residents want and need.

And, the Plan tells us that market demand will shift markedly away from single family homes towards high density attached multifamily housing due to demographic shifts, in any event. The Plan bases this on several subsidiary assumptions, including, most importantly:

- The population of senior citizens is increasing. Despite the admission of the Plan's supporting documents that senior citizens are the most likely population group to live in single family homes, the Plan nonetheless concludes that seniors will increasingly prefer to sell their single family homes and move into condominiums or apartments downtown. Is this why ABAG and MTC senior staffers have gone on the record, publicly, in stating that they believe that repeal of Proposition 13 is necessary to the success of their plan?<sup>71</sup>

Proposition 13 of course was enacted by California residents in large part to enable seniors who have lived in their homes for a long time to stay in their homes. Certainly raising property taxes by substantial amounts on seniors, many of whom have fixed incomes and who have been faced with almost no interest income on their savings accounts for many years now, will force many of them to sell their single family homes and move into apartments. Could this be the source of ABAG and MTC's confidence that in the future,

---

<sup>70</sup> "This is really a great idea, but it's just basically possible to implement," Karen Chapple, associate professor of city and regional planning at the University of California at Berkeley, *Cities Resist Regional Plan to Limit Sprawl*, SF Public Press, June 13, 2012, found at Appendix U.

<sup>71</sup> See, for example, transcript of the March 8, 2013 Joint MTC Planning and ABAG Administrative Committee meeting, attached here as Appendix V.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

seniors will increasingly sell their single family homes and move into apartments?

- The Plan posits that because the population is becoming more Asian and Hispanic, demand for high density multifamily attached housing will skyrocket because Asian and Hispanic Americans “prefer” multifamily housing over single family homes. But ABAG and MTC proffer no credible evidence to support this astonishing statement that marginalizes and purports to speak for the wishes of members of these two incredibly diverse groups of Americans—with the only possible data to support such a claim the fact that recent immigrants, who presumably are just getting established vocationally and financially in their communities, may be more likely to live in apartments rather than single family homes out of necessity. The Plan proffers no data or analysis that is controlled for length of time a resident has lived in the Bay Area, or for incomes, which would undoubtedly show that all persons of all ethnic groups have a strong preference for single family homes, if they can afford to live in one.

**C187-30** And, last, the Plan’s statements about the policy prescriptions that it believes must be enacted are particularly illuminating. The Plan, and ABAG and MTC senior staffers,<sup>72</sup> state categorically that a new regional redevelopment agency capacity is essential for the success of the Plan.

Regional redevelopment agencies will not be under the control of local cities and towns, though they will likely be funded in whole or in part by those local cities and towns and their residents. So, local land use decisions will be in great measure or wholly lost, as these new regional redevelopment agencies will make decisions about where to build new high density housing projects. This admission, alone, belies the Plan’s repeated statement that its high density housing agenda is desired and has been asked for by the cities and towns and residents themselves.

But in an even more troubling admission, the Plan and ABAG and MTC senior staffers repeatedly state that they need the government subsidies and eminent domain powers of these proposed new regional redevelopment agencies in order for the Plan to succeed. The demand for public subsidies is an express admission by the Plan that the housing and commercial developments are uneconomic, there is no market demand for the numbers

---

<sup>72</sup> Id.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

of high density housing units the Plan mandates be built, and the only way these will be built is if the public through various subsidies becomes not only the developer of last resort, but the developer of first resort. And further, the Plan expressly admits through its demand for “special tools for parcel assembly,” e.g., eminent domain powers, that the Plan will require the displacement of vast numbers of small landowners, businesses, and residents, many of whom will not want to sell their property to support the Plan’s massive development projects, and thus the Plan requires government powers to force them to sell.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

C187-31

## VI. Equal Protection and Proposition 209

Plan Bay Area relies upon assumptions about minority, ethnic populations to drive policy. We have grave concerns over whether this ethnicity-centric approach accords with the law of the state as expressed in Proposition 209, and whether it accords with the law of the land as expressed in the equal protection clause of the 14th Amendment of the United States Constitution. This Plan balkanizes and marginalizes Bay Area residents by race, when it should treat all equally.

According to the Plan, approximately one-fifth of the total Bay Area population resides in “communities of concern.” Communities of concern are defined as neighborhoods with notably high concentrations of four or more of the following: minority persons; low-income individuals; persons who are Limited English Proficient; seniors age 75 and over; persons with disabilities; households without cars; single-parent households; and renters paying more than 50 percent of household income on rent. Detailed assessments of populations by ethnicity are provided in Tables B-2 and B-3 in the Equity Analysis Appendix.

Hispanic and Asian residents are characterized culturally as having greater propensities for multi-family housing, and less propensity for single-family housing.<sup>73</sup> The Plan asserts that Hispanic and Asian residents prefer living in multigenerational arrangements which supports their demand for clustered housing units. Additionally, Hispanic and Asian residents are characterized as having larger families. Indeed, average Bay Area household size increases over the course of the Plan.

The Plan doesn’t recognize the interest in, or desire for, more private living space, such as that found in a single family home, or the desire of residents for personal, private transportation such as a passenger vehicle. In other

---

<sup>73</sup> On behalf of all citizens in the Bay Area, of all races, I am deeply offended and outraged at these assumptions embedded in Plan Bay Area. And, in addition, I am deeply incensed as the proud grandfather of a six-year-old grandson who happens to be Hispanic, the uncle of a niece and two nephews who are Hispanic as well, and the uncle of three nephews who are Asian. None of these wonderful, creative, unique human beings deserve to be marginalized and balkanized by MTC and ABAG, nor do they deserve to have their choices and decisions limited by this Plan that purports to know what these incredible young people will desire for themselves when they grow up and choose—as they will—their own destiny.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

words, the Plan infers that Hispanic and Asian residents will not assimilate into the American fabric similarly to the way other ethnic groups historically have, and yet it offers no evidence to support this astonishing claim.

The Plan also ties Environmental Justice to minority status to support policies ensure that such populations aren't subject to negative environmental conditions. Finally, in general, the Plan embodies the three principles of environment, economy and equity. These principles are not consistent with the constitutional rights that all Bay Area residents enjoy as Californians, and as Americans.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

## VI. Summary

*[Brutus] is an honourable man.  
I speak not to disprove what Brutus spoke,  
But here I am to speak what I do know.*

-- Marc Antony's Funeral Oration, *Julius Caesar* by William Shakespeare, Act 3, Scene 2, ll. 99-101

What are we to make of the above analysis which establishes conclusively that:

- C187-32 • The Plan's transit elements will not increase ridership, will not reduce GHGs, and do not include the only known transit subsidies known to increase ridership and help low income residents who depend on mass transit for personal mobility (lower fares plus service quality improvements, especially of buses).
- C187-33 • The Plan's land use elements will not decrease GHGs.
- C187-34 • According to MTC's internal model runs that haven't been disclosed to the public, the difference in GHG between their Preferred Alternative and No Project is 3.01 thousand tons per day in 2035:

|                                                                              | <b>Preferred Alternative</b> | <b>No Project</b> |
|------------------------------------------------------------------------------|------------------------------|-------------------|
| Model's reported CO <sub>2</sub> emissions, 2035 (thousands of tons per day) | 108.38                       | 111.39            |

This is an infinitesimal difference of less than 3%, well within the margin of error for a forecast for 22 years from now with massive numbers of variables considered each with uncertainties involved.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

But the model above assumes that the Plan's transit elements decrease GHG's and the model above assumes that the Plan's land use elements decrease GHG's—and both of these assumptions are falsifiable and are incorrect.

- In addition, the model runs above are based on a completely fictitious scenario that MTC and ABAG know will not and cannot happen. That is a scenario where California's Clean Car Standard regulations ("Pavley 1") do not exist. However, the Pavley 1 regulations were promulgated in 2004 pursuant to AB 1493 (2002, Pavley). The Pavley 1 regulations became effective in 2009, and govern MPG of the new passenger vehicle fleet sold in CA from 2009 through 2016 and beyond. According to MTC's own model runs, which it did not disclose to the public and did not incorporate in its analysis of CO<sub>2</sub>, Pavley 1 will increase fleetwide MPG from 20 MPG in 2010 to 32 MPG in 2035. This 60% increase in fleetwide MPG will lead, by simple arithmetic, to (1) a 37% per VMT decrease in CO<sub>2</sub> and 31.98% decrease overall factoring in increases in VMT, (2) a 37% per VMT decrease (and 31.98% overall) in particulates, and (3) a 37% decrease in gasoline burned per VMT (and 31.98% overall), which will reduce gasoline tax revenues by 31.98% in real terms by 2035, if the real, inflation adjusted price of gasoline stays the same as it is today.

However, the Plan's modeling shows a constant fleetwide MPG between 2010 and 2035 (about 20 MPG). This is how ABAG and MTC are able to forecast constant rises in CO<sub>2</sub> and hence argue that their land use plan and transit plan must be adopted to reduce CO<sub>2</sub> emissions. But ABAG and MTC know that their justification of their land use plan and transit plan is based on a mythical scenario—a scenario that they have had to fabricate in order to justify their analysis that purports to support the necessity of their land use plan and transit plan. However, since ABAG and MTC appear to want to claim credit for Pavley 1's decreases in particulates and pollutants to mitigate the adverse health impacts of their mandate that 80% of all new housing be built in congested downtowns near transit, they use a second, undisclosed, and hidden value for fleetwide MPG in their modeling to generate the desired declines in particulates and pollutants.

That is, the same model has two values for fleetwide MPG for the relevant period (from 2010 to 2035)—one for calculating CO<sub>2</sub> (20 MPG in 2010, 20

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

MPG in 2035), the disclosed MPG number—and then a second, hidden MPG number (20 MPG in 2010, 32 MPG in 2035) used to calculate particulates and pollutants. Very clever, indeed.

Here are the real CO<sub>2</sub> numbers, not the mythical ones used in the Plan's analysis:

|                                                                               | <b>Preferred Alternative</b> | <b>No Project</b> |
|-------------------------------------------------------------------------------|------------------------------|-------------------|
| <b>Model's CO<sub>2</sub> emissions, 2035<br/>(thousands of tons per day)</b> | 108.38                       | 111.39            |
| <b>CO<sub>2</sub> reductions due to<br/>Pavley 1+ LCFS</b>                    | 29.42                        | 30.25             |
| <b>Actual CO<sub>2</sub> results,<br/>2035</b>                                | 78.96                        | 81.14             |

And, the reality of what ABAG and MTC have done in analyzing their Plan is actually much worse than the above would indicate.

C187-35

ABAG and MTC defined No Project so that, by definition, it would fail compared to Preferred Alternative. The Plan assumes, against all the empirical and analytical data, vast new market demand for high density, multistory, multifamily housing in suburban and urban downtowns next to mass transit. And, the Plan assumes for the Preferred Alternative—and presumably for the other three alternatives, 3, 4, and 5 which are variants of the Preferred Alternative that assume all of its premises and are based on all the same assumptions, and thus share the Preferred Alternative's fatal flaws—unlimited upzoning by cities in their general plans. But it freezes in place current zoning in all 101 cities for No Project, in fact it doesn't even allow for the possibility of variances.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

So, since their model assumes vast unmet future market demand for high density housing next to mass transit in crowded city centers, and their models assume that this kind of housing is the only housing that decreases GHG emissions, their arbitrary and unreasonable assumption that there will not be a single change to city zoning over the next 30 years to accommodate the demand for high density housing in suburban downtowns, inevitably results in a No Project alternative that cannot reduce GHGs because it has been defined with no possibility of upzoning. Yet, the Preferred Alternative has been defined as allowing for unlimited upzoning. Even the modelers complained about this, see attached October 2, 2013 meeting of the Regional Modeling Working Group<sup>74</sup>:

Chris and George asked about the implementation of existing general plans in UrbanSim and why zoning was changed in the Project alternative; Michael responded that the maximum zoning in city plans was used for the No Project, while upzoning was performed in the Project to support focused growth in PDAs.

C187-36

- The Plan's financial analysis first "mitigates" then ignores the budget impact of Pavley 1. Since Pavley 1's fleetwide increases in MPG from 20 MPG in 2010 to 32 MPG in 2035 will lead to a 37% decrease in gasoline burned per VMT (hence a 37% decrease in gallons of gas used, and, adjusting for increases in VMT, a 31.98% decrease in gallons of gas used by passenger vehicles in 2035 over 2010), the model's assumptions of gas tax revenue are wildly over stated. The Plan's financial model assumes that gallons of gasoline sold will decline by 2.00% per year until 2020, but ignores all impact of the fleetwide MPG increases from 2020 through 2035, which will be substantial. According to MTC and ABAG's own undisclosed models, Pavley 1 will increase fleetwide MPG of passenger vehicles from 2020 through 2035 from 27.92 MPG to 32.02 MPG, a 14.68% increase that will lead to a further 12.80% decline in gallons of gasoline used per VMT by passenger vehicles during those years.

The financial model also "mitigates" the financial impact of those 2.00% per year declines in gallons of gasoline sold through 2020 by also assuming that

<sup>74</sup> Appendix S.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

the retail price of gasoline will go up 8.00% per year through 2020.<sup>75</sup> By this device, rather than seeing gas tax revenues decrease, the Plan's gas tax revenues actually increase even though actual gallons of gasoline sold decline by 2.00% per year.

In fact, the Plan's financial model assumes that the retail price of gasoline will increase by more than twice the rate of inflation over the entire Plan period (8.00% per year from 2010 through 2020, 3.3% per year from 2021 through 2035—more than twice the rate of 2.2% average annual rate of inflation overall that the Plan is based on<sup>76</sup>). This assumption is facially implausible on its face, made doubly so because MTC and ABAG's undisclosed models of the MPG impact of Pavley 1 also compelled them to model a 31.98% decline overall from 2010 to 2035 in gallons of gasoline used by passenger vehicles. However, despite their own data requiring MTC and ABAG to model this decline, MTC and ABAG have not done so, apparently because doing so would have had too adverse an impact on their budget—so they appear to have ignored it.

- The Plan's analysis completely ignores the CO<sub>2</sub> and budget impact of California's Advanced Clean Car standards ("Pavley 2"), which became fully effective in December of 2012, and govern MPG of the new passenger vehicle fleet sold from 2017 through 2025 and thereafter. While ABAG and MTC didn't model the MPG impact of Pavley 2 like they did Pavley 1 in their undisclosed models, we can reasonably assume that Pavley 2 will have approximately the same impact on MPG, hence an additional 60% increase in fleetwide MPG on top of Pavley 1's impact (so bringing fleetwide MPG up to close to 50 MPG by 2040).

Hence, Pavley 2 will lead to (1) another 37% per VMT decrease in particulates and pollutants (which would help in ABAG and MTC's justification for forcing 80% of new housing to be high density units in congested city centers), (2) another 37% per VMT decrease in CO<sub>2</sub> (which would further discredit their analysis arguing for the Preferred Alternative

---

<sup>75</sup> Appendix I.

<sup>76</sup> The Plan's underlying inflation estimate doesn't appear to be anywhere to be found in the Plan, the draft EIR, or in the supporting documents provided to the public, but was found by us in our review of documents provided pursuant to our March 13, 2013 California Public Records Act request with MTC. Appendix J.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

(or for Alternatives 3, 4 and 5 for that matter, which are simply minor variants that assume all major premises of Alternative 2), and (3) Pavley 2's additional 37% reduction in gasoline burned will have an absolutely devastating impact on the gas tax revenues that the Plan counts on for the bulk of its discretionary expenditures. Pavley 1 and Pavley 2 will obliterate the Plan's budget--which is presumably why ABAG and MTC's financial models "mitigated" part of Pavley 1's impact with assumptions about offsetting gasoline price increases, then ignored the rest of Pavley 1's impact, and ignored Pavley 2's budgetary impact entirely.

The Plan's financial model has all the integrity of reporting to the SEC or the IRS a financial statement that includes all expenditures but omits all revenues. Alternatively, it has all the integrity of seeking investment capital from equity investors or a loan from a bank by providing a financial model that has all the revenues and none of the expenditures.

What MTC and ABAG are doing here by using one MPG number in their model to produce their CO<sub>2</sub> numbers--this is the disclosed MPG number, in order to report high CO<sub>2</sub> numbers--then an entirely different MPG number, hidden deep inside the model and not disclosed, in the same model to produce their particulate and pollutant results in order to report declines in those particulates and pollutants, is the same as if the same entity was reporting to the SEC and IRS as per above, while at the same time seeking investment capital or bank loans as per above.

**C187-37** This is all before considering the Plan's vast underfunding of maintenance of local streets and roads and another dozen or two egregious and disingenuous elements in the Plan and its analysis.

ABAG and MTC, and their closely aligned non-governmental organizations (NGOs) and powerful political and financial supporters assure us that ABAG and MTC are honourable agencies, and their actions only seek to do good. But if an individual citizen, or a business organization or nonprofit were to engage in the above manipulation of analysis and results, the individual, or the organization's principals, would more likely be looking at a 20 year residency in one of state of California's high density housing facilities—those where residents are not permitted to leave for the duration of their sentence—for their actions, rather than receiving the huzzahs and praise of supporters.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

What are we to make of all this? How should we characterize ABAG and MTC's manipulation of the models and the results in order to get their Preferred Alternative adopted?

Let's first look at how ABAG and MTC characterize their analysis, and their Plan. They call it "smart" and "sustainable." How does the dictionary define these terms?

According to dictionary.com,<sup>77</sup> "smart" is defined as, alternatively:

2. to be the cause of a sharp, stinging pain, as an irritating application, a blow, etc.
3. to feel a sharp, stinging pain, as in a wound.
- ...
6. to cause a sharp pain to or in.

or,

7. quick or prompt in action, as persons.
8. having or showing quick intelligence or ready mental capability

The term "smart" is actually a marvelously clever use of language. It impliedly discloses to the public on the one hand, how the public will experience the mandates and impacts of the Plan's policy elements, in the primary definition noted above, "to be the cause of a sharp, stinging pain, as an irritating application, a blow," and this describes the impact of the Plan on the public to a "t." But the language used also cleverly imports the alternative meaning of the term "smart"—that being "having or showing quick intelligence or ready mental capacity." This alternative meaning of the term "smart" elicits in the listener a positive emotional affect, as in, "I don't know what 'smart growth' is, but I know that I like it because the way it makes me feel when I hear the term. I'm sure I don't want what 'smart growth' is not, because that must be 'dumb growth.'"

---

<sup>77</sup> *smart definition, dictionary.com, Appendix W.*

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

But though “smart” is used often to describe the Plan, the flagship characterization used by ABAG and MTC is indisputably “sustainable.” Thus, it is the definition of “sustainable” that we must look to, to understand how ABAG and MTC themselves characterize their Plan, and their analysis.

The dictionary does not disappoint. According to dictionary.com,<sup>78</sup> “sustainable” is defined as:

1. capable of being supported or upheld, as by having its weight borne from below.
2. pertaining to a system that maintains its own viability by using techniques that allow for continual reuse: sustainable agriculture. . . .
3. able to be maintained or kept going, as an action or process: . . .
4. able to be confirmed or upheld: a sustainable decision.
5. able to be supported as with the basic necessities or sufficient funds: a sustainable life.

This is exactly what ABAG and MTC are asking the public to believe about their Plan and their analysis. That it is “capable of being supported or upheld,” it represents “a system that maintains its own viability,” “is able to be maintained or kept going,” “is able to be supported as with . . . sufficient funds.”

However, are these definitions of “sustainable” a fair characterization of the Plan and its analysis? As we’ve noted above, the Plan is a land use plan that does not reduce GHGs, and it is a transit plan that will not reduce GHGs. Nor will the transit plan increase ridership, nor does it adopt the only known strategies that will actually increase ridership and help lower income residents who are dependent on mass transit for personal mobility (and will do so cost effectively). Thus, the Plan will not do anything that it says it will do, and yet its policy elements come at an astronomical cost, tremendous risks, leads to significant limitations on the choices of individual residents and businesses to live or locate where and how they wish, and dramatically

---

<sup>78</sup> *sustainable definition, dictionary.com, Appendix X.*

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

erodes the ability of local jurisdictions to decide for themselves how they will change and grow.

Further, the Plan has been justified to the public with models that incorporate the impacts of California MPG regulations to show dramatically decreased particulates and pollutants in order to show that the Plan's mandate that 80% of all new housing be built in high density multistory multifamily units near mass transit in suburban and urban downtowns looks better, because the adverse health impacts of those housing mandates are substantially lessened by the declining amounts of particulates and pollutants due to those increases in fleetwide MPG. But at the same time, the Plan completely ignores the impact of those same MPG regulations on that same exhaust stream from that same vehicle, on reducing CO<sub>2</sub> emissions. And the Plan ignores that impact because incorporating those inevitable and certain CO<sub>2</sub> reductions, which are many orders of magnitude greater than the speculative and uncertain<sup>79</sup> reductions in CO<sub>2</sub> from the Plan's transit and land use elements would render the Plan's justifications completely untenable, and make obvious that the Plan's costs and limitations on individuals, businesses, and cities are unnecessary and tragic. Which appears to be precisely why ABAG and MTC, though they performed this analysis of these regulations on CO<sub>2</sub> in their modeling work, nonetheless declined to disclose the results of that analysis to the public.

This is also a Plan that has been justified by arbitrarily defining No Project as disallowing any local zoning changes over the next 30 years, in order that No Project, by definition, performs more poorly than the Preferred Alternative, which is defined as allowing unlimited upzoning in local general plans. Is this analysis "sustainable" in the sense that it is fairly characterizes "a system that maintains its own viability," or "is able to be maintained or kept going"?

And does a Plan whose budgetary justification relies solely on its decision to ignore the massive budgetary impact of two sets of California regulations governing MPG that will, successively, reduce gallons of gas sold by first 31.98%, then by another 32% or so on top of the first reduction—a Plan that when in those first few years where the impact cannot be completely ignored, "mitigates" the impact of lowered gallons of gasoline sold by assuming exceptionally high annual increases in the retail price per gallon of

---

<sup>79</sup> Actually, certain not to occur.

Peter Singleton, Bay Area Citizens, Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report

gasoline for those years? Is this “sustainable” in the sense that it “is able to be supported as with . . . sufficient funds”?

Finding ABAG and MTC’s own characterization of its Plan and its analysis justifying the Plan as lacking support as noted above, we must continue to look through the dictionary to see if there is a more apt or accurate characterization for the Plan, and for the analysis that ABAG and MTC have proffered to the public in justification for its stated firm intention to certify the final EIR and adopt this Plan on July 18, 2013.<sup>80</sup>

I offer the following terms, and definitions, in this comment letter as a possible alternative characterization of the Plan and the analysis that ABAG and MTC have used to justify their intended and certain certification of the final EIR and adoption of the Plan on July 18. These certainly aren’t the only possible alternative characterizations—I simply offer them here for the purposes of discussion and to contribute to the public debate.

C187-39

However, I do request here, as this is a comment submitted regarding the draft Plan and draft EIR, that ABAG and MTC respond with specifics as to why they consider that their characterization of the Plan and their analysis used to justify the Plan as “sustainable” accords with the dictionary definitions of that term in the light of the undisputed data and the

---

<sup>80</sup> Note that ABAG and MTC’s stated intention to certify the final EIR and adopt the Plan on July 18, 2013 is further confirmation, if we needed any, that the entire public input process, and CEQA review, has been a sham. ABAG and MTC have left no time in the process to make substantive modifications to the Plan to respond to the public’s comments. This is an implied, though certain, admission that ABAG and MTC do not intend, and have never intended to consider any substantive comments that require the Plan or its analysis to be modified in any meaningful manner.

Yet it is precisely the possibility that the Plan or its analysis will need to be modified in a meaningful manner that the legislature established the CEQA review process in the first place, and that other state and federal statutes require public input and review of the Plan itself. Lead agencies stating, in effect, that there is no possibility and there are no circumstances under which they will modify their Plan or its analysis in a meaningful manner—e.g., in a manner that would require a delay in their schedule--in responding to public comment on the Plan and the draft EIR makes a mockery of the legislative intent behind these mandated public input processes.

unassailable analysis offered in this comment letter and in its attachments.<sup>81</sup> I also, specifically request ABAG and MTC to respond with specifics why the following alternative possible characterizations are not a more accurate description of the Plan and of ABAG and MTC's analysis used to justify the Plan. And, actually, perhaps the most honest and honourable action that ABAG and MTC can take in response would be simply to acknowledge that their Plan and the analysis they have used to justify it are not "sustainable," and rather, have significant deficiencies that are more accurately characterized with terms more similar to those below.

Returning again to the dictionary, I considered the following definition of "fraudulent":<sup>82</sup>

1. characterized by, involving, or proceeding from fraud, as actions, enterprise, methods, or gains: a fraudulent scheme to evade taxes.
2. given to or using fraud, as a person; cheating; dishonest.

Clearly, the term "fraudulent" is much more apt and accurate in characterizing the Plan and ABAG and MTC's analysis used to justify the Plan than the term "sustainable" that ABAG and MTC have used. However, we need a bit more information. The meaning of "fraudulent" depends on the meaning of "fraud." How does the dictionary define "fraud"?

And, here, we appear to hit pay dirt. According to dictionary.com,<sup>83</sup> "fraud" is defined as:

1. deceit, trickery, sharp practice, or breach of confidence, perpetrated for profit or to gain some unfair or dishonest advantage.
2. a particular instance of such deceit or trickery: mail fraud; election frauds.

---

<sup>81</sup> And in other comment letters that provide similarly compelling data and analysis regarding the flaws of the Plan and of ABAG and MTC's analysis.

<sup>82</sup> *fraudulent definition, dictionary.com, Appendix Y.*

<sup>83</sup> *fraud definition, dictionary.com, Appendix Y.*

3. any deception, trickery, or humbug: That diet book is a fraud and a waste of time.

And what about synonyms of the term “fraud” such as “deceit”?<sup>84</sup>

1. the act or practice of deceiving; concealment or distortion of the truth for the purpose of misleading; duplicity; fraud; cheating: Once she exposed their deceit, no one ever trusted them again.

2. an act or device intended to deceive; trick; stratagem.

Again, a much closer fit here as well, than ABAG and MTC’s own characterization of “sustainable.”

ABAG and MTC are honourable agencies—at least they assure us that they are, and their closely aligned NGOs and powerful political and financial supporters claim they are as well. However, given the radical disconnect between ABAG and MTC’s own characterization of their Plan and their analysis used to justify the Plan—a more inapt or more inaccurate characterization cannot be found than “sustainable.” Given the seemingly close fit of the above suggested characterizations, “fraudulent,” “fraud,” and “deceit,” I hereby request in this comment a response by ABAG and MTC that either

C187-40

(1) purports to show, despite the above, that their characterization of “sustainable” is nonetheless accurate and apt, and purports to show, despite the above, that an alternative characterization of “fraudulent,” “fraud,” or “deceit” is not accurate and apt, or

(2) does the honourable thing and admits that “sustainable” is not an accurate or apt characterization of their Plan and the analysis they have used to justify the Plan, and that an alternative characterization such as “fraudulent,” “fraud,” or “deceit” would be a more accurate and apt characterization.

**RE: Comments on Plan Bay Area / Draft Environmental Report**

Ms. Worth and Mr. Luce:

This letter accompanies my comments on the Plan Bay Area and the Draft Environmental Impact Report. In the short period allotted for public comment, I limited my comments predominantly to the DEIR chapter/section 2.5 "Climate Change and Greenhouse Gases", albeit there is also commentary on a few issues outside that particular chapter/section. Exhibits are referenced within my document and are to be found at the end of the document text.

Since I have gone to some length to describe where and why I have found the DEIR and Plan's assertions and policies to be sometimes deficient, often inaccurate and disturbingly misleading, I request that full review be given to the content presented herewith and hold an expectation that the material will be responded to substantively.

Sincerely,

*15/ Rebecca LaPedus*  
Rebecca LaPedus

## Comments on April 2013 Draft Environmental Report (DEIR) for Plan Bay Area

### State Clearing House Number 2012062029

Page 423, Part Two, 2.5 section title, "Climate Change and Greenhouse Gases", is the subject upon which my comments herein will largely but not entirely focus. There are a number of stated assumptions within this section that run contrary to scientific *research* and, importantly, relevant scientific *data* is curiously missing from this section's content. Such *errors* and *discrepancies* render misleading and deficient conclusions.

The third paragraph of very first sentence asserts, "Global climate change (GCC) poses an *immediate* threat to the Bay Area's economy, environment, and public health" (italics added). I can find no evidence that GCC - in whatever that change may consist - has happened in an instantaneous fashion. Indeed, further down the same page, the Report states, "Over the last 10,000 years, the rate of temperature change has typically been incremental, with warming and cooling occurring over the course of thousands of years". The graph below indicates precisely that.

1 The sentence following then selectively refers to the past 150 years to  
 2 indicate that an increase in warming is *unprecedented*.<sup>1</sup> Using a small  
 3 data set to prove a theory is not sound science and must only be used  
 4 in context with larger data sets to reveal patterns. Exhibit A shows both  
 5 short & long term graphs that provide a perspective on temperature  
 6 fluctuations within different periods to demonstrate reoccurring  
 7 oscillations.

8 But even if one chose to use the small data set of the past 150 years,  
 9 the claims for that data must reflect correct information. Section 2.5 -1,  
 10 page 423 asserts that an unprecedented increase in the rate of warming  
 11 occurred over the past 150 years, roughly coinciding with the global  
 12 industrial revolution . . .” (Underscoring added) But industrial  
 13 production in the early decades of the 20<sup>th</sup> century was still in its infancy  
 14 and restricted to a few European countries. And these countries were  
 15 handicapped by war and economic depression. It wasn’t until the time  
 16 *following* the second world war that consumer goods began to be  
 17 massed produced for an international market. If one examines the  
 18 temperature records with the industrial timeline, from the mid-19<sup>th</sup>  
 19 century forward, the earth’s temperature was rising. But most of the  
 20 temperature rise took place before the 1940’s when industrial  
 21 production was relatively insignificant. Following the war, GDP rose  
 22 and demand for products grew. There was rapid industrial development  
 23 and cars took the road and planes to the sky in increasing numbers.  
 24 Just when one might expect a temperature rise for the increase in  
 25 manufacturing, commercial farming, garment factories, etc.,  
 26 temperatures fell for four decades. It is during this period. that

---

<sup>1</sup> ~ 150 years is what is available to us in instrumental temperature records kept in weather stations and aboard ships. But these records, while useful in conjunction with other records, contain inconsistencies and were never intended to provide a climatic record.

1 environmental extremists began predicting a coming ice age. It wasn't  
2 until the 1970s, during an economic recession, that temperatures again  
3 saw a temperature rise.

4 \_\_\_\_\_

5 Multiple perspectives on the *causes* of GCC would demonstrate the  
6 most reliable direction or trends of GCC, provided those contributions  
7 are not generalized into biased conclusions. The DEIR heavily depends  
8 for its GCC computer data upon the United Nations Intergovernmental  
9 Panel on Climate Change (IPCC),<sup>2</sup> which has received substantial  
10 criticism for its paradigmatic approach to explanations for climate  
11 change. There is some good science around the peripheries of the  
12 IPCC reports, but largely, the IPCC uses computer models to  
13 synthesize input and its consequent forecasting trends, trends in global  
14 warming that have already proved inaccurate against actual  
15 declinations in global temperatures. Political influence on the IPCC has  
16 been documented, and the UK House of Lords Select Committee on  
17 Economic Affairs stated: "We have some concerns about the objectivity  
18 of the IPCC process, with some of its emissions scenarios and  
19 summary documentation apparently influenced by political  
20 considerations. There are significant doubts about some aspects of the  
21 IPCC's emissions scenario exercise, in particular, the high emissions  
22 scenarios."<sup>3</sup> And quoting from the same Committee, "The Government  
23 should press the IPCC for better estimates of the monetary costs of  
24 global warming damage and for explicit monetary comparisons between

C188-2

<sup>2</sup> Such is also the case with the ARB and the EPA, frequently cited in other sections of the DEIR. The ARB also uses the IPCC for the California Greenhouse Gas Inventories for global warming potentials.

<sup>3</sup> The DEIR uses 3 of the IPCC scenarios on Page 430, Section 2.5-8

the costs of measures to control warming and their benefits.”<sup>4</sup> In February 2010, in response to mounting controversies regarding claims in the IPCC’s 2007 Fourth Assessment Report, scientists who had actually contributed to IPCC reports called for changes to the IPCC. The following March, the InterAcademy Council (IAC) made a number of recommendations, including:

“[E]ncourage review editors to ensure that all reviewer comments are adequately considered and genuine controversies are adequately reflected in the assessment reports”; and “Quantitative probabilities (as in the *likelihood* scale) should be used to describe the probability of well-defined outcomes only when there is sufficient evidence”.<sup>5</sup> and <sup>6</sup> (italics added) These recommendations are not unlike Section 15151 of the CEQA Guidelines, which governs the Standards for Adequacy of an EIR.

“... the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure.”

On 2.5-3 page 426, the DEIR identifies six GHGs that the EPA listed as the most threatening due to their *global warming* potential (GWP) and on the following page, it states:

“Gases with a higher [global warming potential] (GWP) absorb more energy per pound than gases with a lower GWP, and thus contribute more to *warming* Earth.” and

<sup>4</sup> I could find no cost/benefit analysis in the DEIR within the time framed allowed for public comment. Review of the March Financial Assumptions only listed estimated Revenues. Coincidentally, the Grand Total for those revenues exactly match the Plan’s estimated total cost of the Plan, the latter of which is not detailed. This tests the credulity of the numbers when listed revenues and total cost both balance perfectly.

<sup>5</sup> See DEIR, Page 424, 2.5-2 for usage of IPCC’s “likely” bullet points.

<sup>6</sup> The next (5<sup>th</sup>) IPCC Report is scheduled for release in 2014. Wikipedia

1 “GWP is alternatively described as ‘carbon dioxide  
2 equivalents’, or CO<sub>2e</sub>” (Italics added)

3 The DEIR shows that CO<sub>2</sub> has the GWP of 1 vs. much higher GWPs for  
4 other GHGs. Therefore, CO<sub>2</sub> is clearly not a potent greenhouse gas by  
5 comparison. One can only assume the DEIR focuses on CO<sub>2</sub>, on the  
6 basis of its percentage when compared to the other GHGs listed, which  
7 will be treated later in this commentary on page 10. Nonetheless, the  
8 science of CO<sub>2</sub>’s GWP and, hence, its actual threat to the public’s  
9 welfare is not as verifiable as we are led to believe in the DEIR, and any  
10 reading of studies on this subject demonstrates that there certainly is  
11 not “consensus” by scientists as the DEIR so assuredly quotes the  
12 IPCC in 2.5-2 on page 424. Nonetheless, it is CO<sub>2</sub> (and/or CO<sub>2e</sub>)  
13 emission reduction that drives the Plan and the DEIR per AB 32.

---

14  
15 One of the ignored influences on climate change is the Pacific Decadal  
16 and Atlantic Multidecadal Oscillation cycles (PDO & AMO respectively).  
17 This 25-30 year cycle indicates a sinking and rising movement with cold  
18 ocean waters below replacing warm ocean waters above and then  
19 reversing that flow. The PDO (and similarly the AMO) was, not  
20 coincidentally, in tandem with the change in temperatures in the 1940’s  
21 to the late 1970s, when temperatures dropped steadily. However, when  
22 the warmth of the PDO and AMO coincide, the atmosphere warms.  
23 This explains the rise in temperature beginning in 1970. In 2000, the  
24 IPCC forecasted a rise by 1°C by 2010, ignoring the fact that in 1999,  
25 the PDO had turned cold causing instead a *drop* greater than 1 degree  
26 in global temperatures. This is what comes of using computer models  
27 that assume that a current or previous condition, e.g. a period of  
28 warming, is the effect of some sole agency, e.g. CO<sub>2</sub>, rather than  
29 warming being the very *cause* of an increase in CO<sub>2</sub>. Howard Hayden,

C188-4

1 Professor of Physics (Emeritus) at the University of Connecticut <sup>7</sup>,  
 2 states in his 2009 letter to the EPA - another governmental body, which  
 3 the DEIR frequently references - that "The first principle of causality is  
 4 that the cause has to come before the effect. The historical record  
 5 shows that climate changes precede CO<sub>2</sub> changes." The complete  
 6 letter is contained in Exhibit B. Supporting this principle, Canadian  
 7 Astrophysicist and climate analyst, Joseph E. Postma <sup>8</sup> posits:  
 8 "Thousands of years of proxy data proving increases in levels of  
 9 atmospheric carbon dioxide are proven to *follow*, not cause, all prior  
 10 increases in global temperatures." (Italics added) During the cycles of  
 11 the last four glacial periods, temperature changes *always preceded*  
 12 changes in atmospheric CO<sub>2</sub> levels. Likewise, CO<sub>2</sub> level decline begins  
 13 after temperature has dropped. 700,000 years of this pattern cannot be  
 14 discounted. That is not to suggest that this pattern is perfectly smooth.  
 15 The Medieval period experienced a 300-year period of warming;  
 16 however, that period cannot possibly constitute anthropogenically  
 17 caused CO<sub>2</sub> levels,

---

19 Attending to the possible multiple *causes* that may influence GCC  
 20 cannot be limited to those factors that best support the DEIR's adopted  
 21 IPCC & EPA positions on GCC. Sound climate science demands that a  
 22 postulation of anthropogenic influences on GCC must, *pari passu*,  
 23 include whatever data might unseat the theory. Exemptions of those  
 24 studies that contradict that anthropogenic CO<sub>2</sub> is the driving factor that

---

<sup>7</sup> Howard Hayden's research interests include ionic and atomic collisions, charge transfer, ionization, energy loss, energy-level crossings, ion-surface collisions, ion implantation, relativity considerations and energy for society (fossil fuels, nuclear, hydro, wind, biomass, photovoltaics, solar heating). He is the author of *A Primer on CO<sub>2</sub> and Climate*, among other publications.

<sup>8</sup> Joseph Postma: M.Sc. astrophysics. Played a central role in the design, management & coordination of the development of a space-based instrument package (Ultra Violet Imaging Telescope).

1 is causing an “irrevocable shift”<sup>9</sup> in weather related patterns is not  
 2 sound scientific analysis. The IPCC and EPA seem plagued with an  
 3 inability to consider the distinction between what their models observe  
 4 (the “what”) from the controlling agent (the “why”). The debate cannot  
 5 be based entirely on whether warming/cooling and up/down of CO<sub>2</sub> are  
 6 correlative but rather which is driving which. There is no compelling  
 7 evidence that CO<sub>2</sub> has ever driven the climate in the past or is doing so  
 8 now. According to global warming theory, if increased CO<sub>2</sub> results in a  
 9 rise of GHGs and hence, warming, then the rate of temperature rise  
 10 should be greatest in that part of the earth’s atmosphere known as the  
 11 troposphere (tropics).<sup>10</sup> Nevertheless, satellites show the contrary.

12 If we return to the earlier discussion of the PDO/AMO oscillations, study  
 13 after study confirms that the oceans are the dominant source and sink  
 14 for CO<sub>2</sub>. Water - as a gas, not a condensate or cloud - is the major  
 15 radiative absorbing-emitting gas in the atmosphere, not CO<sub>2</sub>. As with  
 16 the *oscillations* of the PDO/AMO, the tripping point of temperature  
 17 extremes coincides with the opening and closing oscillations of the ice  
 18 cap in northern polar regions. It is important to note that the ice cap  
 19 developed and then expanded because the Arctic Ocean supplies the  
 20 cap’s moisture (not a conjecture). The cap’s expansion or shrinkage  
 21 depends upon whether the Arctic Ocean is frozen over or not. It  
 22 currently is frozen over, meaning that it does not provide the moisture  
 23 necessary for the cap’s expansion and hence, its shrinkage. And  
 24 consequently, the earth’s absorption of radiation from the sun increases  
 25 and voila! warming. At this time, oceanographic reporting shows that  
 26 with this warming of temperature, the Arctic Ocean thaws (not  
 27 completely, of course) and once again supplies moisture to the cap for

<sup>9</sup> DEIR page 423, 2.5, Paragraph 3

<sup>10</sup> John R. Chirsty: “Tropospheric Temperature Change Since 1979 from Tropical Radiosonde and Satellite Measurements” Journal of Geophysical Research, Vol 109

1 its expansion. Recent oceanographic reports suggest that such  
2 reversal has begun and we can expect a gradual cooling period, some  
3 of which we are already experiencing.

4 To remain in the icecap subject a bit longer, the arctic icecap ice melt is  
5 the most frequently referenced in claims for the detrimental effects of  
6 greenhouse gases (GHG). But the antarctic icecap contains about 90%  
7 of the earth's ice. While the arctic icecap reached 30-year lows in 2007  
8 and again in 2012, satellite images indicate that antarctic sea ice has  
9 been expanding for the last 30 years. (Could this be partly due to the  
10 shift in the earth's magnetic field?)

11 Greenland holds about 8% - 9% of earth's ice. Data shows Greenland's  
12 surface temperature was warmer in the 1930's and 1940's than the  
13 present day. Many are familiar with the story of the "Glacier Girl"  
14 squadron that crashed in Greenland in 1942. The crew was eventually  
15 rescued, but the Allies were forced to abandon the wrecked planes,  
16 unable to retrieve them as they slowly disappeared under drifting snow.  
17 In 1988, exploration for the crashed planes began. Forty-six years  
18 since the planes had crash-landed, "an astonishing 268 feet of ice had  
19 accumulated over them". In 1992 a rig called the "Super Gopher" finally  
20 retrieved pieces of a P-38. It took the better part of a month for the  
21 gopher to chew its way to the bounty.<sup>11</sup> One wonders where so-called  
22 "... scientists have observed an unprecedented increase of warming  
23 over the past 150 years".<sup>12</sup> (Italics added)

24 Swimming in ocean waters for just a bit longer, Argo is a global array of  
25 3,500 floating robot sensors that descend to 6,562 feet and then rise to  
26 the surface. They record up to 1,000 measurements of temperature,  
27 salinity and other key parameters. When the probes resurface, they

---

<sup>11</sup> "Exhuming the Glacier Girl" by Alan Bellows

<sup>12</sup> DEIR, Page 423, Section 2.5

1 beam the data up to satellites.<sup>13</sup> Since full deployment of the system,  
 2 the ocean heat content has declined, irrespective of any rise in GHGs.  
 3 While radiation from the sun does penetrate the surface of ocean  
 4 waters causing heat, this is a relatively stable process and not  
 5 (obviously) anthropogenically caused. However, the long-wave infrared  
 6 radiation (LWIR) from GHG's can only penetrate a few microns past the  
 7 water's surface, causing evaporation and consequently cooling. Roy  
 8 Clark, PhD explains that "It is impossible for a 1.7 W.m<sup>2</sup> increase  
 9 [predicted by the IPCC due to man-made greenhouse gases] in  
 10 downward 'clear sky' atmospheric LWIR flux to heat the oceans." This,  
 11 of course, goes back to the earlier question this comment paper raised  
 12 re *what* drives *what*. The probes indicate that GHGs cause increased  
 13 evaporation and ocean surface cooling, and the sequence of global  
 14 temperature change is from the ocean surface to land to the lower  
 15 troposphere.<sup>14</sup>

16 There are a number of studies and stubborn scientific facts that  
 17 contradict the stance taken by the Plan and DEIR, not the least of which  
 18 is that, as mentioned heretofore, the IPCC computer models are  
 19 meeting with failure in IPCC forecasts. Another fact is that global  
 20 cooling has taken over for sixteen years now, and less warming than

---

<sup>13</sup> From NOPP article by Will Ramos, February 20, 2013

<sup>14</sup> "An important new paper published in Global and Planetary Change finds that changes in CO<sub>2</sub> follow rather than lead global air surface temperature and that CO<sub>2</sub> released from use of fossil fuels have little influence on the observed changes in the amount of atmospheric CO<sub>2</sub>. The paper finds the overall global temperature change sequence of events appears to be from 1) the ocean surface to 2) the land surface to 3) the lower troposphere; in other words, the opposite of claims by global warming alarmists that CO<sub>2</sub> in the atmosphere drives land and ocean temperatures. Instead, just as in the ice cores, CO<sub>2</sub> levels are found to have a lagging effect in ocean warming and not significantly related to man-made emissions, and not the driver of warming. Prior research has shown only shortwave radiation from the Sun is capable of penetrating and heating the oceans and thereby driving global surface temperatures." Anthony Watts, August 30, 2012 WUWT

the forecasted warming of the IPCC has occurred over the last 22 years, with 30,000 stations around the world finding that the earth stopped warming in 1997. It is a source of much confusion in reading the DEIR whether its reduction in GHGs is driven by *warming* or *climate change* - cool or warm - since the content refers to both interchangeably. Is it warming or the asserted prevalence of "extreme weather" in certain regions that demands reduction of CO<sub>2</sub>?

Water vapor, a GHG that the Plan & DEIR inexplicably dismisses from discussion, comprises approximately 90% - 95% of the greenhouse gases. CO<sub>2</sub> is no more than 4%. Of that 4%, a little more than 3% is anthropogenic. 3% of 4% = 0.12% of GHGs in the atmosphere.

Exhibit C displays a chart that provides a perspective of the relationship of CO<sub>2</sub>, including man-made CO<sub>2</sub>, to other GHGs.

The bulk = water vapor ~95% (green dots);  
Nitrous oxide, methane, misc. make up 1.4% (yellow);  
Carbon dioxide divided into natural 3.48% (grey) and  
anthropogenic .0.12% (black).

Other GHGs, excluding CFCs, HCFCs PFCs and SF<sub>6</sub>, are also mostly of natural origin. Human activities, as the DEIR points out, contribute to GHGs through farming, manufacturing power generation, and transportation. However, these emissions are so dwarfed in comparison to those from natural sources, that costly efforts at reduction would have an infinitesimal effect on climate.

The ARB's GHG reduction targets (by years 2020 and 2035) that SB 375 authorized and which the MTC & ABAG incorporated into the

C188-5

C188-6

1 Plan & DEIR for CO<sub>2</sub> vehicle emissions are stated as being 7% and  
 2 15% respectively. A 15% reduction in man-made CO<sub>2</sub> results in a  
 3 0.00018 reduction (.0012 x .15) of CO<sub>2</sub> in the atmosphere. How can the  
 4 Plan's overly ambitious strategies to comply with AB 32 be justified by  
 5 this insignificant reduction?

6 AB 32's first page states:

7 "The bill would require the state board to adopt rules and  
 8 regulations in an open public process to achieve the maximum  
 9 technologically feasible and cost-effective greenhouse gas  
 10 emission reductions, as specified." (underscoring added)

11 Even the Contra Costa Transportation Authority balked at Plan Bay  
 12 Area estimates, citing very little reduction on GHGs from land-use  
 13 strategies. That was further supported by ABAG President, Mark Luce,  
 14 who stated, "We're not going to move the greenhouse gas numbers  
 15 substantially with this Plan . . . anyone who says that we are is  
 16 dreaming."<sup>15</sup>

17 \_\_\_\_\_  
 18 Another aspect of temperature change is consideration of the equator to  
 19 pole temperature gradient (EPTG) because major climate changes in  
 20 the past correlate with large changes in equator to pole temperature  
 21 differences and relatively constant equatorial temperature. Changes in  
 22 the mean temperature of the earth appear to have been a by-product of  
 23 these changes rather than a *cause*.<sup>16</sup> There is an absence of empirical  
 24 data contesting this proposition. What controls the equator to pole  
 25 temperature distribution of the earth's surface is a very efficient system  
 26 to transfer energy from the equator to the north pole causing it to warm.  
 27 This has large implications for CO<sub>2</sub> and temperature rise theories. The

C188-7

<sup>15</sup> Video of ABAG Board meeting: March 9, 2012 available upon request

<sup>16</sup> Richard Lindzen: Annual Review of Fluid Mechanics

- 1 image on the next page better lends a quick view of how this complex
- 2 mechanism works than would a lengthy description in text.
- 3 (Remainder of this page intentionally left blank.)

1

1 EPTG cannot be divorced from the influence of the sun on temperature  
2 fluctuations. Why the activity of the sun and its impact on climate  
3 change is so infrequently addressed (as is the case with the DEIR) is a  
4 curiosity. Scientists have been exploring and keeping detailed records  
5 of the influence of the sun on climate for centuries. The chart on the  
6 following page shows the relationship between solar radiation and  
7 daytime high temperatures. This relationship suggests that the way sun  
8 cools and warms the earth is through the penetration of incoming solar  
9 radiation. Recent work by the National Center for Atmospheric  
10 Research's Gerald Meehl and Harry van Loon stated that even small  
11 changes in solar radiation can seriously effect earth's temperature.  
12 "The close relationships between the abrupt ups and downs of solar  
13 activity and of temperature that we have identified occur locally in  
14 coastal Greenland, regionally in the Arctic Pacific and North Atlantic,  
15 and hemispherically for the whole circum-Arctic, suggesting that  
16 changes in solar radiation drive temperature variations in at least many  
17 areas." And "Pictures like these cannot be drawn for temperature and  
18 CO<sub>2</sub> concentration. There just is no such *close match* between the  
19 steady rise in atmospheric CO<sub>2</sub> concentration and the often dramatic  
20 ups and downs of surface temperatures in and around the Arctic, China  
21 and the United States." (italics added)

22

The sun and climate correlations that were studied also demonstrated the ETPG link to total solar irradiance, as briefly touched upon heretofore, and validates that the Plan's & DEIR premise that CO<sub>2</sub> drives climate change is a distortion. At the moment, we are in a phase of low sunspot activity, which parallels with colder temperatures. This pattern was seen during a period called the Dalton Minimum (1790 - 1830). A period known as the Maunder Minimum (1645 - 1715) saw ~50 sunspots during a thirty year period within that cycle. Typical range of sunspots is 40,000 to 50,000 during modern periods. The Maunder Minimum coincided with the coldest part of the little Ice Age.

Linked into solar and equatorial-to-pole gradients, one must also include cosmic ray flux. An image by Nir Shaviv.<sup>17</sup> is provided

<sup>17</sup> Nir Joseph Shaviv is an physics professor, carrying out research in the fields of astrophysics and climate science. He is currently an associate professor at the Racah Institute of Physics of the Hebrew University of Jerusalem. He is most well known for his solar and cosmic rays hypothesis of climate change. In 2002, Shaviv hypothesized that passages through the Milky Way's spiral arms appear to have been the cause behind the major ice-ages over the past billion years. In his later work, co-authored by Jan Veizer,, a low upper limit was placed on the climatic effect of CO<sub>2</sub> (Wikipedia)

1 in Exhibit D. Increased galactic cosmic ray (GCR) flux theory suggests  
 2 association with a cooler climate and a weakening of monsoon rainfalls,  
 3 and vice versa. Dr. Shaviv argues that in contrast to a carbon-based  
 4 scenario, the model and proxy based estimates of atmospheric CO<sub>2</sub>  
 5 levels - especially for the early Phanerozoic period - do not show  
 6 correlation with the Paleozoic climate picture that emerged from  
 7 geological criteria, while cosmic ray flux does.

8 There is a large contingent of contributors to climate science that  
 9 acknowledges that the sun dominates earth's climate. The earth's orbit  
 10 around the sun, the earth's axial tilt, the earth's fluctuating albedo,  
 11 cosmic radiation, and the earth's water cover all influence warming and  
 12 cooling.

### 13 --- 14 **Conclusion to Section 2.5 Climate Change and Greenhouse Gases**

15 The time allotted for commentary on the Plan/DEIR is insufficient to  
 16 address comprehensively still more unsupported assertions contained in  
 17 DEIR section 2.5 "Climate Change and Greenhouse Gases". Briefly then,  
 18 the forecasted events that the Plan/DEIR portends - such as rising sea  
 19 levels, heat, wildfires from "climate change" - apparently warm or cool<sup>18</sup> -  
 20 public health and, last but not least, detrimental GHGs from a proliferation  
 21 of single family homes - carries no hard evidence that CO<sub>2</sub> is the throttle  
 22 that drives such ill effects. Nor does the Plan/DEIR provide evidence for  
 23 the harmful effect-threshold-level of anthropogenic CO<sub>2</sub>. .

24 "Given the importance of CO<sub>2</sub> to life on this planet; the large naturally  
 25 occurring CO<sub>2</sub> exchanges between land masses, oceans and atmosphere,  
 26 and the lack of conclusive proof that anthropogenic CO<sub>2</sub> can cause

<sup>18</sup> DEIR 2.5-19, page

1 significant detrimental global warming . . .”<sup>19</sup> demands that the DEIR  
2 jettison the section/chapter 2.5 in the interests of the communities the MTC  
3 and ABAG are meant to serve. The Plan’s cost to curtail CO<sub>2</sub> emissions is  
4 excessive and robs cities of funds essential to maintaining thriving  
5 communities.

6 The influences on climate brought into play in this commentary are to  
7 demonstrate the complexities of climate change and to underscore that  
8 legitimate scientific analysis *objectively* assesses *all* data available in order  
9 to arrive at conclusions that can be validated for purposes of scientific  
10 progress. The Plan/DEIR is essentially a policy-driven document that uses  
11 corrupted climate simulation models to obtain validation for its “social  
12 equity” agenda.

<sup>19</sup> Anthropogenic Global Warming Science Assessment Report, April 2013, Right Climate Stuff Research Team

Image by Greg Groesch

The environmental leg of the Plan Bay Area's three Es<sup>20</sup> cannot provide any "incontrovertible evidence", to steal 2 words from the IPPC, to support the DEIR's claim that increasing amounts of GHGs are endangering public health and welfare or will cause catastrophic ecological disruptions. Nor does there exist scientific evidence for anthropogenic global warming.

### Three Comments apart from DEIR Section/Chapter 2.5

- SB 375 mandates that each metropolitan planning organization and the agencies within those organizations have outreach efforts to inform the public (including landowners) and to encourage participation in the planning of any sustainable communities strategy. Those few citizens in Contra Costa County who had heard of Plan Bay Area through means other than the MTC and ABAG, such as unaffiliated newspaper editorial writers and radio programs, thought the policies being created by the Plan warranted public awareness. To that end, these few

<sup>20</sup> Economy, Equity, Environment

citizens sponsored and promoted a Lamorinda 2013 Town Hall informational meeting. Seventy-seven percent of those who completed the provided survey form indicated that they were completely unaware of the policies proposed in Plan Bay Area. Of that seventy-seven percent%, few had even heard of "Plan Bay Area". Only two conclusions can account for this revelation:

- Lamorinda is atypical of the San Francisco Bay Area population; or
- The mandate of SB 375 was not met.

ABAG posits that the Bay Area has an advantage over the rest of the U.S. because the tech industry dominates here. Thus the Bay Area share of national jobs will increase and, *pari passu*, population will increase. Ergo, a population increase is cause for housing development to accommodate that increase. Two factors contradict this premise:

- The assumed comparative advantage in the 1990's and 2,000's was the same but the Bay Area still experienced sluggish job growth and actually lost share of national jobs during those 2 decades. .

- From 2001 - 2012, the San Jose-Sunnyvale-Santa Clara STEM<sup>21</sup> occupations dropped to minus 12.6%<sup>22</sup> compared to a positive growth during the same period in :

21.1% Washington-Arlington-Alexandria, DC-VA-MD-WV  
 18.3% San Antonio-New Braunfels, Texas;  
 17.9% Raleigh-Cary, North Carolina  
 16.3% Salt Lake City, Utah

<sup>21</sup> Science, Technology, Engineering, Math

<sup>22</sup> Praxis Strategy Group

1 12.2% Austin-Round Rock-San Marcos, Texas  
2 11.3% San Diego-Carlsbad-San Marcos, California  
3

4 The only major metropolitan areas below San Jose-Sunnyvale-Santa  
5 Clara during that same period were New Orleans-Metairie-Kenner,  
6 Louisiana at minus 16.0% and Detroit-Warren-Livonia, Michigan at  
7 minus 17.7%. Perhaps a lesson here is an old one: never put all your  
8 eggs in one basket.

9 • In order to justify that more housing is required, ABAG uses for its  
10 number of employed persons per household the 1.2 person per  
11 household figure from 2010, which was the peak year for  
12 unemployment, the peak of the recession. (10.6 % Bay Area  
13 unemployment)

14 If employment rebounds, some of the unemployed in existing  
15 households regain jobs and the ratio of employed persons per  
16 household necessarily rebounds to a higher level than 1.2 persons per  
17 household. But ABAG doesn't factor that into its calculations. Thus the  
18 lower the number of employed persons per household, the more  
19 households that are required with any increase in employment. Not  
20 incidentally, 2010 was the year of the U.S. Census.

21 • The Plan states on Page 3 that Plan Bay Area derives from  
22 SB 375. However, anyone familiar with the Bay Area Alliance for  
23 Sustainable Communities established in 1997 knows that it developed  
24 the "Compact for a Sustainable Bay Area", finalized in 2003. SB 375  
25 was passed in 2008 and was preceded by AB 32 in 2006. This timeline  
26 is crucial to understanding "what drives what". The Bay Area Alliance  
27 for Sustainable Communities was composed of special interest & non-  
28 profit groups and ABAG & MTC representatives. It was funded by  
29 corporations and foundations with a partisan agenda. Exhibit E. The

C188-11

C188-12

1 policies of Plan Bay Area are essentially in lock step with the action  
2 items of the Compact for a Sustainable Bay Area. MTC and ABAG  
3 have created a regulatory scheme through Plan Bay Area for which  
4 there is no actual basis in law. If the legislature does not exercise its  
5 oversight function and authority, the courts must reign in these two  
6 lawless bureaucracies, the MTC and ABAG. Plan Bay Area is a perfect  
7 example of “mission creep” by these two agencies.

8

9

20 year period showing temperature fluctuations

October 27, 2009

The Honorable Lisa P. Jackson, Administrator  
Environmental Protection Agency  
1200 Pennsylvania Ave., NW Washington, DC 20460

Dear Administrator Jackson:

I write in regard to the *Proposed Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act, Proposed Rule*, 74 Fed. Reg. 18,886 (Apr. 24, 2009), the so-called “Endangerment Finding.”

It has been often said that the “science is settled” on the issue of CO<sub>2</sub> and climate. Let me put this claim to rest with a simple one-letter proof that it is false.

The letter is *s*, the one that changes *model* into *models*. If the science were settled, there would be precisely one model, and it would be in agreement with measurements.

Alternatively, one may ask which one of the twenty-some models settled the science so that all the rest could be discarded along with the research funds that have kept those models alive.

We can take this further. Not a single climate model predicted the current cooling phase. If the science were settled, *the model* (singular) would have predicted it.

Let me next address the horror story that we are approaching (or have passed) a “tipping point.” Anybody who has worked with amplifiers knows about tipping points. The output “goes to the rail.” Not only that, but *it stays there*. That’s the official worry coming from the likes of James Hansen (of NASA’s GISS) and Al Gore.

But therein lies the proof that we are nowhere near a tipping point. The earth, it seems, has seen times when the CO<sub>2</sub> concentration was up to 8,000 ppm, *and that did not lead to a tipping point. If it did, we would not be here talking about it.* In fact, seen on the long scale, the CO<sub>2</sub> concentration in the present cycle of glacials (ca. 200 ppm) and

interglacials (ca. 300-400 ppm) is lower than it has been for the last 300 million years.

Global-warming alarmists tell us that the rising CO<sub>2</sub> concentration is (A) anthropogenic and (B) leading to global warming.

(A) CO<sub>2</sub> concentration has risen and fallen in the past with no help from mankind. The present rise began in the 1700s, long before humans could have made a meaningful contribution. Alarmists have failed to ask, let alone answer, what the CO<sub>2</sub> level would be today if we had never burned any fuels. They simply *assume* that it would be the “pre-industrial” value.

- The solubility of CO<sub>2</sub> in water decreases as water warms, and increases as water cools. The warming of the earth since the Little Ice Age has thus caused the oceans to emit CO<sub>2</sub> into the atmosphere.

(B) The first principle of causality is that the cause has to come before the effect. The historical record shows that climate changes *precede* CO<sub>2</sub> changes. How, then, can one conclude that CO<sub>2</sub> is responsible for the current warming? Nobody doubts that CO<sub>2</sub> has *some* greenhouse effect, and nobody doubts that CO<sub>2</sub> concentration is increasing. But what would we have to fear if CO<sub>2</sub> and temperature actually increased?

- A warmer world is a better world. Look at weather-related death rates in winter and in summer, and the case is overwhelming that warmer is better.
- The higher the CO<sub>2</sub> levels, the more vibrant is the biosphere, as numerous experiments in greenhouses have shown. But a quick trip to the museum can make that case in spades. Those huge dinosaurs could not exist anywhere on the earth today because the land is not productive enough. CO<sub>2</sub> is plant food, pure and simple.
- CO<sub>2</sub> is *not* pollution by any reasonable definition.
- A warmer world begets more precipitation.
- All computer models predict a smaller temperature gradient between the poles and the equator. Necessarily, this would mean fewer and less violent storms.
- The melting point of ice is 0 °C in Antarctica, just as it is everywhere else. The highest recorded temperature at the South Pole is -14 °C, and the lowest is -117 °C. How, pray, will a putative few degrees of warming melt all the ice and inundate Florida, as is claimed by the warming alarmists?

Consider the change in vocabulary that has occurred. The term *global warming* has given way to the term *climate change*, because the former is not supported by the data. The latter term, *climate change*, admits of all kinds of illogical attributions. If it warms up, that's climate change. If it cools down, ditto. Any change whatsoever can be said by alarmists to be proof of climate change.

In a way, we have been here before. Lord Kelvin "proved" that the earth could not possibly be as old as the geologists said. He "proved" it using the conservation of energy. What he didn't know was that nuclear energy, not gravitation, provides the internal heat of the sun and the earth.

Similarly, the global-warming alarmists have "proved" that CO<sub>2</sub> causes global warming.

Except when it doesn't.

To put it fairly but bluntly, the global-warming alarmists have relied on a pathetic version of science in which computer models take precedence over data, and numerical averages of computer outputs are believed to be able to predict the future climate. It would be a travesty if the EPA were to countenance such nonsense.

Best Regards,

Howard C. Hayden  
Professor Emeritus of Physics, UConn

## WATER VAPOR IS EARTH'S PREDOMINANT GREENHOUSE GAS MAN-MADE CARBON DIOXIDE HAS NEGLIGIBLE IMPACT ON EARTH'S TEMPERATURE

THE 10,000 SYMBOLS (DROPLETS AND DOTS) REPRESENT THE PROPORTIONAL PRESENCE OF ALL GASES IN EARTH'S GREENHOUSE ENVELOPE

DATA SOURCE: [http://www.geocraft.com/WVFossils/greenhouse\\_data.html](http://www.geocraft.com/WVFossils/greenhouse_data.html)

💧 WATER VAPOR...9500 GREEN DROPLETS 95%\*

● NITROUS OXIDE, METHANE, MISC...140 YELLOW DOTS 1.4%\*

\*PERCENTAGE OF EARTH'S TOTAL GREENHOUSE ENVELOPE

MAN MADE  
CO<sub>2</sub>

NATURALLY OCCURRING WATER VAPOR IS EARTH'S PREDOMINANT GREENHOUSE GAS, BENEFICIALLY RETAINING THE SUN'S RADIANT HEAT SO THAT PLANT, ANIMAL, AND HUMAN LIFE CAN FLOURISH. WITHOUT WATER VAPOR, OUR EARTH WOULD FREEZE OVER, MAKING PLANET EARTH UNINHABITABLE.

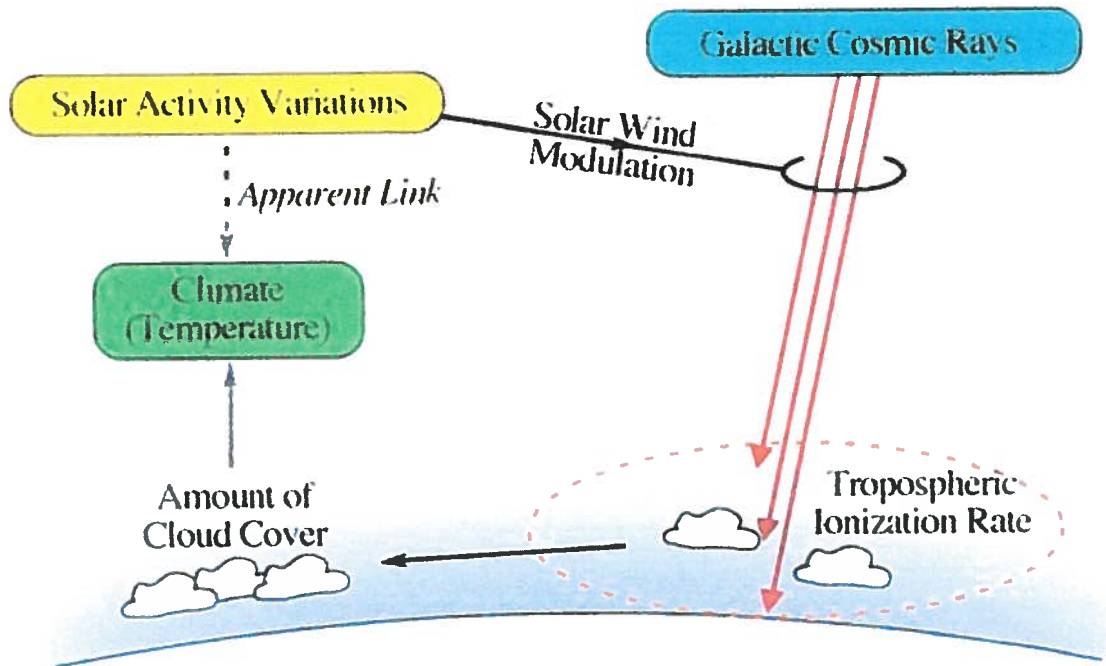

CARBON DIOXIDE PLAYS A SMALL ROLE IN RETAINING THE SUN'S HEAT. 96.6% OF ATMOSPHERIC CO<sub>2</sub> IS PRODUCED BY NATURE AS REPRESENTED BY THE 348 GRAY DOTS. MAN'S ADDITION TO THE TOTAL AMOUNT OF CO<sub>2</sub> IS NEGLIGIBLE, AS REPRESENTED BY THE 12 BLACK DOTS.

THE GOAL OF GLOBAL WARMING ALARMISTS IS TO REDUCE CO<sub>2</sub> EMISSIONS SO THAT OVER DECADES OF TIME THESE 12 DOTS MIGHT BE DECREASED TO PERHAPS 8 OR 9 DOTS.

REDUCING MAN MADE CO<sub>2</sub> WILL HAVE NO MEASURABLE EFFECT ON EARTH'S TEMPERATURE READINGS.

Exhibit C

The image above shows the cosmic ray link between solar activity and the terrestrial climate. The changing solar activity is responsible for a varying solar wind strength. A stronger wind will reduce the flux of cosmic ray reaching Earth, since a larger amount of energy is lost as they propagate up the solar wind. The cosmic rays themselves come from outside the solar system (cosmic rays with energies below the "knee" at  $10^{15}$  eV, are most likely accelerated by supernova remnants). Since cosmic rays dominate the tropospheric ionization, an increased solar activity will translate into a reduced ionization, and empirically (as shown below), also to a reduced low altitude cloud cover. Since low altitude clouds have a net cooling effect (their "whiteness" is more important than their "blanket" effect), increased solar activity implies a warmer climate. Intrinsic cosmic ray flux variations will have a similar effect, one however, which is unrelated to solar activity variations.

## **e-vision the future: environment, equity, economy**

**"We envision a Bay Area where the natural environment is vibrant, healthy and safe, where the economy is robust and globally competitive, and where everyone has equitable opportunities to share in the benefits of a quality environment and prosperous economy."**

## Introduction

The fundamental GHG reduction strategy embedded within the *Plan Bay Area* and the accompanying DIR emulates the land-use/transportation philosophy that has been in effect for over three decades in Portland, Oregon. The assumption behind this concept is that individual travel patterns can be significantly and permanently altered through a combination of regulatory interventions in the market: strict limits on new roadway construction, massive expenditures on new transit service (especially light rail), and land-use mandates that both require and subsidize mixed-use, high-density development in transit corridors while simultaneously prohibiting lower-density growth. A partial list of plans and policies (state, regional and local) demonstrating this commitment includes the following:

- Creation of a regional public transit district (TriMet) for the Portland metro area in 1969. This agency has a ***dedicated source of non-farebox revenue*** – a regional payroll tax -- that provides TriMet with stable and growing general fund revenues that are ***70% higher than peer agencies.***<sup>i</sup>
- Cancellation of a planned urban freeway for east Portland in 1975, with the federal funds for that project transferred to TriMet to allow construction of one of North America's first light rail lines, which opened in 1986;<sup>ii</sup>
- Adoption of a regional Urban Growth Boundary in 1979, which prohibits most forms of land development outside of existing built-up neighborhoods;
- Cancellation of a new highway on the west side of Portland in 1991, replaced with light rail expansion and mandated TOD in the light rail corridor as a means of reducing VMT;
- Enactment of a state Transportation Planning Rule in 1992, requiring the four largest cities in Oregon to reduce per-capita VMT by 20% over 30 years and to reduce total parking spaces by 10%;
- Adoption of the Metro 2040 Plan in 1995, committing the Portland region to a regulatory plan to densify the region, build out an extensive rail transit network, and accommodate most future jobs and housing in a limited number of transit-oriented "regional centers" and "town centers";

- Adoption of the Portland Central City Management Plan in 1995, establishing a goal of 60% transit mode share for commuting in the central city by 2010;
- Opening of new light rail lines in 1998, 2001, 2004, and 2009, with additional extensions scheduled for service in 2015 and 2019; and
- Opening of a 16-mile suburb-to-suburb commuter rail line in 2009, in lieu of roadway expansions in the same corridor.

Because of these and many other policies, the Portland region has become an international leader in the application of New Urbanist development principles and Smart Growth regulatory policies.

This author has been conducting field research since 1996 to determine if such policies actually work once they are applied. A particular research focus has been on the functioning of high-density, mixed-use transit-oriented developments (TODs) at light rail and streetcar stations. Unlike much of the literature on this subject, which attempts to measure travel patterns based on self-reported survey data, modeling exercises, or pneumatic tubes placed at curb cuts of TODs, the methodology of the Cascade Policy research has been to place observers out in the field and count every passenger-trip in and out of TODs by all modes, for selected hours. These observations have been done mostly on good weather weekdays at the morning peak period of 6:30 a.m. – 8:30 a.m., but have also included mid-day counts, afternoon peak period counts, and weekend observations at TODs deemed worthy of such effort.

The research has included observations at over 30 rail transit stations in downtown Portland as well as suburban locations, covering thousands of residential units and hundreds of employers. The results have been presented at academic conferences at the state, regional and national levels during the past four years. This research informs the following critique.

### **Assessing the *Plan Bay Area***

The draft *Plan* mimics the Portland strategy in most respects. It includes a much larger geographical region, a larger population base, and various heavy rail lines that Portland does not have, but the fundamental approach is the same: funnel most future development into a limited number of centers served by transit; spend most transportation dollars on maintenance of the existing system with capacity expansions focused on transit, not highways; and assume that transit use will increase substantially, resulting in improved air quality and reduced GHGs.

However, before Bay Area officials adopt such a plan, they should consider the results from the Portland regional experience. Virtually every assumption about changing travel behavior has proven to be wrong.

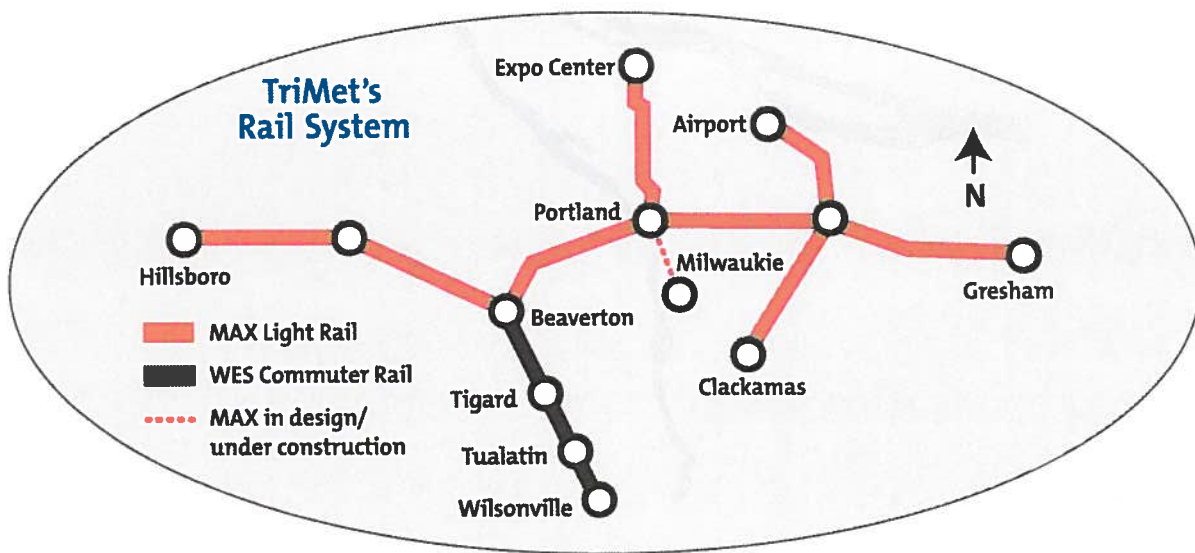

C189-1

**Failed Assumption #1:** Transit market share can be substantially increased through integration of land-use and transportation planning with a heavy emphasis on TOD.

**Reality:** Peak-hour transit use is flat or declining in every major Portland market, despite a moratorium on new highways since 1982, billions of dollars in additional transit subsidies, and mandatory TOD throughout the region.

The graphic below displays the crown jewel of TriMet's transit system, the light rail network along with the sole commuter rail line. Although buses carry 67% of daily boardings, rubber-tired service is not considered glamorous by local officials so it receives little in the way of investment capital or publicity.

### Trends in Transit Market Share for Various Geographic Markets in the Portland Region

#### Transit Mode Share for Weekday Commuting Portland metropolitan region, 1970-2010

| 1970 | 1980 | 1990 | 2000 | 2010 |

*Source: Annual Downtown Employer Census, Portland Business Alliance*

The most natural market for transit use is in the downtown core. Here, ***transit market share has plummeted over the past decade***, from 46% of commute trips via transit to 36% (including the streetcar), while auto commuting has only dropped from 49% to 48%. The big gains have been in biking and walking, but those modes have taken market share from transit, not auto commuting.

In 1995, the Portland City Council adopted a land-use/transportation plan called the Central City Management Plan. This plan established a goal of 60% transit mode share for peak-hour commuting by 2010. The actual number turned out to be 39%.

However, this has not stopped Portland planners from continuing to make absurd predictions. When the City Council adopted its latest sweeping vision for the future – the **Portland Plan**, adopted in April 2012 – it doubled down on Smart Growth, approving a goal of ***reducing SOV commuting in Portland from 69% in 2011 to 30% by 2035***. There is no reason to believe that this projection will be met.

The plan also predicts that average daily VMT per capita in Portland will drop from 18.7 miles to 11 miles, despite the fact that daily per capita VMT has only dropped by .1 since 1990 in Portland.

In essence, Portland politicians continue to believe that if they simply predict less driving in the future, it will happen. Bay Area officials should be more realistic.

**Failed Assumption #2:** Requiring and/or subsidizing transit-oriented development (TOD) should be the centerpiece of any urban planning strategy to reduce GHGs and VMT.

**Reality:** TOD can marginally increase transit mode share compared to low-density neighborhoods, but auto travel remains the dominant mode. The following case studies are illustrative.

### **Case Study: Gresham Civic Station TOD TriMet Blue Light Rail Line (MAX)**

Gresham Civic Station has been intensively planned for more than 25 years, with expectations that this would be a showcase for suburban TOD. The entire 100-acre site was bare dirt when the Blue MAX line opened in 1986, and offered the possibility of a “blank slate” for planners to create high-density, mixed-use developments focused around light rail.

***Gresham Civic Station. Light rail bisects the site running east-west from Gresham to Portland.***

Unfortunately, the land was sold several times and various development concepts were conceived but never built into the 1990s. A major north-south road, Civic Drive, was built to link Burnside with Division (two east-west arterials), but for years no other construction took place. Eventually much of the site was built-out (with various local, state and federal subsidies), featuring a shopping center, a medical complex, and several hundred units of housing.

Initially the neighborhood did not have its own dedicated light rail station, so anyone who wanted to get to the site had to walk a short distance east to the Gresham City Hall station. However, on December 1, 2010, TriMet celebrated the opening of the Gresham Civic light rail station.

*In 1995, Gresham Civic Station was just a dream. The MAX light rail line bisected the large site, but only a road had been built. Multiple developers bought and sold the site before a profitable formula could be found.*

Since this TOD has both a large housing component and a shopping center, traffic counting was done for two different peak periods on a mid-week day in December 2010. For work commuting, observations were made from 7:00 a.m. to 9:00 a.m., focusing especially on the four east portals where many of the on-site residents would leave from. For the shopping peak period, monitoring was done from 10:30 a.m. to 12:30 p.m.

| Total      | 3,315             |                           |                       | 100%                    |

*Today, Gresham Civic Station offers a mix of office, retail, educational and housing products.*

***The “Crossings” at Gresham Civic is a high-density, mixed-use building with ground-floor retail and residential on top, across the street from the light rail station. The cost premiums related to TOD design totaled \$3.2 million; Metro contributed \$950,000 in public funds to help offset those costs.<sup>iii</sup>***

As a TOD, Gresham Civic Center offers all the amenities that TriMet/Metro planners originally hoped for: a mixture of high-density housing products (apartments, condos, townhomes and single family houses), numerous retail shopping choices, and office space. The site also offers a mixture of transportation modes.

However, parking is reasonably available in all areas, and for some of the housing projects there are even gated parking lots. Private auto use is the dominant mode choice for most trips to and from the site. The TOD probably has a higher than normal percentage of people walking from their homes to retail sites (*intra*-site trips as opposed to the *inter*-site trips we were monitoring) at certain times and days, but overall more than 96% of passenger-trips are taken via the private automobile.

The light rail station itself has not proven to be a “catalyst for mixed-use development”, as Portland planners commonly assume. In fact, for most development concepts, proximity to a light rail station is a nuisance, not an amenity. Thus despite commercial success building out other parts of the TOD, land closest to the LRT station remains undeveloped. The regional government, Metro, bought up 13 acres of land adjacent to light rail to land-bank for future development, and most of that remains in public ownership.

*Twelve years after the successful build-out of Gresham Civic Station, the light rail station remains isolated.*

**Case Study: Russellville TOD, Portland  
Blue light rail line**

Russellville is an 11-acre, PDC-sponsored project built to a density of 52 units per acre, located immediately south of the 102<sup>nd</sup> street MAX station. Despite the density and location, light rail ridership during the morning peak is only 13% of all trips, while auto use (mostly SOV) accounts for 79% of all person-trips (both in and out).

*Russellville TOD at the intersection of E. Burnside and 102<sup>nd</sup>. The light rail station is in the foreground.*

*Internal street parking at Russellville is usually near capacity due to inadequate off-street parking. The parking restrictions are based on the assumption that many trips will be taken on nearby light rail.*

**Transit Use at AM Peak Period, 6:15 a.m. – 8:30 a.m.**

**Russellville Commons TOD**

**Density: 52 units/acre**

| Observation points           | Auto Passenger-trips | MAX        | Pedestrian | Bike      |
|------------------------------|----------------------|------------|------------|-----------|
| 102 <sup>nd</sup> & Ankeny   | 89                   | 27         | 2          | 1         |
| 102 <sup>nd</sup> & Pine     | 67                   | 5          | 9          | 0         |
| 105 & Stark                  | 120                  | 0          | 7          | 2         |
| 105 <sup>th</sup> & Burnside | 55                   | 23         | 7          | 4         |
| <b>TOTAL:</b>                | <b>331</b>           | <b>55</b>  | <b>25</b>  | <b>7</b>  |
| <b>Mode split in %</b>       | <b>79%</b>           | <b>13%</b> | <b>6%</b>  | <b>1%</b> |

Russellville was built from the ground up as a high-density TOD because the land was vacant and publicly owned at the time the light rail line opened. Thus, it was a “boutique” project that was subsidized (at least \$325,000 in cash grants plus a 10-year property tax abatement) and did not face many of the traditional market barriers for development. Across the street to the north of the light rail station, a traditional Portland neighborhood already existed in 1986, built-out to a much lower density of five units per acre. Since this neighborhood has never densified after 27 years of light rail, it offers an interesting “control” group to compare with Russellville, since both have equal access to light rail. Monitoring of this neighborhood was done in June 2010.

*Across the street from Russellville (north of Burnside) is an older Portland neighborhood that never densified after MAX was built. The mode split for that neighborhood is below.*

Transit use at peak commuter period, 6:15 a.m. – 8:30 a.m.  
 Glisan-Burnside Neighborhood  
 Density: 5 units/acre  
 June 29, 2011

| Observation points                            | Auto Passenger-trips | MAX | Pedestrian | Bike |
|-----------------------------------------------|----------------------|-----|------------|------|
| 104 <sup>th</sup> /103 <sup>rd</sup> & Glisan | 31                   | 0   | 2          | 0    |
| 105 <sup>th</sup> /106 <sup>th</sup> & Glisan | 27                   | 0   | 0          | 1    |
| 102 <sup>nd</sup> /Davis St path              | 0                    | 5   | 0          | 2    |
| TOTAL:                                        | 58                   |     |            |      |
| Mode split in %                               | 85%                  | 7%  | 3%         | 4%   |

The transit use at Russellville is 86% higher, but the density at Russellville is **10 times** that of the Burnside-Glisan neighborhood. This suggests that simply increasing density and providing transit service is not enough to offset the vast increase in driving and parking associated with TOD. Moreover, the 13% light rail usage observed at Russellville is not high in absolute terms, and is near the citywide average for transit use.

**Case Study: Portland's South Waterfront District**  
**Streetcar, aerial tram, bus, bikeway, and future Orange light rail line**

Portland's South Waterfront urban renewal project is one of the most audacious brownfields redevelopment schemes ever planned in the country. Located on the west bank of the Willamette River in downtown Portland, the South Waterfront was long dominated by low-rise manufacturing and machining facilities, serviced by gravel roads. The 133-acre district is highly constrained for transportation infrastructure: there are no outlets to the east or south, and the roads leading in from the west and north are narrow and congested.

In the late 1980's, the Portland City Council adopted a series of land-use/transportation plans committing hundreds of millions of dollars in public subsidies to transform the district into a neighborhood of high-rises, with a large employment cluster provided by Oregon Health and Sciences University (OHSU), which planned to move much of its existing and future campus operations down from a nearby hilltop location.

***Portland's South Waterfront district has very high densities, limited roads, and very low parking ratios.***

In order to facilitate the redevelopment as a walkable, transit-oriented district, the Council prohibited any significant new road infrastructure. Instead, the City opted for a suite of transit and non-auto options including an aerial tram connecting the OHSU hilltop campus to the waterfront, a streetcar extension, an elevated pedestrian walkway connecting the district to adjacent residential neighborhoods, the widest bikeway in Portland, and access to a new light rail line.

*The South Waterfront features a streetcar, aerial tram (considered part of the transit network), a new elevated pedestrian walkway (right, just below the support tower for the tram), bus service, a huge bikeway (far right), and will soon have a new light rail station.*

As part of the light rail project, a new bridge is being constructed across the Willamette River to service the South Waterfront, but **no cars or trucks will be allowed** – only light rail, streetcar, bikes and pedestrians.

In addition, when fully built out, the district will allow no surface parking lots, and parking ratios for commercial and office properties will be the lowest in Portland – 2.0 per 1,000 square feet of space. This is being imposed as part of the city's goal of achieving 50% non-auto mode split for commuting and 40% for all travel.

Much of the district has been redeveloped, and additional construction by OHSU is underway. Just prior to groundbreaking for the light rail project, Cascade Policy Institute conducted a thorough traffic observational study of the entire district to obtain baseline data that will be used to compare travel patterns after light rail opens in late 2015. The research team counted every trip into and out of the district by all modes, from 6:00 a.m. to 10:00 p.m. The results show that despite the heroic efforts to encourage non-auto travel, private motor vehicles remain the dominant mode in the South Waterfront.

**Bi-directional person-trips to/from the South Waterfront District**  
**Average Weekday, all portals**  
**6:00 a.m. – 10:00 p.m.**

|            | All passenger-trips | Market share of trips by mode |
|------------|---------------------|-------------------------------|
| Auto/truck | 17,023              | 79%                           |
| Streetcar  | 1,832               | 9%                            |
| Bicycle    | 1,076               | 5%                            |
| Bus        | 926                 | 4%                            |
| Pedestrian | 642                 | 3%                            |
|            |                     |                               |

*Note: Research was conducted on various good-weather weekdays during the months of May-January, 2010-2011. Excludes aerial tram ridership, which is primarily internal trips to/from the OHSU campuses.*

It is clear that the city's goal of 40% non-auto mode share for all trips to/from the district will be difficult or impossible to achieve, despite extensive subsidies and regulatory interventions. Moreover, even if the mode split goals could be achieved, the types of non-auto options that have been provided in the district could never be replicated anywhere else in the city.

**Case Study: Cascade Station at Portland International Airport**  
**Red light rail line**

Cascade Station is a new shopping mall built just to the east of the Portland International Airport on the south side of Airport Way. It was originally envisioned as a TOD centered around the Red MAX line, which opened for revenue operation in September 2001. In fact, TOD was put forward by planners at the time as **the primary** justification for building the 5.5 mile light rail extension.

Cascade Station was considered an ideal site for TOD because it was flat, easily served by infrastructure, and completely vacant. Total acreage of the site is 120 acres. Bechtel Co. partnered with Trammel Crow development to build the MAX line in a public-private partnership, in exchange for an exclusive, 99-year lease to develop the site. However, for the first five years after MAX opened, no development took place. The primary reason was that the Portland City Council placed a 60,000 square foot limit on the size of any new retail establishments, in order to avoid "big box" development that would be in conflict with TOD principles. The market rejected this concept.

In February 2005, in a rare admission of a planning mistake, the City Council began the process to re-zoned Cascade Station to allow one large-format store of over 200,000 square feet, and one over 150,000 square feet. The anchor tenant turned out to be IKEA, which takes up 280,000 square feet.

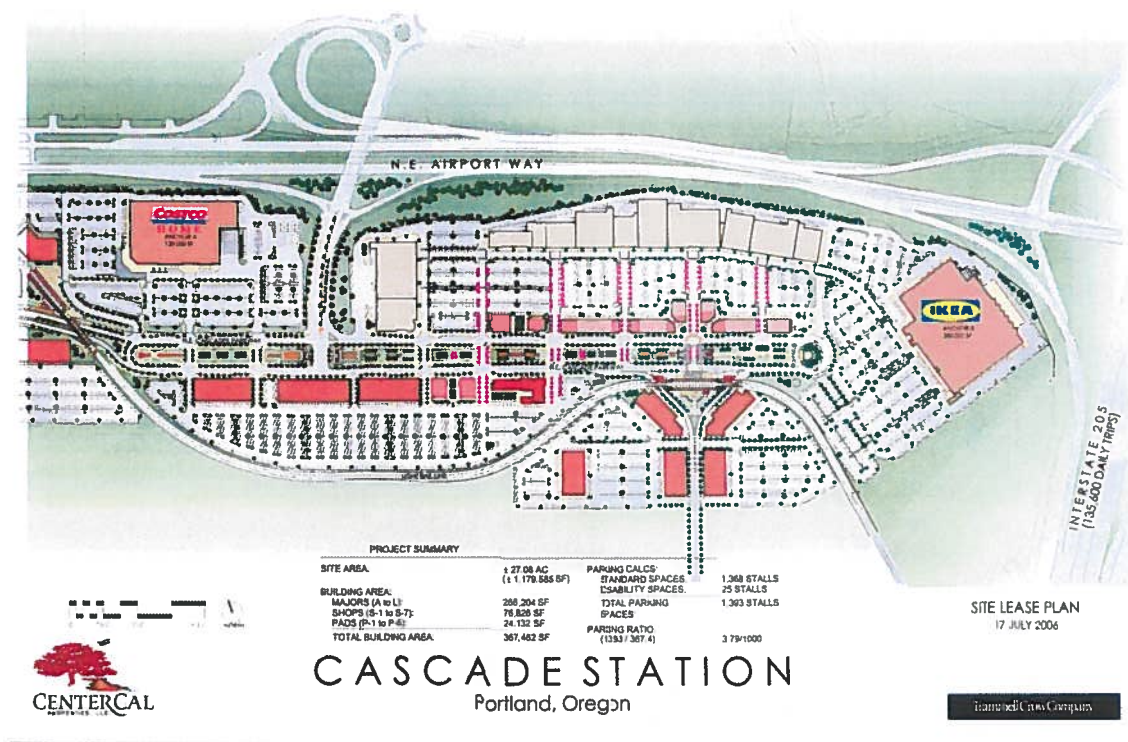

***Cascade Station TOD located at Portland International Airport. The large area to the south of light rail remains vacant 12 years after the opening of light rail. The anchor tenant – IKEA – is located at the Northeast corner.***

***Three years after the opening of the Red Line, Cascade Station remained just a dream.***

*In 2006, after the City Council changed the zoning code to allow large-format stores and parking, the market finally responded. Ground-breaking for IKEA (below) occurred in July 2006.*

*One of the many large-format stores now dominating Cascade Station.*

*IKEA is a short walk from the light rail station, but the train is irrelevant to most customers.*

| Total      | 5,300     |                        | 9,497                 | 100%       |

The observations for this study were limited to the east end of Cascade Station, which is clearly delineated by a traffic light at the entrance to the project near the Airport Way overpass. The east end is substantially built out, it has its own dedicated light rail station, and it is dominated by retail stores that would be of interest to shoppers on Black Friday. Also, the access is entirely controlled; there are only two entrances for automobiles/cyclists/pedestrians, and one light rail station. Thus, every trip in and out of the project can easily be observed.

The observations show that notwithstanding the availability of light rail, the ***travel patterns at Cascade Station are indistinguishable from those at any suburban mall.***

**Failed Assumption #3:** If we artificially constrain parking through regulation and density mandates, drivers will be incentivized to drive less and/or get rid of their vehicles.

**Reality:** While it is certainly true that the shortage of parking in dense, geographically constrained urban centers such as Manhattan and San Francisco encourages higher rates of non-auto travel, the same strategy is likely to fare poorly when applied across a large region. The Portland experience shows that limiting parking at TODs leads to a number of undesirable effects: illegal parking, refusal by

investors to build on parking-limited sites, lack of investment in retail, and risks to public health and safety due to inadequate access for fire and other emergency service vehicles.

**Case Study: Center Commons, NE Portland  
Blue, Red and Green MAX lines, bus service**

Center Commons is a mixed-use, mixed-income TOD sponsored by Portland's urban renewal agency, Portland Development Commission. The project is located next to a light rail station close to downtown Portland. It has a parking ratio of 0.6 spaces per unit and residential density of 65 units/acre. Due to the inadequate parking, dozens of cars are parked illegally on a daily basis, and additional vehicles regularly park in adjacent neighborhoods, despite high levels of transit service.

*Center Commons, located at NE 60<sup>th</sup> and Glisan, is adjacent to a MAX stop on the south side of I-84.*

***In 1997, ODOT owned this under-utilized 5-acre site on the south side of the Banfield Expressway (I-84), adjacent to a light rail station. It was sold to PDC in cooperation with Metro, to be re-sold to a private developer in accordance with TOD mandates.***

***The former DMV site became Center Commons, which opened in 2000.***

***Sidewalks are routinely blocked by cars (above and below) inside Center Commons due to the designed shortage of parking.***

*Parking is prohibited by city code on this 20' internal street, but Center Commons management has allowed parking for over a decade due to chronic shortages. This creates a fire hazard.*

C189-2

**Failed Assumption #4:** TOD development will work on a vast scale if we plan it in green fields where the lack of existing development will create a “blank slate” for the vision of planners.

**Reality:** *Even when TOD neighborhoods can be built as new neighborhoods, individual reliance on the automobile does not go away.*

#### **Case Study: Westside Light Rail**

The Portland to Hillsboro light rail line opened on September 12, 1998. Westside MAX was unlike any light rail line previously built in America: it was deliberately routed through vacant land in Washington County with the expectation that it would be a catalyst for TOD. The Federal Transit Administration (FTA) recommended against full federal funding for the project, on the grounds that the population density along the planned route was so light that the line would not attract sufficient ridership to justify federal funds.

In desperation, TriMet offered to make a binding legal agreement to force all local jurisdictions along the corridor to re-zone neighborhoods near rail stations at urban densities to generate future riders – much as the *Plan Bay Area* seeks to do across the Bay region. The agreement also required Metro to

adopt the “2040 plan”, approved by Metro in 1995, which limits urban growth boundary expansion, constrains the supply of new roads, and mandates high densities along rail lines.

In agreeing to these conditions, TriMet was stating that the Westside MAX would not be just a people-mover; it would change the nature of development in Washington County. A leading promoter of this vision said at the time, ***“MAX is more than a transportation investment. MAX is part of a conscious strategy to shape regional growth by coordinating transportation investments with land use policies.”***<sup>iv</sup>

As such, evaluation of the project would be different than with the Eastside line. TriMet planners admitted: ***“The success or failure of the public’s nearly \$1 billion investment in the Westside [MAX] will be determined in large part by what happens around its 20 stations. Unlike the East side MAX line, a substantial amount of land around the Westside is primed for development.”***

The agency boldly promoted this vision, garnering national attention. For example, *Newsweek* magazine gushed in May 1995: Portland is ***“building transit first, literally in fields, in the hope development will follow.”***

What did it mean to create transit-oriented neighborhoods from cow pastures? According to agency commitments in 1996, ***“TriMet is asking local governments along the rail corridor to take action to make development physically more dependent on transit by limiting parking, constraining automobile access, widening sidewalks, improving pedestrian access, allowing a mix of uses, and higher density development.”***

## LUTRAQ

At roughly the same time Westside MAX was being planned, debate raged in transportation and land-use circles about long-standing plans to expand highway capacity on HW 26, and to build the Western by-pass. Both HW 26 and HW 217 were already experiencing congestion problems, and ODOT managers felt that more capacity was needed on HW 26 from Portland to Hillsboro, and that an entirely new alternative was needed to HW 217. The southern portion of the Western by-pass was planned to run through mostly farmland from the Hillsboro region down to Wilsonville.

The local land-use advocacy group 1000 Friends of Oregon strongly opposed highway expansion. In order to generate more intellectual ammunition, 1000 Friends designed a modeling exercise to test the hypothesis that extensive use of “New Urbanist” principles in Washington County would reduce driving so much that it would obviate the need for new highway investments. They raised substantial funds for the analysis, and retained consultants such as Peter Calthorpe and Parsons Brinckerhoff to calculate the transportation effects of high-density zoning on a county-wide scale. The project was named LUTRAQ, which stood for Land Use, Transportation, and Air Quality.

The analysis concluded that Westside TODs along light rail could achieve 28% transit use by commuters in the weekday morning peak period (if the use of modest highway pricing was also implemented), and that overall vehicle use would be reduced sufficiently that new highway capacity would not be needed.

The study received substantial attention in international planning circles, and plans for new highway capacity were terminated by Oregon political officials.

### Fifteen Years Later

Westside MAX is now in its 15th year of operation. The evidence shows that TOD has failed to meet the criteria laid out by its promoters in the early 1990s.

Perhaps the prime example is Beaverton Creek light rail station. This was considered by TriMet planners to be the *single best TOD site* on the entire MAX line, east or west. Planners predicted that the development potential of the 134 acre Beaverton Creek site included 2,000 multi-family dwelling units, a 200 room hotel, 1.1 million square feet of retail, office and campus industrial, and 6,000 parking spaces.<sup>vi</sup>

Unfortunately, reality intruded. Little of that development actually occurred. Planners neglected to factor basic market forces into their vision. NIKE bought up the 74 acres of forestland immediately north of the LRT line in 1995 to land-bank for future campus expansion, and that land remains undeveloped.

The six acres immediately southwest of the LRT station, owned by Specht Development, remain vacant. This is not because the owners are opposed to TOD; it's primarily the result of unrealistic zoning by Beaverton related to parking and density. According to a representative of the landowners,

*Beaverton Creek light rail station – which TriMet planners believed would be the most successful TOD on the Westside light rail line – in construction, 1997. This project was designed with multi-story residential over retail with limited parking, a daring concept for suburban Portland.*

***Fifteen years after the opening of light rail, the ground-floor retail continues to go unleased. A lack of foot traffic and limited parking doomed the concept. Note that the land closest to light rail has never attracted any developers.***

***The mandated retail space at Beaverton Creek has had various tenants since 1998, including a pizza shop, a convenience store, and a computer service center, but none lasted more than a few years.***

*This six-acre site adjacent to Beaverton Creek light rail station should be ideal for a TOD, but stringent requirements for high density and limited parking has stifled investment.*

*"The primary reason it's never been developed is the **mandated lack of parking**. The Beaverton zoning ratio is 2.7 spaces per thousand square feet of office space; the market rate is 4. **We think light rail is an amenity but it doesn't take the place of parking in the suburbs. Lenders aren't going to go for a project like that.** Moreover, the high-density requirements are going to be expensive."*<sup>vii</sup>

The residential complex to the south, LaSalle Apartments, was built as hoped for, and quite a few of its residents (13%) take light rail on a regular basis. But the ground-floor retail, always part of the TOD vision, was poorly thought-out. It was mandated by planners who had no financial stake in its eventual implementation, and as a result the plan ignored market realities.

The retail spaces fronting the LRT station have been consistently vacant for at least the past nine years. The reasons are simple. According to the leasing agent in 2002: *"It's been tough, to say the least; it's not one of those 'field of dreams' things where you just open the door and people come through. **If I had to summarize the problem in one word, it would be parking. When I show prospective tenants around, they say, 'where will my customers park?', especially on the spaces fronting light rail. It would be nice to get Starbucks there, to become an anchor tenant of sorts, but they aren't remotely interested.**"*<sup>viii</sup>

According to the current leasing agent, the retail spaces continue to be a challenge, and rents are available at a discount. They hope to attract service-type tenants such as lawyers or CPAs, people who don't rely on foot traffic, because there isn't any.<sup>ix</sup>

***The Beaverton Round, one stop east of Beaverton Creek station, is one of TriMet's most celebrated TODs, but it has never fulfilled expectations for it by planners.***

***Architectural renderings for TODs are notoriously misleading. In this sketch for the Beaverton Round, light rail is featured, along with a pedestrian plaza and high density housing – but no parking. The actual project today is entirely dominated by parking.***

***The first two developers for The Round went bankrupt, as the concept was financially infeasible.***

***The partially-built Round in 1999. The Westside light rail line opened in 1998.***

***Contrary to early promises, parking proved to be necessary at the Round, as it is at all development projects.***

***Not only does the Round have substantial surface parking, it has the largest structured parking facility in Beaverton.***

***Water damage to the residential structure during the first bankruptcy required extensive repairs later. Unlike the predictions seen in architectural drawings, it occasionally rains in Portland.***

***The Round has had chronic problems attracting and keeping retail tenants.***

**Peak-Hour Counts at Westside MAX TODs**  
**All passenger-trips in/out, 6:30 – 8:30 a.m., Weekdays**  
*Midweek days, various months during 2008*

|                         | <b>Total Passenger-<br/>Trips</b> | <b>Auto</b> | <b>Ped</b> | <b>MAX</b> | <b>Bike</b> |
|-------------------------|-----------------------------------|-------------|------------|------------|-------------|
| Beaverton Creek station | <b>4,510</b>                      | 93%         | 2.2%       | 4.0%       | 0.7%        |
| Millikan Way station    | <b>1,542</b>                      | 88.9%       | 4.0%       | 6.0%       | 1.1%        |
| Elmonica station        | <b>785</b>                        | 91.3%       | 4.2%       | 3.5%       | 1.0%        |
| Quatama station         | <b>1,050</b>                      | 88.6        | 3.1%       | 7.8%       | 0.4%        |
| Hawthorn Farm (Intel)   | <b>650</b>                        | 94.9%       | 1.5%       | 3.4%       | 0.3%        |
| Orenco Gardens          | <b>689</b>                        | 86.2%       | 3.0%       | 8.5%       | 2.3%        |

Promoters of the Westside MAX hoped to fundamentally change the development patterns of Washington County, and thereby change travel behavior as well. While reduced auto use has been observed at many Westside TODs during peak commuting hours, reliance on private transport is not significantly different from more traditional neighborhoods. The LUTRAQ projection of 28% rail use for morning commute trips proved to be a fantasy; there are no Westside TODs where light rail use exceeds 9% in the morning peak, and at the largest employment centers such as NIKE and Intel, the use is below 4%.

C189-3

**Failed Assumption #5:** Politically-imposed high-density mandates of TOD will have no adverse effects on the livability of neighborhoods.

**Reality:** Portland planners have long used the power of zoning to limit development on the urban fringe (“stopping sprawl”), which means they have had to concurrently **mandate higher densities within the Urban Growth Boundaries**. As a consequence, large private yards for new homes anywhere in the Portland region have essentially been outlawed.

Moreover, even older homes are at risk of losing their private open space. Under Portland’s extensive urban renewal program, hundreds of acres of neighborhoods have been declared Urban Renewal Districts (thus by definition they are “blighted”) and upzoned for higher density. This process pits neighbor against neighbor, as individual homeowners on relatively large lots sell out to developers who tear down the one-story bungalows and build five-story apartment bunkers right up to the lot line, blocking sunlight to adjacent properties and invading their privacy.

As the photo below demonstrate, Portland developers are also incentivized through SDC waivers and property tax abatements.

***Portland planners consider large private yards near light rail to be a form of “urban blight” that must be filled in for the greater good. They are willing to subsidize high-density development in order to generate small increases in transit ridership.***

***It is doubtful that many Portland residents would consider this back yard to be a “problem” that needs solved with a 56-unit apartment building. These family-friendly yards are not available in new homes and are increasingly being lost in older neighborhoods due to Smart Growth mandates.***

**C189-4** **Failed Assumption #6:** Transit-oriented development on a mass scale is financially sustainable.

**Reality:** TOD requires substantial subsidies for both the high-density land development and the accompanying transit infrastructure, and no region in the country has the capacity to pay for these expenditures. Contrary to popular mythology, *density costs money*.

Urban growth restrictions make the cost of raw dirt far more expensive in Portland than in areas such as Texas where land development is relatively unconstrained. In addition, in highly regulated regions, the soft costs of lawyers, lobbyists, traffic consultants, and various exactions will make many forms of development infeasible without subsidies.

If a high-density, mixed-use project does get built, everything in the construction process will be more costly than a low-density project on the urban fringe. Any project requiring crane operators and iron workers will necessitate some of the highest unionized labor costs in America; the construction materials will be more expensive; safety/fire codes for residential on top of retail are complex and costly; and parking will be vastly more expensive if it requires going below-grade.

The chart below reflects the results of a Portland construction survey. Elsewhere in the country the costs would vary, but the basic correlation between density and price would not.

| Cost of New Housing in Portland |          |          |            |           |
|---------------------------------|----------|----------|------------|-----------|
|                                 | SFH      | Plexes   | Multi-Fam. | Mixed Use |
| Per person                      | \$17,961 | \$20,407 | \$28,377   | \$31,488  |
| Per Sq.Ft.                      | \$74     | \$74     | \$91       | \$96      |

| Building Cost by Density |                 |
|--------------------------|-----------------|
| Units per acre           | Cost per sq.ft. |
| 0-20                     | \$62            |
| 21-50                    | \$81            |
| 51-200                   | \$104           |
| 200+                     | \$125           |

Source: Portland Housing Cost Study, 1997

In addition to development costs, it is virtually impossible to pay for the transit service the many TOD projects being required by planners in Portland. The *Plan Bay Area* draft indicates that there will be financial challenges, and in Portland those challenges are already so severe that TriMet is likely to be insolvent by 2020.

As seen in the chart below, despite an all-funds budget increase of 125% since 2005, TriMet's service levels have dropped by 14%. Even with a dedicated (and growing) revenue source, TriMet's expenditures have risen so fast due to labor costs and rail transit construction that the agency has had to cut service five times in the past four years.

C189-5

## Conclusion

The draft *Plan Bay Area* attempts to reduce VMT-related emissions through regional land-use regulation, parking restrictions, minimal roadway expansion, and large transit subsidies. It is largely modeled on a Portland regional plan that has already been in effect for over 30 years and has failed.

One of the most important metrics for such plans is daily VMT per person, yet VMT has barely declined in Portland since 1990 (from 18.8 VMT per capital to 18.7 in 2011). Since 2000, VMT has dropped more significantly across the Columbia River in Vancouver, WA, yet Vancouver has no light rail and relatively modest growth containment policies. If Smart Growth policies are actually effective at changing travel behavior, these trends would be reversed.

**Daily VMT per person  
Portland and Vancouver since 2000**

|           | <b>2000</b> | <b>2011</b> | <b>% change</b> |
|-----------|-------------|-------------|-----------------|
| Portland  | 20.0        | 18.8        | -6%             |
| Vancouver | 21.8        | 17.6        | -19%            |

*Source: Metro, <http://library.oregonmetro.gov/files//dailyvmt-1990-2011-portland-vancouver-us.pdf>*

In other key metrics, such as transit use, TriMet is losing mode share even in its most natural market, downtown Portland, despite growing levels of subsidies.

The Bay Area market share for SOV travel has been 68% for 20 straight years, while transit share has stagnated at 10% for the same period. There is little reason to think that the types of interventions contemplated in the *Plan Bay Area* will nudge those numbers to any great degree.

C189-6

On a more optimistic note, perhaps the most interesting shift over the past twenty years has been the increase in working at home: from 3% to 6% in the Bay Area region. Given the explosion in high-speed wireless communication technologies in recent years, and the declining real costs of telecommuting, Bay Area officials should consider dropping the costly planning emphasis on land-use controls and transit, and embrace a strategy of encouraging remote employment. Significant VMT reductions could be achieved simply by employees working from home one or two days per week, at very little public cost.

Metropolitan Transportation Commission  
Plan Bay Area Public Comment  
101 Eighth Street  
Oakland, CA 94607

*re:* Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft  
Environmental Impact Report

Dear Metropolitan Transportation Commission,

This letter plus attachments from University of <sup>Southern</sup> California Professor Peter  
Gordon are submitted as public comment on the Draft Plan Bay Area and  
Draft Plan Bay Area Draft Environmental Impact Report (State  
Clearinghouse No. 2012062029).

MTC-ABAG  
Plan Bay Area Public Comment 101 8<sup>th</sup> Street  
Oakland, California 94607

May 16<sup>th</sup>, 2013

*re:* Public Comment on Draft Bay Area Plan and Draft Bay Area Plan Draft Environmental Impact Report

The *Bay Area Plan – Strategy for a Sustainable Region* (hereinafter Plan) suggests ways in which the Bay Area can meet mandated emissions targets. Specifically, it asserts that the decentralization of jobs in the region has fostered high levels of traffic congestion and suggests land use and transportation policies that will restrain auto use (“Preferred Scenario”).

But to assess the plausibility of all this, three questions must be addressed. (i) What do we know about modern American cities (actually U.S. metropolitan and urbanized areas; differences noted below)? (ii) How does what we know impact the efforts of Bay Area planners and their affiliates as they address air quality issues? (iii) Are the identified long-term trends durable and likely to continue? I will show that substantial available evidence suggests that the Plan’s efforts to funnel job growth to designated areas within the region are (a) unnecessary; and (b) unlikely to have beneficial effects.

## U.S URBAN DEVELOPMENT

Urban growth data are best understood using the Census Bureau’s urbanized areas (UZAs) [http://www.census.gov/geo/maps-data/maps/thematic\\_2010ua.html](http://www.census.gov/geo/maps-data/maps/thematic_2010ua.html). Unlike “metropolitan areas” (Metropolitan Statistical Areas, MSAs) which rely on fixed boundaries (usually clusters of counties), the UZAs define the actual footprint of development in any year. Table 1 shows population density data for the largest UZAs for each decennial census year since 1950. We see that average population densities fall in most places in most years. Suburbanization has been

the dominant trend for many years and is likely to continue. Cities everywhere are auto-oriented developments. The only exceptions are the surviving pre-auto downtowns and the relatively few walking districts scattered through various suburban areas across America. But these are not representative of the urbanized areas surrounding them.

## BAY AREA DEVELOPMENT TRENDS

The conventional two-way central city-suburb classification is misleading because there is variability in settlement patterns and residential densities and job availabilities within any major metropolitan area. The nine-county Bay Area is best understood if studied in terms of smaller-than-county geographic units. A useful source is the U.S. Census Public Use Microdata Sample (PUMS [http://www.census.gov/acs/www/data\\_documentation/public\\_use\\_microdata\\_sample/](http://www.census.gov/acs/www/data_documentation/public_use_microdata_sample/)) which reports data for areas designated as PUMAs. The nine-county Bay Area includes 54 PUMAs. Selected data for these PUMAs are in Table 2. In 2009, the Bay Area's PUMAs had an average population of 131,783 (standard deviation 23,403), an average area of 331 square kilometers (standard deviation 634) and average population density of 2,220 (standard deviation 2,468).

The Census chooses area boundaries to keep population counts roughly similar. Coefficients of variation (CV) are normalized standard deviations, e.g., the standard deviation divided by the mean. For example, the CV of Bay Area PUMA population is 0.18 (below 1.0, considered low) while that of areas is 1.92 and population densities is 1.11. Over the 54 areas, an array of densities and neighborhood types is included. But note that average journey-to-work travel time (all modes, one-way) was 27.2 minutes in 2009, with a standard deviation of 3.5 and coefficient of variation of just 0.13. The correlation between PUMA population density and PUMA average trip times was 0.004, zero for all practical purposes. By these measures, commuting durations were remarkably even throughout the Bay Area.

The PUMA data also include local jobs available. We see that the mean value was 71.6 jobs per local resident (aged 16-64 in the previous year), with a minimum value of 59.8 and a maximum of 81.5. It would be hard to label areas "job rich" or

“job poor.” There is substantial jobs-housing “balance.” But we have to dig deeper. Many of us drive past plenty of jobs on our way to work. We don’t stop until we reach the job that (all things considered) is the one that is right for us.

## COMMUTING AND DEVELOPMENT

Planners interested in air quality improvements focus on journey-to-work and see it as amenable to policy-based modifications. But when choosing locations, workers as well as employers consider a large number of trade-offs; workers understandably want to avoid costly commutes (mostly assessed in terms of time costs), but they have many other accessibilities and interactions to consider. The quality of local schools is a dominant consideration for families with school-age children, but there are also many other attractions that matter (including shopping, recreation, friends and family, etc.). This is why Professors Genvieve Giuliano and Ken Small (“Is the Journey to Work Explained by Urban Structure?” *Urban Studies*, 30:9, p 1485-1500) wrote “... we conclude that attempts to alter the metropolitan-wide structure of urban land use via policy intervention are likely to have disappointing impact on commuting patterns, even if successful in changing the degree of jobs-housing balance.” One of the reasons for this finding, they argue, is that most people’s commute is not that onerous and also some people prefer some buffer between home and work.

The dominant U.S. urban growth pattern has been one of substantial co-location of employers and employees because it is in the interest of each to avoid great distances between them.<sup>1</sup> Writing about the Bay Area, Robert Cervero (“Jobs-Housing Balance Revisited: Trends and Impacts in the San Francisco Bay Area” *Journal of the American Planning Association*, 62:4, p 492-511) concludes, “Changes in ratios of jobs to employed residents in the Bay Area during the 1980s suggest a general trend toward balance, lending some credibility to the co-location hypothesis. However, this was primarily attributable to jobs moving to labor markets ....” This pattern has evidently persisted.

---

<sup>1</sup> The phenomenon has been documented many times. See, for example, Edward L. Glaeser and Matthew E. Kahn, “Decentralized Employment and the Transformation of the American City” (Feb. 2001) National Bureau of Economic Research Working Paper # 8117.

Bumsoo Lee (2007)<sup>2</sup> examined the 79 largest U.S. metropolitan areas and compared commute times by drive-alone mode with job location in each area. He placed all commuters as either working in the traditional central business district, the various subcenters or outside of either, e.g. “dispersed.” The proportions of each for the largest (3-million or more population) metropolitan areas were 18, 14 and 68 percent, respectively. Plotting commute time vs. metropolitan area population, he found that steepest slope was for the CBD commuters while the least steep slope describes the dispersed workplace commuters; average trip times increase the least for those commuting to the dispersed workplaces. This is the spontaneous co-location tendency which explains the avoidance of the “traffic doomsday” that so many fear (and predict). Attempts to channel job growth to specific areas cannot reach this level of spontaneous worker-job matching. In the cases of establishing “greenbelts”, the experience has been that workers leapfrog the restricted areas in order to find the housing they want. This results in longer commutes.<sup>3</sup> People’s preferences usually assert themselves.

But this tendency, when unhampered, has been beneficial. Co-location explains the fact that travel times in the U.S. have been remarkably stable for many years. This also explains the conclusion by Prof Alex Anas (2012) that, “The data on the largest U.S. MSAs show that commute times increase only slightly with city size: the elasticity of the average commute with respect to the number of workers is about 0.1 in 1990 and 2000” (p. 146).<sup>4</sup>

Figure 1 shows the *distribution* of Bay Area commuting durations from the 2009 National Household Travel Survey <http://nhts.ornl.gov/> (solo-auto trips only shown here). This source includes data for individual trips reported and allows the nature of the distribution of trip characteristics to be studied.<sup>5</sup> The mean trip time (one-way) was 24.9 minutes. The important finding is that most trips were of shorter-than-average duration; the mean is pushed up by the outlier lengthy trips.

<sup>2</sup> Lee, Bumsoo “Edge” or “edgeless” cities? Urban spatial structure in U.S. metropolitan areas, 1980 to 2000. *Journal of Regional Science* 47 (3):479-515.

<sup>3</sup> Vyn, Richard J. (2012) “Examining for Evidence of the Leapfrog Effect in the Context of Strict Agricultural Zoning” *Land Economics*, 88:3. <http://le.uwpress.org/content/88/3/457.abstract>

<sup>4</sup> Anas, Alex (2012) “Discovering the Efficiency of Urban Sprawl” Ch 6 in Nancy Brooks, et al. *The Oxford Handbook of Urban Economics and Planning*. New York: Oxford University Press.

<sup>5</sup> Unfortunately, only a three-county area (San Francisco, Oakland and San Jose) was studied.

A recent University of Minnesota study ranks the San Francisco area as #2 in generalized accessibility in the U.S. <http://www.cts.umn.edu/access-study/acrossamerica/>. Unlike the other sources cited, this study employed a weighting scheme; not all accessibilities are equal.<sup>6</sup> To be sure, there are always pockets of congestion, but these are most likely to occur in the absence of rationing by pricing and/or the inability of planners to keep up via capacity expansion.

## POLICIES VS. TRENDS

Coincident with the documented benign unfolding of events have been the dashed hopes that people's housing and commuting preferences could be altered, that shorter commutes, less congestion, less auto-induced air pollution could be achieved from various land use regulations or policies. A recent Brookings Institution study ("From Traditional to Reformed: A Review of Land Use Regulations in the Nation's 50 largest Metropolitan Areas")<sup>7</sup> itemizes the many types of measures that have been adopted. But an analysis of recent urbanized area settlement trends (for 2000-2010) reveals no connection between policy regimes and outcomes. The last column of our Table 1 indicates thirteen UZAs which experienced increased population densities in the most recent decade, the period during which the policies studied should have had an effect. There is no observable connection between increased population densities and regulatory approach as discovered via the Brookings typology (Table 3 and Appendix table of their study). The 1,800 jurisdictions that were surveyed reported their efforts in six areas of land use regulation (zoning, comprehensive planning, containment, infrastructure regulation, growth control, and affordable housing programs and funding). These were detailed in terms of twelve measures. Factor analysis was then applied to classify metropolitan areas in terms of their dominant regulatory approach, e.g. twelve "clusters" of policies. The authors then arrayed the clusters into four "typologies of land use regulations" ("Traditional," "Exclusion," "Wild West

<sup>6</sup> "To generate the rankings for this study, Levinson created a weighted average of accessibility, giving a higher weight to closer jobs. Jobs reachable within 10 minutes are weighted most heavily, and jobs are given decreasing weight as travel time increases up to 60 minutes. Based on this measure, the 10 metro areas that provide the greatest average accessibility to jobs are Los Angeles, San Francisco, New York, Chicago, Minneapolis, San Jose, Washington, Dallas, Boston, and Houston."

<sup>7</sup>[http://www.brookings.edu/~media/research/files/reports/2006/8/metropolitanpolicy%20pendall/20060802\\_pendall.pdf](http://www.brookings.edu/~media/research/files/reports/2006/8/metropolitanpolicy%20pendall/20060802_pendall.pdf)

Texas,” “Reform”). There were very few increased average density UZAs and they were scattered *across* these groups.

But there is also an ominous well documented outcome. The intuition that reduced supply (or less responsive, e.g. less elastic supply) pushes up prices has been corroborated many times.<sup>8</sup> While sensitive areas should be protected, efforts to restrict development to fixed urban “footprints” have had the effect of raising land and housing costs. The extent to which people’s preferences can be altered by restricting choices is dubious. It is much more likely that people will search, settle and travel further to find a bundle of housing characteristics they like.

These results undermine the Plan’s stated interest shorter trips as well as in equity and improved housing affordability. In terms of recent events, the 1996-2006 house price bubble was most severe in the supply-constrained cities. Glaeser and Gyourko (2002) report that, “the price of housing is significantly higher than construction costs only in a limited number of areas, such as California and some eastern cities ... our evidence suggests that zoning and other land use controls ... play the dominant role in making housing expensive.”

<http://www.nber.org/papers/w8835>

## CONCLUSIONS

What is it most safe to say about the future of U.S. cities, including the Bay Area?

(i) The cars we drive will continue to get cleaner; more of us will choose hybrids and the like as they continue their technological evolution; (ii) Telecommuting will make inroads on traditional commuting habits.<sup>9</sup> These are some of the bright spots that will augment policy efforts to safeguard our environment.

The best plans are the ones that are evidence-based. The weight of the evidence with respect to what we know about U.S. metropolitan areas points to various powerful (and benign) trends, including the co-location of workers and jobs, which

<sup>8</sup> E.J. Glaeser, J. Gyourko, R E Saks (2006) “Urban Growth and Housing Supply” *Journal of Economic Geography* 6:1, <http://joeg.oxfordjournals.org/content/6/1/71.abstract>. Also Theo S. Eicher (2008) “Municipal and Statewide Land Use Regulations and Housing Prices Across 250 Major US Cities.” [http://depts.washington.edu/teclass/landuse/housing\\_020408.pdf](http://depts.washington.edu/teclass/landuse/housing_020408.pdf)

<sup>9</sup> Pengyu Zhu (2012) “Are telecommuting and personal travel complements or substitutes?” *Annals of Regional Science* 48:2.

serves to mitigate the traffic effects of growth. Plans that recognize and exploit these trends are the most promising. Plans that do not incorporate what we have learned about cities will fail and will even defeat their stated goals.

14 **No. 2012062029.**

15  
16 Dear Ms. Worth:  
17

18 California is in the greatest regulatory expansion in its history. These  
19 regulations effectively eat into the profits of existing industries, causing  
20 a necessary reduction in employees and job loss. The new jobs that  
21 will see an increase with the implementation of Plan Bay Area and the  
22 Bay Area Jobs Connection Strategy will be for regulators and  
23 compliance officers. This is hardly a prescription for a productive  
24 thriving California economy.

25  
26 In the Financial Assumptions of Plan Bay Area, under "Local Funding",  
27 it is stated that "The **majority** of funds that support Plan Bay Area come  
28 from **local** funding sources, primarily **dedicated** sales tax programs,  
29 revenues dedicated to local street and road maintenance and  
30 operations, transit fares and other transit revenues, and other local  
31 pricing initiatives." This amounts to stealing a city's funds, e.g.  
32 Orinda's, that are marked for specific and targeted uses (such as road  
33 maintenance and repair) for the development projects of Plan Bay Area.  
34 This is essentially taxation without representation.

C191-1

35 Under State Funding in this same "Financial Assumptions" report, the  
36 3<sup>rd</sup> paragraph refers to the Emission Factors forecasting software and

C191-2

Page 2

1 the MTC travel demand model, but does not provide either the software  
2 or the MTC model runs for public analysis. Further, in that same  
3 paragraph, it states that "Fuel consumption estimates reflect an assumption  
4 that the state gasoline consumption will decline at an increasing rate until  
5 2020 and then grow slowly at a constant long-term rate. The decline in the  
6 initial years for consumption is attributable to the improvements in the fuel  
7 efficiency of the fleet as brought about by AB 1493 (Pavley), Phase 1."<sup>1</sup>  
8 (Footnote added) First, what forecast prevails that Pavley 1 and its  
9 consequent decrease in MPG has an expiration date of 2020? Secondly,  
10 the MTC modeling indicates that because of Pavley 1, a 32 MPG by  
11 2035 is indicated. But that contradicts both the content above and the  
12 Plan's MPG statistic for 2010 - 2035 at ~20 MPG. How are these  
13 numbers reconciled?

RE: Comment on Draft Plan Bay Area and DEIR 2013 Clearinghouse  
No. 2012062029.

Dear Mr. Luce:

California is in the greatest regulatory expansion in its history. These regulations effectively eat into the profits of existing industries, causing a necessary reduction in employees and job loss. The new jobs that will see an increase with the implementation of Plan Bay Area and the Bay Area Jobs Connection Strategy will be for regulators and compliance officers. This is hardly a prescription for a productive thriving California economy.

In the Financial Assumptions of Plan Bay Area, under "Local Funding", it is stated that "The **majority** of funds that support Plan Bay Area come from **local** funding sources, primarily **dedicated** sales tax programs, revenues dedicated to local street and road maintenance and operations, transit fares and other transit revenues, and other local pricing initiatives." This amounts to stealing a city's funds, e.g. Orinda's, that are marked for specific and targeted uses (such as road maintenance and repair) for the development projects of Plan Bay Area. This is essentially taxation without representation.

Under State Funding in this same "Financial Assumptions" report, the 3<sup>rd</sup> paragraph refers to the Emission Factors forecasting software and

Page 1

1 the MTC travel demand model, but does not provide either the software  
2 or the MTC model runs for public analysis. Further, in that same  
3 paragraph, it states that "Fuel consumption estimates reflect an assumption  
4 that the state gasoline consumption will decline at an increasing rate until  
5 2020 and then grow slowly at a constant long-term rate. The decline in the  
6 initial years for consumption is attributable to the improvements in the fuel  
7 efficiency of the fleet as brought about by AB 1493 (Pavley), Phase 1."<sup>1</sup>  
8 (Footnote added) First, what forecast prevails that Pavley 1 and its  
9 consequent decrease in MPG has an expiration date of 2020? Secondly,  
10 the MTC modeling indicates that because of Pavley 1, a 32 MPG by  
11 2035 is indicated. But that contradicts both the content above and the  
12 Plan's MPG statistic for 2010 - 2035 at ~20 MPG. How are these  
13 numbers reconciled?

14  
15 Sincerely,

16

RE: Public Comment/Objections

Draft Plan Bay Area: Strategy for a Sustainable Region

March 2013

**C192-1** | **I urge Alternative 1: No Project.**

**C192-2** | This Program EIR is fraudulent because, admittedly, it bases cumulative planning and cumulative regional planning on **ASSUMPTIONS**. Very few varied data sources were used for such an encompassing Program EIR, and some data (1.2-8) was even sourced by ABAG, instead of other outside sources.

**C192-3** | The public is aware that billions of dollars will be spent to grease the way for any new transportation and land use plans. Of concern, per the Executive Summary, what “**incentives**” does MTC and ABAG plan for the implementation of changes to land use policy?

**C192-4** | What corporations, non-governmental organizations (NGOs) or government agencies will be “**project sponsors**?” Does MTC and ABAG have any sponsors in mind? If so, names of possible sponsors should have been revealed to the public in this Program EIR.

MAY 15 3 51 PM

**C192-5** While overly broad and restrictive in regard to some development issues, other issues are completely omitted. For instance, it is my opinion that this Program EIR did not fully consider or analyze all of the ramifications and impacts of a **major earthquake** with the proposed (and more centralized) development of housing and transportation.

**C192-6** Neither MTC nor ABAG have jurisdiction over land use regulations, but yet, this Program EIR is a manifesto for extreme land use regulations. This Program EIR discriminates against private property owners and favors corporate developers. Specifying that development can be done in one location but not another is not about saving the environment, it is about **controlling** the location of **development**.

**C192-7** This Program EIR should have no jurisdiction over public lands, and unless concurrent Environmental Impact Statements are done by both Department of Interior and USDA agencies (for example, the Bureau of Land Management and the Forest Service). MTC and ABAG may be overstepping its authority and jurisdiction.

**C192-8** Many aspects of this Program EIR go far beyond ground transportation planning and seem unconstitutional. For example, on page 1.2-25 it states "Priority Development Areas (PDAs) are nominated by local jurisdictions as appropriate places to concentrate future growth." Exactly **WHO** in the "local jurisdictions" is going to "nominate" the PDAs? Who decides what is "appropriate?" Will the decisions be made by an appointed committee? Will there be public meetings and agendas to notify the public? Will PDAs be voted on in an election by the people?

**C192-9** The Plan also states "using options along with amenities and services to meet the day-to-day needs of residents in a pedestrian-friendly environment." What if the "amenities" the local people want are private property rights for Americans in rural areas? What if the "amenities" the local people want are what is aesthetic to them, like seeing older, historical parts of a town? Why do vaguely referenced "jurisdictions" get to "nominate" development and/or specific types of development?

**C192-10** This Program EIR makes one cookie cutter plan for diverse geographical and cultural areas. For example, Vacaville, CA, is very different in many ways from San Francisco CA.

**C192-11** ES-40 mentions Integrated Pest Management. Specifically, what is this "integrated" with?

**C192-12** On page 1.2-11, it is stated: "RTPs must reflect the most recent assumptions for population, travel, land use, congestion, employment, and economic activity..." Again, the word "ASSUMPTIONS" indicates this Program EIR is **subjective** (not science-based) and biased by interpretation, including that of various laws and regulations, seemingly "cherry picking" certain phrases for a desired outcome that favors

MAY15 3 55 PM

corporate developers and special interests.

**C192-13** While world leaders worry about food security, this Program EIR plan puts an undue burden on rural areas and agriculture with restrictions to infrastructure “development.” This Plan will restrict agricultural economic growth.

**C192-14** I urge Alternative 1: No Project.

Bruce R. London, Public Comment on Draft Bay Area Plan and Draft Bay Area Plan Draft Environmental Impact Report, page number 1

1. This letter is submitted as public comment on the Draft Bay Area Plan and Draft Bay Area Plan Draft Environmental Impact Report (State Clearinghouse No. 2012062029).
2. I lived in San Francisco from 1977 to 1984. My wife and I decided that, for us, the suburbs offered the best surroundings in which to raise a family, and so we made the difficult work-related choices and financial sacrifices necessary to achieve our goal of purchasing an expensive single family home in a nice neighborhood. Orinda certainly met our needs, and we have enjoyed living in this city for the past twenty-nine years. Our personalities are such that we love the beauty of this semi-rural community. We agree with the description cited on the City of Orinda web-site, namely, a “serene setting in contrast to the more urban existence of the surrounding area.”<sup>1</sup>
3. Environmental concerns are important to my family. Our home contains a multitude of environmentally-friendly and extremely energy-efficient installations, many of which were quite expensive. We also own three hybrid vehicles. We have chosen this lifestyle as a matter of personal preference.

***ADVERSE VISUAL IMPACT ON ORINDA***

- C193-1**
4. The Draft Bay Area Plan Draft Environmental Impact Report (DEIR) states in the section titled AREAS OF KNOWN CONTROVERSY, “Concerns about whether the degree and scale of growth proposed within existing communities would alter their appearance, quality of life...”<sup>2</sup> The report reiterates this problem in Table ES-2: SUMMARY OF IMPACTS AND MITIGATION, # 2.10-3, under Impact: “Implementation of the Proposed Plan could affect visual resources by creating significant contrasts with the scale, form, line, color, and/ or overall visual character of the existing community.” This Table states that the Significance After Mitigation is ***Significant and Unavoidable***.<sup>3</sup>

1 [Http://www.cityoforinda.org/](http://www.cityoforinda.org/)

2 DEIR, page ES-11, paragraph 8

3 DEIR, page ES-55, Table ES-2

Bruce R. London, Public Comment on Draft Bay Area Plan and Draft Bay Area Plan Draft  
Environmental Impact Report, page number 2

**C193-2** 5. The DEIR restates this impact in TABLE ES-2: SUMMARY OF IMPACTS AND MITIGATION #2.10-4, this time in terms that will resonate with every resident of Orinda: "Implementation of the proposed Plan could affect visual resources by adding a visual element of urban character to an existing rural or open space area..." The Significance After Mitigation is again designated by the DEIR as *Significant and Unavoidable*.<sup>4</sup>

**C193-3** 6. Later, the DEIR accentuates this concept : "development could impact local visual resources by disrupting local character... While local standards and design guidelines would ultimately be the primary tools in shaping neighborhood character, changes in density would also play an important role."<sup>5</sup> *Local character* is what brought all of us to Orinda in the first place.

**C193-4** 7. This theme continues: "...development and transportation projects both have the potential to produce significant impacts. However, even when they are not significant, impacts could aggregate to produce potentially significant (PS) permanent impacts to visual resources."<sup>6</sup>

**C193-5** 8. Aesthetics aren't the only issue. According to the DEIR, "High density residential and high intensity commercial development, in particular, could have potentially significant (PS) light and glare elements at the local level. Overall, local impacts are less significant (LS) in urbanized areas and potentially significant in rural areas."<sup>7</sup>

**C193-6** 9. Question: Has your Plan for semi-rural Orinda studied the likelihood of light and glare problems?

4 DEIR, page ES-56, Table ES-2

5 DEIR, page 2.10-25

6 DEIR, page 2.10-29

7 DEIR, page 2.10-31

Bruce R. London, Public Comment on Draft Bay Area Plan and Draft Bay Area Plan Draft  
Environmental Impact Report, page number 3

10. According to *The Lamorinda Weekly* published on February 15<sup>th</sup>, 2012, Orinda's then- mayor, Victoria Smith, stated in a letter sent to the chairs of ABAG and MTC on June 9, 2011, which was discussed in the Orinda City Council meeting on January 31, 2012: "...approximately 40% of the land area within ½ mile of the Orinda BART station is regional open space (primarily EBMUD watershed)..." The article continues, "She [Victoria Smith] strongly urged ABAG and MTC to expand their public hearings beyond Dublin and Richmond to ensure that area residents will have their voices heard at programs presented at Lamorinda locations."<sup>8</sup>

11. Questions:

C193-7

a. Why have there been no programs at Lamorinda locations as requested by then-Mayor Smith?

C193-8

b. Why has the public been kept in the dark about a plan which will so adversely affect Orinda?

C193-9

c. How do you justify not allowing the citizens of Orinda to vote on this significant issue, when your own Draft Environmental Impact Report *repeatedly* describes the likelihood of re-shaping the character of this semi-rural city.

(CONTINUED ON PAGE 4)

Bruce R. London, Public Comment on Draft Bay Area Plan and Draft Bay Area Plan Draft  
Environmental Impact Report, page number 4

### ***FINANCIAL HARM TO ORINDA HOMEOWNERS***

C193-10

12. DEIR TABLE ES-2: SUMMARY OF IMPACTS AND MITIGATION, #2.14-1 states: "Implementation of the proposed Plan could result in the need for expanded facilities, the construction of which causes significant environmental impacts, in order to maintain adequate schools, emergency services, police, fire, and park and recreation services." The table states that the Significance After Mitigation is ***Significant and Unavoidable***.<sup>9</sup>

C193-11

13. United States Census Bureau data shows that between the years 2000 and 2010, the population of Orinda only grew from 17,599 to 17,643.<sup>10</sup> That is correct: an increase of only 44 people in a ten year period. The Draft Regional Housing Need Allocation for Orinda mandates 226 new units between 2014 and 2022.<sup>11</sup> Using ABAG's very conservative estimate of 2.75 occupants per unit, the Plan calls for at least 621 new Orindans in that short time span, with many more in subsequent years.

C193-12

14. The DEIR states: "To meet increased demand for these facilities, existing facilities would likely need additional personnel and equipment to maintain adequate service levels as the number of residents and jobs increases. In some cases, depending on the pattern of development, it will be necessary to construct new facilities to maintain adequate capital capacity, equipment, and personnel."<sup>12</sup>

15. Question: Who will pay for the required additional services and facilities?

<sup>9</sup> DEIR, page ES-75, Table ES-2

<sup>10</sup> [Http://censusviewer.com/city/CA/Orinda](http://censusviewer.com/city/CA/Orinda)

<sup>11</sup> [Http://www.abag.ca.gov/planning/housingneeds/pdfs/methodology/RHNA\\_Update\\_Le](http://www.abag.ca.gov/planning/housingneeds/pdfs/methodology/RHNA_Update_Le)

<sup>12</sup> DEIR, page 2.14-12

Bruce R. London, Public Comment on Draft Bay Area Plan and Draft Bay Area Plan Draft  
Environmental Impact Report, page number 5

C193-13

16. The DEIR assigns no responsibility to the Plan for these expenditures. Instead, it offers generalized remarks, such as: "...the California Department of Education relies on local control for the management of school districts. School district governing boards and district administrators allocate resources among the schools of the district."<sup>13</sup>

C193-14

17. The DEIR mentions four state regulations regarding fees levied on developers for school impacts, but does not specify whether these fees will be sufficient. In fact, the DEIR states that Senate Bill 50 (Leroy Green School Facilities Act of 1998) "eliminated the ability of cities and counties to require full mitigation of school impacts."<sup>14</sup>

18. Question: Will developer fees be adequate to cover the required additional teachers and school facilities?

C193-15

19. The DEIR does mention Proposition 1A, the Class Size Reduction Kindergarten-University Public Education Facilities Bond Act of 1998, which "allowed for eligible school districts to obtain state bond funds for the construction and modernization of educational facilities and accommodate for growth and overcrowding in educational facilities."<sup>15</sup> That was 1998. The state budget situation is quite different today. The media is replete with stories such as "California Retreats On Class-size Reduction" from *The Sacramento Bee*, 1/20/2013.<sup>16</sup>

13 DEIR, page 2.14

14 DEIR, page 2.14-7

15 DEIR, page 2.14-7

16 <http://sacbee.com/2013/01/20/5126801/california-retreats-on-class-size.html>

Bruce R. London, Public Comment on Draft Bay Area Plan and Draft Bay Area Plan Draft  
Environmental Impact Report, page number 6

20. Question: If the Plan is enacted in Orinda, should we expect additional parcel taxes to support our schools?

C193-16 22. The DEIR is just as vague regarding fire protection, stating, "Fire protection services are managed at the local level... Each fire protection agency is responsible for protecting its own prescribed area."<sup>17</sup>

C193-17 23. Similarly, for police services: "...each incorporated city and town has a police department responsible for police protection within its own jurisdiction... Cities and towns may also contract with the county sheriff department to provide law enforcement services."<sup>18</sup>

C193-18 24. Question: If Orindans will need to pay for additional required school, fire, and police services, isn't it only reasonable for us to vote on whether or not to accept the Plan?

## END OF COMMENTS

**To:** <info@OneBayArea.org>  
**Date:** 5/14/2013 2:51 PM  
**Subject:** Deadline for comments on One Bay Area Plan and associated EIR

Dear Sir or Madam:

**C194-1** Given the magnitude of the documents released to the public in late March and early April, the period of time allotted for public review and comment (with a deadline of 16 May) seems far too short. Kindly extend this deadline by at least 60 days to permit the public the opportunity to review the analyses and proposals more thoroughly.

Yours faithfully

Piers Whitehead

**Date:** 5/12/2013 12:41 PM  
**Subject:** One Bay Area in Marin

The One Bay Area proposal to urbanize Marin county is a social, environmental and economic disaster for Marin County. Marin county needs to be left alone and free of the soviet style central planners who want to destroy its unique character. There are plenty of urban areas in the Bay Area with problems, such as Richmond and Oakland, where these officious intermeddlers can ply their trade. Leave us alone.

Gentlepeople:

As a long-time Marinwood resident — since 1969 — I can vouch for the fact that OUR COMMUNITY IS NOT BROKEN — SO PLEASE DO NOT TRY TO FIX IT!

We DO NOT NEED OR WANT OUR COMMUNITY TO "GROW"!

WE DO NOT WANT TO LOSE OUR PRECIOUS OPEN SPACE THAT WE TAXED OURSELVES TO BUY MANY YEARS BACK!

WE HUMANS LIVE ON A FINITE PLANET, the only one in our solar system that supports life!

Why would we muck it up through over-population, the results of which include over-use in all areas of human activity?? The abuse of farmland through corporate farming, pollution of rivers, lakes, and streams, the draining of aquifers, continual increase in air pollution, decimation of forests, decimation of fish stocks through over-fishing..... this is a LOSE-LOSE proposition, and it is not good for any community nor for the continued health and vitality of the human species!

L.M. Arndt

Brenda Barron  
Oakland, California

C197 Hi. My name is Brenda Barron.

I urge you to invest in public transit operations to improve transit service.

I am currently a freshman in college at San Francisco State University. I was born and raised in Oakland California.

I've been taking public transportation since I was five years old when I started riding the bus to my mom's work. Public transit has changed a lot since I was five. Bus stops have moved farther from my house. There are fewer buses and I have to wait longer most of the time. Night service has been reduced; the bus I take stops at 10:00 pm. In the last few years, bus lines have been cut and changed, so that people get confused about which lines go to which place.

People want to see more bus routes and more frequent buses.

Many people take buses because they cost less than BART, but BART takes you farther and goes faster. I would like to see the BART and buses be less expensive, especially for young people who go to school. Most younger students don't have jobs, so they can't afford current transit fares, especially for BART.

There are other problems with current service levels. BART does not have enough trains so that people so that people can sit down. I often have to stand when I catch BART to go to school. BART has been having some issues lately with the tracks. I would also like to see cleaner buses and BART cars and stations.

Those are the transportation investments that matter to me, and matter to other younger people just like me.

Thank you.

**Subject:** Comments on the Draft EIR for the One Bay Area Plan

Comments about the One Bay Area Plan

Problems with the One Bay Area Plan:

- It mandates growth but does not help pay for the infrastructure to support growth: A) roads B) Sewer C) Schools D) Water E) Transportation that low income people can afford- instead GG Transit is cutting bus lines
- The so- called 'One Bay Area Plan' subverts local control. It is being foisted on us by ABAG, MTC and local officials and is yet another giveaway to big developers.
- So-called affordable housing does not remain affordable because after a number of years it is allowed to be sold at market value.
- At this time Fairfax is at gridlock several times/day, yet we are slated under this plan for 280 new 'units' -how many people/with cars/unit unknown.
- According to a study the MBC, 50 % of the traffic coming through Fairfax at commute times is from Novato- I am assuming that that traffic diversion will only increase as you increase housing density San Rafael, north.
- I support increasing workforce housing but oppose giveaways to developers who will make huge profits, while local communities can only look on as local rights are eroded. In 4 years, ABAG- an unelected body, will 'revisit' these numbers- and so far, they have always demanded increase of numbers. ABAG reminds me of a greedy ravenous monster, whose belly is never full.
- Fairfax, has been compared to the Oakland Hills in terms of fire danger-narrow windy roads with a fire load that increases by the year. If a fire were to start, during a traffic standstill, how would people get out of town? We cannot provide safe exits to people at the current population density. Locally, we are worried about them getting out at ANY time!
  - \* I know that CALTRANS has had plans on the books for a 4 lane highway from San Rafael to Point Reyes. When we reach total gridlock, which this housing infill plan will bring us to, we will have no choice but to destroy yet another facet of our small town life. I speak about Fairfax, but every town is slated for more housing in Marin.
  - \* 25 % of housing is slated to be built in toxic sites.
  - \* Why locate marginalized communities in areas that are more polluted and toxic when they have fewer health resources?
  - \* There is a massive push towards geoengineering to meet our water needs at the national level, and, on top of this insanity, this plan will open the floodgates locally for MMWD's multi-million dollar desal plant (with intake next to a sewer outlet, a bay so polluted with pesticides, herbicides, toxic metals, pharmaceuticals etc. that fisherman are advised not to fish out of it, nor people to swim in it- a project which our struggling residents, towns and infrastructure can ill afford in a failing economy.
  - \* We cannot accept the parameters offered by this 'plan'. There needs to be more public meetings and a mechanism for public debate- the way Kinsey handled the one at the civic center was atrocious- his pro- plan people were lined up and allowed 3 minutes/speaker- not much time, granted, but when it came to those who opposed the plan, we were limited to 1-2 minutes. That is NOT public input.
  - \* Kinsey needs to back off from accusing those who oppose the plan of racism.
  - \* I do not believe that it is a plan to afford 'affordable' housing- I believe that it is a backdoor to subvert local governments deciding how and where they allow new housing.
  - \* We do need workforce housing -let's find a way to subsidize it and cut out the middlemen- let's make local policy- town by town to meet local needs, and-if we are going to spend millions, let's have a public discussion. Many of them.
  - \* This plan should go to the electorate for a vote. But the 'One Bay Area' planners must not be allowed to control the ballot language. It must be put together by a group from all sides.

## Plan Bay Area 2040 Final Environmental Impact Report

C199

MTC-ABAG  
5-16-2013

The Draft Plan bay area is another BIG GOVERNMENT program that is being forced on the people of the Bay Area by a very clever government vehicle called REGIONAL GOVERNMENT.

Our elected city council members, board of supervisors were not elected to inflict this kind of punishment on the public.

Corporations, special interest groups, City Planners, and consultants across the US have written these laws and regulations to serve their own interests and to line their pockets.

IT IS VERY SAD ! WHAT HAS HAPPENED TO OUR COUNTRY.

Sincerely,

James Bitter

Marin County

**Subject:** Re developement Marin County...

C200

Unfortunately Marin County chose to block BART and so we have a major issue with traffic, to continue to develop Southern Marin is a nightmare... Yes Tiburon has room however Sausalito does not... Why can't we consider traffic issue's versus development issue's, other countries manage to have outstanding public transportation, our huge ferry's could stop like a bus south end of town north end of town, then keep it going until midnight and run every 30 minutes that makes more sense than what we have going with ferries right now....plus smaller ferry's (less fuel) built here so they can be repaired here. Thank You Linda Christopoulos a long long time resident of Marin County I have lived up & down 101 from Sausalito to San Rafael....

**C201** To: [info@OneBayArea.org](mailto:info@OneBayArea.org), [eircomments@mtc.ca.gov](mailto:eircomments@mtc.ca.gov)

**Subject: Recommendations for 2040 Plan Bay Area**  
[http://onebayarea.org/pdf/Draft\\_Plan\\_Bay\\_Area\\_3-22-13.pdf](http://onebayarea.org/pdf/Draft_Plan_Bay_Area_3-22-13.pdf)

In regards to Plan Bay Area Chapter 6, page 121:

*"In some cases, new legislation, updated regulations or additional resources will be needed to fully realize the Plan Bay Area vision and implement the plan's policies and programs. This chapter identifies the most important of these challenges, and proposes steps to address them."*

Please consider adding a new Chapter 6 section on Driving Pricing Measures that are outside of the direct influence of the One Bay Area Team, but help achieve the plan's Performance Targets 1, 7, 9A, 9B, and 10C. Driving Pricing Measures encompass both Plan Bay Area "Pricing Strategies" and "Climate Policy Initiatives." Regional advocacy of such policies within RTPs can influence development of statewide legislation and regulation.

As background, OneBayArea's 2010 PPT (<http://www.arb.ca.gov/cc/sb375/meetings/052510/mtcpresentation.pdf>) presented a driving pricing scenario to achieve large GHG reductions. The slide entitled "Auto Operating Costs Increase 4-fold" depicted a combination of {parking charges, congestion charging, and carbon/VMT tax}, raising auto operating cost from \$0.25 to \$1.20 per mile. OneBayArea indicated that "new legislation must be developed" to achieve this scenario. A 2010 memo ("Preliminary Report on Metropolitan Planning Organization (MPO)/Air Resources Board (ARB) Senate Bill 375 (SB 375) Target Setting Analysis" - <http://www.arb.ca.gov/cc/sb375/mpo/prelimreport.mtc.sacog.sandag.scaq.pdf>) from CA's four largest MPOs to CARB, similarly discussed implementing pricing measures to meet GHG reduction targets. In 2010, the 100-member MTC/ABAG SB375 Sustainable Communities Strategy Advisory Panel reached a strong consensus that driving pricing measures were needed.

Within the discussion of Driving Pricing Measures, three policies should be highlighted, the first two being of interest for having higher political popularity and viability compared to the policies that were described by OneBayArea in 2010.

#### **DRIVING PRICING MEASURE 1:**

##### **TITLE: Parking Charges + Incentives: Reduce Commuting VMT/GHG by 23%**

This measure helps with Performance Targets 1, 7, 9A, 9B, and 10C.

This pricing measure is related to Plan Bay Area's "commuter benefits ordinance" item, but brings about higher VMT/GHG reduction.

A 23% commuting reduction will produce 400,000 new green Bay Area commuters, saving 2B Bay Area VMT per year and 1M Bay Area tons of GHG/year. Transit ridership will more than double. Currently-struggling smartphone mobility services would thrive. HOV lanes will fill up. Traffic will go down. Lonely Bay Area workplace parking spaces encompassing 2,608 acres will be in-filled for higher and better use.

91% of US commuters are provided with free parking – this policy changes this with carrots and sticks. Each employee is charged \$0.25/day for SOV (single occupancy vehicle) commutes. This revenue is used to reward carpool/transit users with \$0.50 per day. Every 3 months, the charge and reward goes up, until the charge is \$2 and the reward is \$3. This cuts SOV from 77% to 54%.

To further increase political viability, the solution is zero-cost to employers. Employees report their commute mode (transit, carpool, SOV) in an on-line commute calendar. Smartphone LBS apps figure out the commute mode and auto-fill the calendar.

The policy has drawn supporting letters from MTC, Sierra Club, SVLG, VTA, samTrans, Transform, and Association for Commuter Transportation. The cost per ton of GHG removed is \$0.

From MTC's supporting letter, "There is no question that the provision of free parking is a huge incentive for people to drive to work. A 2000 survey of Bay Area commuters found that while 77 percent of commuters drove alone when free parking was available, only 39 percent drove alone when they had to pay to park. Additionally, among commuters with free parking, only 4.8 percent commuted by transit. By contrast, among commuters without free parking, 42 percent commute by transit." From the set of US employers with free workplace parking, there are four virtuous outliers: Google Mountain View at 52% SOV, Genentech South SF at 58%, Facebook Menlo Park at 59%, and Microsoft Redmond at 62% SOV. All four outliers spend much more on commute benefits than can be expected from marginally profitable firms. Traditional free-parked corporate commute trip reduction programs are comprised only of incentives without a driving price increase for SOV. These programs are disappointingly ineffective, often yielding only 1% commute shift.

From the Findings and Declarations of the stalled bill SB518 (California Senator Lowenthal's parking bill), "Eliminating subsidies for parking has enormous potential to reduce traffic congestion and greenhouse gas and other vehicle emissions by reducing vehicle miles traveled. If drivers must pay the true cost of parking, it will affect their choices on whether or not to drive. In the short term, changes to parking policy can reduce traffic congestion and greenhouse gas emissions more than all other strategies combined, and they are usually the most cost-effective." Free suburban office parking paid for by employers and provided freely to employees represents a perverse \$7.58 per day incentive for SOV commuting: employers pay for valuable parking space land that they give away to SOV commuters - transit commuters receive no such free land.

Similar parking charges + incentives policies were implemented twice in the late 1980's, at Twentieth Century Corporation in Los Angeles and at CH2M Hill in Bellevue Washington. SOV mode share decreased from 89% to 64% as a result of these policies.

- 10 min youtube + 3 page description with policy insights:  
<http://www.cities21.org/cms/index.php?page=we-solve-for-x-submission>
- Notes from policy discussions with Don Shoup, FHWA, CARB, MTC, SCAG:  
<http://www.cities21.org/dpwwg/parkingPolicy.htm>
- CA Legislative Counsel has helped to develop draft CA bill language.

#### Plan Bay Area Performance Targets

Policy increases GHG saved, so assists Target 1.

Policy helps with "falling short" Target #7 (reduce low-income budget necessary for transportation & housing - page 101). Compared to a gas tax increase, this policy is economically "progressive," meaning "a transfer of wealth from higher-income workers to lower-income workers." This is because higher income workers are more likely to commute by solo driving than lower income workers. The policy will not penalize low-income graveyard shift grocery/hospital workers and other low-income workers who have few alternatives to driving. The draft CA bill envisions developing "exception rules" to handle such cases. The Environmental Defense Fund has studied social equity impacts of policies to increase driving costs/pain. Their report concluded that exceptions have to be carved out of such policies to ensure social equity. The draft bill envisions fair, compassionate exceptions developed via a transparent process.

Policy helps with "falling short" Target 9A – increase non-auto mode share - page 103.

Policy helps with "falling short" Target 9B – reduce per capita VMT by 10% - page 103.

The policy generates \$750M per year in new revenue for public transit and other commute alternatives. This may help with Performance Target #10C (transit maintenance) and will provide much-needed transit agency budget improvement. The issue of developing increased Bay Area transportation funding is mentioned in the funding examples in Chapter 6.

#### **DRIVING PRICING MEASURE 2:**

**TITLE: Prop 103-compatible Pay-As-You-Drive (PAYD) Auto Insurance**

This measure helps with Performance Targets 1, 7, 9A, and 9B.

With PAYD auto insurance, drivers who drive less (and emit less GHG) save money. If humans lived in a rational world that was serious about reducing GHG, PAYD would be one of the first policies to be adopted. PAYD can be characterized as a "no-brainer" climate protection policy. Cost per GHG ton reduced is essentially \$0 - demand reduction policies tend to be extremely cost-effective. 13 states have included PAYD in their Climate Action Plans

California's auto insurance market is constrained by Proposition 103. Other states can implement a larger range of insurance policies, whereas CA pursues public policy consumer fairness objectives such as limiting redlining. CA Department of Insurance allows insurers to offer PAYD policies, but GHG reduction from such policies to date has been small.

For other states, PAYD can cut personal auto driving GHG and VMT (vehicle miles traveled) by 8%. Under Proposition 103, CA PAYD can cut GHG and VMT by 3.2%, providing the equivalent motivation to drive less as a \$0.70/gallon gas tax increase. State Farm's CA "Drive Safe and Save" PAYD policy achieves this 3.2% GHG reduction. The State Farm policy can be characterized as "modest flavor" PAYD. AAA (Auto Club of SoCal) has a "weak flavor" CA PAYD-like policy that produces minimal GHG reduction. 3.2% CA personal auto driving reduction calculates to 3.7 billion less VMT per year and 1.8 million CO2 tons reduced.

While CA PAYD cannot reduce GHG as much as other states, CA is one of the more aggressive states in adopting climate regulation, providing an opportunity to increase PAYD market penetration ahead of other states. CA Insurance Commissioner Jones is pro-climate and has "sought ideas on how to work with the industry to help protect the environment, diminish climate change, and properly evaluate environmental risks." Jones understands the benefits of PAYD and understands the difference between State Farm (3.2%) and AAA (0%) flavors. It is possible that Jones will advance measures to increase the adoption of modest flavor PAYD.

#### Implementation Details for Modest-Flavor, Proposition-103-compatible CA PAYD:

1. A high mandatory miles rating factor level of 31%, based on a strong actuarial case that a) miles are more correlated to losses than current policies. For example: 32% driver safety record, 31% number of miles driven, with the final 37% distributed between "years driving experience" and the optional factors. 31% provides equivalent driving reduction motivation of a \$0.70 per gallon gas tax increase.

Weak-flavor PAYD, such as offered by the Auto Club, should not be allowed. If a driver reduces annual driving mileage from 12,000 miles to 500 miles, they only save a few dollars.

Modest-flavor PAYD, such as State Farm's CA PAYD, saves drivers \$400 when they reduce annual mileage from 12,000 to 500. Spreadsheet analysis (<http://www.cities21.org/cms/StateFarmPAYD.xls>) shows that State Farm provides driving reduction motivation that would produce between 3.2% and 3.9% CA statewide VMT reduction (equivalent of \$0.70 per gallon gas tax increase).

2. Billing a minimum of 3 times per year. This would be based on a "miles correlation" finding: loss is highly correlated to miles driven, and hence, miles driven must be made more visible to drivers in order to increase safety. While some insurers believe frequent billing is burdensome, other industries bill efficiently 12 times per year. US DOT Connected Vehicle, GM OnStar, and Microsoft/Ford Sync are enabling technologies. Automakers might even testify in favor of the policy.

3. Mandate "verified miles," eliminating estimated miles, based also on the "miles correlation" finding.

4. Require a maximum mileage band of 100 miles (necessary given frequent billing), based also on the "miles correlation" finding.

#### Economic Benefits of PAYD - References

- Brookings Institution's The Hamilton Project, "Pay-As-You-Drive Auto Insurance: A Simple Way to Reduce Driving-Related Harms and Increase Equity." Significant net economic gains ensue from PAYD. [http://www.brookings.edu/~media/Files/rc/papers/2008/07\\_payd\\_bordoffnoel/07\\_payd\\_bordoffnoel.pdf](http://www.brookings.edu/~media/Files/rc/papers/2008/07_payd_bordoffnoel/07_payd_bordoffnoel.pdf)
- "Safe Travels: Evaluating Mobility Management Traffic Safety Impacts" ([www.vtpi.org/safetrav.pdf](http://www.vtpi.org/safetrav.pdf)). This report investigates the safety impacts of mobility management strategies that change how and the

amount people travel. It evaluates the safety impacts of various types of strategies including improvements to alternative modes, pricing reforms and smart growth land use policies. Evidence summarized in this report indicates that per capita traffic crash rates tend to increase with per capita vehicle travel, and mobility management strategies can provide significant safety benefits. This analysis indicates that mobility management is a cost effective traffic safety strategy, and increased safety is one of the largest benefits of mobility management.

**DRIVING PRICING MEASURE 3:**

**TITLE: The 2015 extension of California Cap and Trade to cover “combustion of transportation fuel”**

This measure helps with Performance Targets 1, 9A, and 9B.

Best regards,

- Steve Raney, Cites21, Palo Alto, CA

This letter is submitted as public comment on the Draft Bay Area Plan (State Clearinghouse No. 2012062029).

My name is Daniel G. DeBusschere. I reside in Orinda, CA.

The Draft Bay Area Plan (“PLAN”) which is designed to reduce Green House Gas (“GHG”) emissions completely ignores the requirement for additional BART parking (“PARKING”) and BART Bicycle lockers (“LOCKERS”). ABAG and MTC should run a joint survey of potential BART patrons to find out if additional PARKING and/or LOCKERS would increase the use of BART for transit (in lieu of other means) which would decrease Vehicle Miles Traveled (“VMT”).

Stack and Pack LOCKERS would allow significant leverage in the amount of land used to accommodate a BART patron. A suitable LOCKER would have a bright LED light that signals whether or not the LOCKER is empty or used. An electronic lock that reads CLIPPER cards would allow a person to check in the bicycle along with any weather resistant gear that would be used during inclement weather. ONLY the CLIPPER card that was used to check in the items could be used to open the LOCKER for retrieval and posting an appropriate charge to the CLIPPER account. It would be necessary to provide sheltered cover for the LOCKER as well as the access path to the BART station so that patrons could be sheltered from the weather during transit from the LOCKER to the BART station. Use of the CLIPPER card would allow multiple day rentals for those patrons who might choose BART for airport access and return. Use of the CLIPPER charge would allow electronic accounting of who uses the LOCKER and who is responsible for its contents.

I believe that PARKING and LOCKERS are important to reducing VMT and GHG. Why is such an important area not included in the PLAN? I am including this comment to insure that there is an appropriate placeholder for possible future litigation if ABAG and/or MTC continue to ignore these requirements in any approved PLAN.

Respectfully submitted,

Daniel G. DeBusschere

## **RE: Recommendations on Local and Regional Sustainable Transportation Systems**

Dear Mrs. Clevenger,

Thank you for administering the Sustainable Community Strategy and considering my comments on the Draft Plan Bay Area and its Environmental Impact Report. As a native to the East Bay and educated in Southern California in environmental science and urban planning, my recommendations represent the potential of sustainable regional transportation plan based on a California-wide experience.

There are three strategies working at complementary levels to promote more efficient modes of mobility than single-occupancy car driving that receive little or no attention in Plan Bay Area.

- 1) Complete regional bicycle networks**
- 2) Official casual carpool systems**
- 3) Highway bus rapid transit (BRT) system**

Combined with existing efforts outlined in Plan Bay Area, implementing the following recommendations will help achieve the region's long-term emission reduction targets and other important goals.

### **Complete Regional Bicycle Network**

The Plan falls short in expressing a coordinated strategy for creating a region-wide bicycle network. The benefits of bicycling go beyond reducing the amount of transportation-related green house gas emissions for short-distance trips, but can also be seen in supporting local economies, healthier populations, and lower costs for road improvements.

The Plan must identify a suite of strategies to assist cities and counties in planning, prioritizing and funding bicycle lane development. These strategies should conform to a regional bicycle master plan that identifies primary bicycle routes that effectively connect neighborhoods, retail, transit and job centers. Maps of these primary bicycle routes should be highlighted in Plan Bay Area. The San Francisco Bay Trail is a specific example that highlights this effort, though more coordinated planning is necessary between cities and counties to create a 9-county primary bicycle network. Plan Bay Area should set forward this coordinated bicycle network implementation.

### **Official Casual Carpool System**

Carpooling remains a low-cost approach to the efficient use of limited highway space with minimal infrastructure investment. For decades, the Bay Area has utilized informal casual carpool locations to pick up individuals headed in a common direction, downtown San Francisco.

With the advent of High Occupancy or Toll (HOT) Lanes, the casual carpool system holds the promise to expand its efficient use of automobile space with proper regional coordination. The

requirement for HOT lane access should require both a minimum number of carpoolers as well as toll for cars falling below the minimum number of riders. As these tolls and carpool requirements vary with congestion levels, it can provide incentive for drivers to pick up passengers heading in the same direction for faster travel along congested HOT Lane routes. Strategically located, these casual carpool locations can be placed adjacent to public transit facilities to offer travellers a choice between carpooling or public transportation. Through examining common commuter and traveller routes, the casual carpool system can move beyond a strictly San Francisco

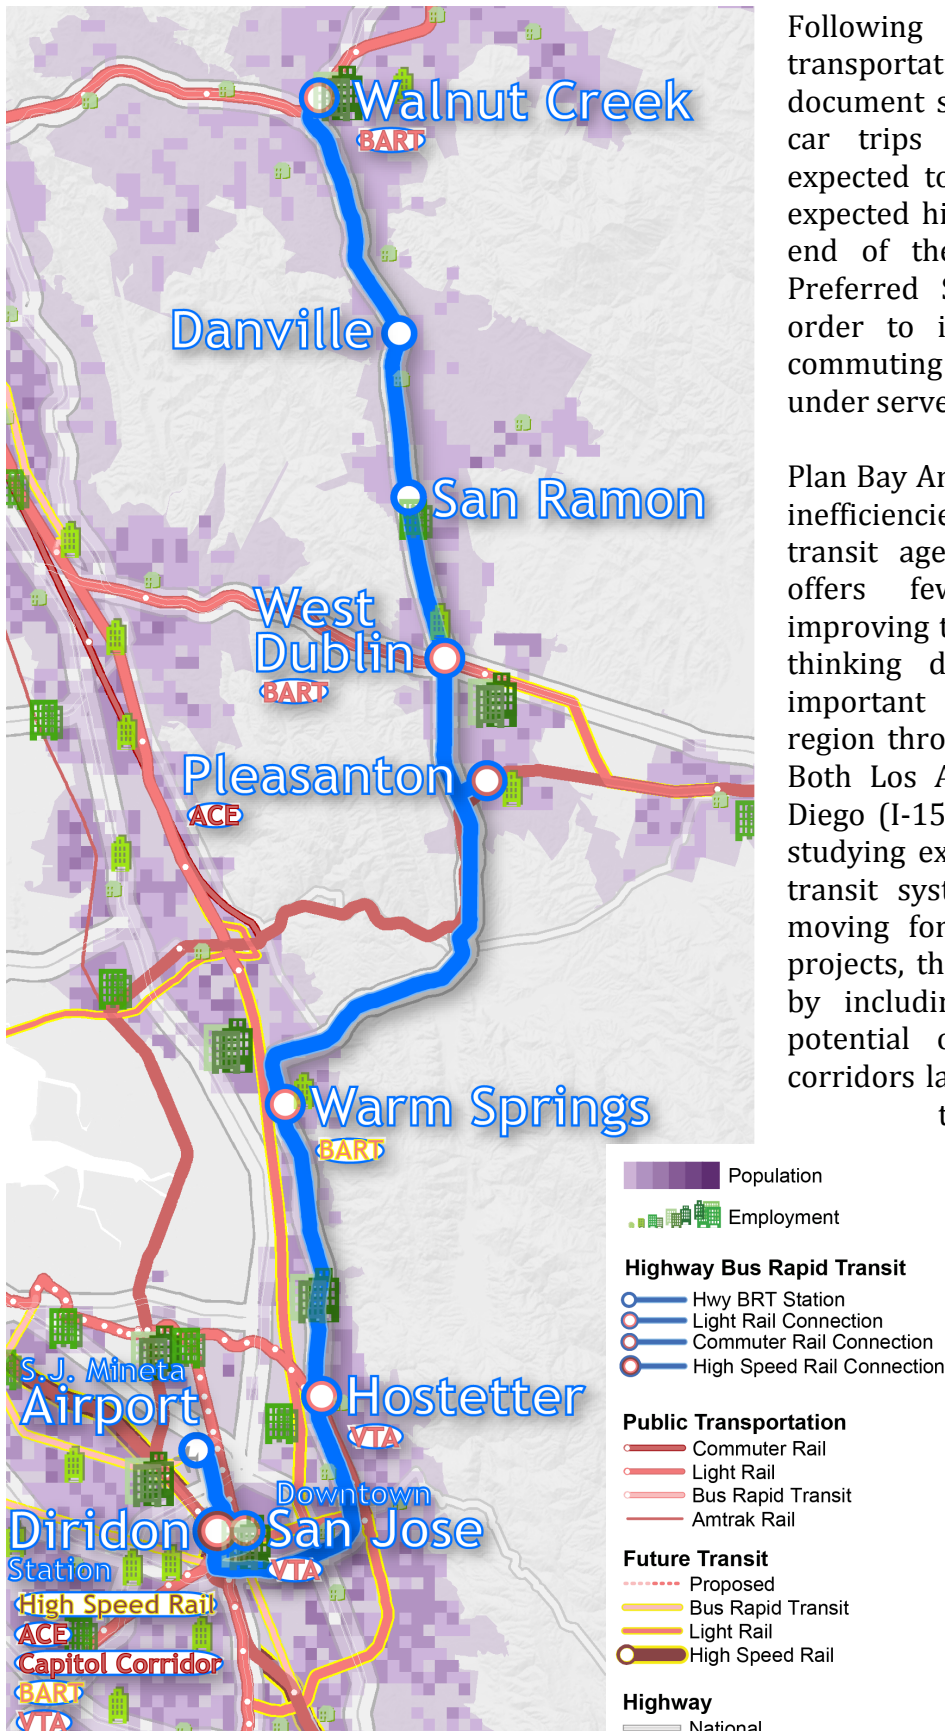

focused model and include other common travel routes.

Plan Bay Area should outline a program to expand the Casual Carpool system in coordination with the expanding HOT lane development. This recommendation could be included in the section Alternative Transportation Suggestions.

### **Highway Bus Rapid Transit**

The Plan Bay Area requires a more robust analysis of the commuting and travel patterns for people moving within and from outside of the Bay Area. Forward thinking strategies that can help the region meet its targets for green house gas reduction should accompany this analysis.

## I-680 Highway Bus Rapid Transit

Following an assessment of existing transportation investment resources, this document should estimate the number of car trips a public transit project is expected to reduce on the highway. The expected highway congestion rates at the end of the projects completed in the Preferred Scenario should be listed in order to identify those most common commuting and travelling routes currently under served by public transit.

Plan Bay Area falls short in addressing the inefficiencies of operating thirty-three transit agencies within the region and offers few policy suggestions for improving transit ridership. This forward-thinking document should include an important strategy for connecting the region through its vast highway network. Both Los Angeles (Silver Line) and San Diego (I-15 Corridor) are running and or studying expansion of highway bus rapid transit systems. While the Bay Area is moving forward with local-serving BRT projects, the region would greatly benefit by including a proposal to study the potential of a BRT system in travel corridors lacking public transit, as well as the possibility of linking such a system to connect all 9 Bay Area Counties.

This study proposal should be included in the section Alternative Transportation Suggestions. Its evaluation would incorporate underserved public transit corridors with high congestion levels, identify major job centers and neighborhoods underserved by regional transportation, as well as potential rapid

transit connections. An initial study corridor could be implemented where HOT Lane development is already in place, along the I-680 corridor from San Jose to Walnut Creek, and potentially to Napa. Such a bus line would run along the center lane of I-680 giving priority to buses at peak commute hour and include stations integrated in-line with and elevated above the highway. This I-680 BRT corridor could connect travellers with Diridon Station, intersecting BART and ACE lines as well as job and destination centers in San Ramon and other cities along the route (see Appendix or [www.thehotexpress.com](http://www.thehotexpress.com)). If proven safe and successful, such a model could expand throughout the Bay Area to create a single transit system connecting all corners of the region.

### **Missed Targets**

The following targets of Plan Bay Area are either missed or move in the opposite direction of the Plan's stated goals. These goals could potentially be met by expanding on the suggestions listed above.

**Target #4: Reduce by 50 percent the number of injuries and fatalities from all collisions (including bike and pedestrian).** *Plan moves in opposite direction from target; injury and fatality collisions are projected to increase during plan period by 18 percent.*

A coordinated regional bicycle network plan could bring greater safety and awareness to drivers, bicyclists and pedestrians through clearly marked and protected bicycle lanes.

---

**Target #5: Increase the average daily time walking or biking per person for transportation by 70 percent (for an average of 15 minutes per person per day).** *Plan boosts per-person active transportation by 17 percent, but falls short of target.*

Providing safe bicycle paths to and from neighborhoods, jobs, retail and transit stops can help increase the average biking time for a wide variety of users. A coordinated regional effort would go further to create connections rather than individual city and county plans.

---

**Target #7: Decrease by 10 percentage points (to 56 percent, from 66 percent) the share of low-income and lower-middle income residents' household income consumed by transportation and housing.** *Plan moves in wrong direction; the share of household income needed to cover transportation and housing costs is projected to rise by 3 percentage points to 69 percent for low-income and lower-middle income residents during the Plan Bay Area period.*

Expanding highway bus rapid transit to new communities can help provide greater public transit connections that would reduce automobile use, while casual carpooling can also reduce the costs of car ownership and operation.

---

**Target #9a: Increase non-auto mode share by 10 percentage points (to 26 percent of trips).** *Plan boosts non-auto mode share to 20 percent of trips, but falls short of target.*

**Target #9b: Decrease automobile vehicle miles traveled (VMT) per capita by 10 percent.** *Plan reduces VMT per capita by 9 percent, but falls short of target.*

Advancing alternatives to single occupancy driving should be more ambitious than the listed targets. Combining strategies for an expanded bicycle network, casual carpool opportunities and new public rapid transit routes will help bring down non-auto mode and VMT per capita beyond the existing plans.

---

**Target #10a: Increase local road pavement condition index (PCI) to 75 or better.** *Plan improves pavement condition of local roads to a PCI of 68, but falls short of target.*

**Target #10b: Decrease distressed lane-miles of state highways to less than 10 percent of total lane-miles.** *Plan moves in opposite direction from target; the percentage of distressed state highway lane-miles in the region will rise to 44 percent of the regional highway system by year 2040.*

Moving people from their own cars to bicycles, trains, buses and other people's cars will have an overall reduced rate of impact on the road pavement and highways. Combining strategies for an expanded bicycle network, casual carpool opportunities and new public rapid transit routes will help bring down impact of single occupant vehicles on road pavement beyond the existing plans.

Thank you for considering these recommendations for a sustainable Bay Area.

Sincerely,

Adam Garcia

## Comments about the One Bay Area Plan

C205-1

- It mandates growth but does not help pay for the infrastructure to support growth: A) roads B) Sewer C) Schools D) Water E) Transportation that low income people can afford- instead GG Transit is cutting bus lines
- The so- called 'One Bay Area Plan' subverts local control. It is being foisted on us by ABAG, MTC and local officials and is yet another giveaway to big developers.
- So-called affordable housing does not remain affordable because after a number of years it is allowed to be sold at market value.
- At this time Fairfax is at gridlock several times/day, yet we are slated under this plan for 280 new 'units' -how many people/with cars/unit unknown.
- According to a study the MBC, 50 % of the traffic coming through Fairfax at commute times is from Novato- I am assuming that that traffic diversion will only increase as you increase housing density San Rafael, north.
- I support increasing workforce housing but oppose giveaways to developers who will make huge profits, while local communities can only look on as local rights are eroded. In 4 years, ABAG- an unelected body, will 'revisit' these numbers- and so far, they have always demanded increase of numbers. ABAG reminds me of a greedy ravenous monster, whose belly is never full.

- Fairfax, has been compared to the Oakland Hills in terms of fire danger- narrow windy roads with a fire load that increases by the year. If a fire were to start, during a traffic standstill, how would people get out of town? We cannot provide safe exits to people at the current population density. Locally, we are worried about them getting out at ANY time!

- I know that CALTRANS has had plans on the books for a 4 lane highway from San Rafael to Point Reyes. When we reach total gridlock, which this housing infill plan will bring us to, we will have no choice but to destroy yet another facet of our small town life. I speak about Fairfax, but every town is slated for more housing in Marin.

C205-1.5

- 25 % of housing is slated to be built in toxic sites.
- Why locate marginalized communities in areas that are more polluted and toxic when they have fewer health resources?

C205-2

- There is a massive push towards geoengineering to meet our water needs at the national level, and, on top of this insanity, this plan will open the floodgates locally for MMWD's multi-million dollar desal plant (with intake next to a sewer outlet, a bay so polluted with pesticides, herbicides, toxic metals, pharmaceuticals etc. that fisherman are advised not to fish out of it, nor people to swim in it- a project which our struggling residents, towns and infrastructure can ill afford in a failing economy.

C205-3

- We cannot accept the parameters offered by this 'plan'. There needs to be more public meetings and a mechanism for public debate- the way Kinsey handled the one at the civic center was atrocious- his pro- plan people were lined up and allowed 3 minutes/speaker- not much time, granted, but when it came to those who opposed the plan, we were limited to 1-2 minutes. That is NOT public input.
- Kinsey needs to back off from accusing those who oppose the plan of racism.
- I do not believe that it is a plan to afford 'affordable' housing- I believe that it is a backdoor to subvert local governments deciding how and where they allow new housing.

- We do need workforce housing -let's find a way to subsidize it and cut out the middlemen- let's make local policy- town by town to meet local needs, and-if we are going to spend millions, let's have a public discussion. Many of them.
- This plan should go to the electorate for a vote. But the 'One Bay Area' planners must not be allowed to control the ballot language. It must be put together by a group from all sides.

May 11, 2013

C206 Dear Metropolitan Transportation Commission:

As a long time resident and property owner, I am greatly concerned with the recent expansion and developments in Marin County.

I read the article in the Marin IJ Sunday May 5 and the expressed desire to identify PDA's near the SMART train hubs.

I am in support of the SMART train project if it can be done within reasonable economic parameters. I am surprised to learn the county is considering large numbers of additional housing near the planned hubs. The SMART train is supposed to reduce traffic; increasing housing by the numbers published in the Sunday May 5 Independent Journal Article defeats that intention. Walk routes, Biking and bus transit to the proposed hubs is the way to go.

I encourage you not to develop these few areas; they represent what distinguishes Marin county from many other bay area counties. The urban sprawl needs to stop, Marin has resisted it for many years and needs to maintain "green zones" of no development, and cluster housing elsewhere, where there is current development which could be demolished. I would suggest there are lots of small shopping locations which could be utilized more efficiently.

Please do not develop the Marinwood, Tamapalais Valley, Strawberry/marin City area. These are part of the splendor of the county, and serve to maintain our economic & green values well. WE are not in San Jose with its urban sprawl, and live in Marin by choice.

Please preserve the county and refuse housing developments in these areas.

Respectfully submitted,

  
Jane Hook  

Sausalito, CA 94965

**Subject:** Draft Plan Bay Area EIR Comments

Dear Commissioners,

Friends of Caltrain is a grassroots advocacy group supporting environmentally and economically sustainable transit in the Peninsula Corridor. We are very glad to see the region work to coordinate transit and land use in the interest of reducing greenhouse gas emissions.

In the proposed plan, we are concerned about the proposed Express Lane Network. As proposed, the Network will continue the cycle of “build more lanes, attract more drivers” by pumping all revenue back into new highway lanes, without adding more transportation choices or addressing the potential impacts to low-income travelers.

To address this concern, the MTC should

- Optimize existing lanes instead of just building more highway, and use the savings to pay for more public transportation choices.
- Ensure that with the opening of every new HOT lane, there will be a simultaneous improvement in transportation choices – including transit and vanpools – along the same corridor, over and above existing transit service and paid for by a combination of net revenues from the HOT system and new revenues from other sources.
- Substantially increase funding for transit operations.

Transportation produces a major share of the region's greenhouse gas emissions. Therefore we encourage you to adopt these strategies that will provide better climate protection results.

Sincerely,

Adina Levin  
Friends of Caltrain

I am informed and want Plan Bay Area stopped.

C209-1

There must be a VOTE by the public. The stealth, undemocratic development of the PBA infrastructure tentacles is appalling to those who have happened to discover what has already been developed under the guise of 375/32 compliance.

One problem is the number of young "green graduates" with fake "degrees" who must make the false premise of their "expertise" believable. Another is the social re-engineering goal. It has never worked & will not now.

This PBA nonsense is "UN-SUSTAINABLE". We will not let you ruin our great country. Get into honorable work before your jobs disappear as more citizens become aware of your sneaky endeavor.

Regionalism sucks.

**Subject:** Zoning Changes

Please do not change the existing zoning for Marinwood/Lucas Valley. We are a suburban community adjacent to rural/open space areas. Increased zoning allows for urban development that simply doesn't make sense for our community.

High density multi story buildings in the middle of suburban open space tracts would not only be unsightly, but also there is no infrastructure in place to support these types of developments. The community is already experiencing excessive traffic congestion during commute times. The schools are already overcrowded and the community services district struggles with funding.

Thank you, Kim Mollenauer

My biggest concern over any future development in our area is that new housing contribute toward ALL property taxes, not just the parcel taxes. The base tax contributions are necessary to support the Dixie School District and the Marinwood Community Services District. To give developers 55 year tax exemption status is unconscionable because it places undue burden on existing homeowners, many of whom are already stretched with exorbitant property taxes. A one time impact assessment is not sufficient to cover costs to the community over the next 55 years.  
Please consider only development for Marinwood Plaza that fully contributes to our tax base.  
Thank you, Kim Mollenauer

Hello - I'll be the first to admit that I know very little about the "Plan Bay Area" (PBA). From what I read below my thoughts are:

C212-1

1. More transparency is needed on the initiative
2. Sausalito may already have higher density than other parts of Marin and this should be accounted for when making decision

Regards,  
Dan

Questions: Councilmember Linda Pfeifer, [REDACTED] [REDACTED]

[sausalito urban growth]
Proposed High Density Growth

The new "Plan Bay Area" (PBA) state initiative is proposing increased high density housing throughout Marin County.

A large amount of this growth would be targeted in Marin City and Strawberry. There appear to be a few tiny pockets within Sausalito as well, given the small black dots on the map at left. However, I am unclear as to its extent. The transparency for this has been abysmal.

If implemented, Plan Bay Area would greatly impact Sausalito's fragile eco-system and wild life. Marin City and Sausalito both border the Golden Gate National Recreation Area, home to several Endangered Species.

"Plan Bay Area" (PBA) says it is "eco-friendly" urban growth that stops suburban sprawl by redirecting high density housing developments along major transportation corridors.

But Sausalito has no "suburban" sprawl. We have one of the highest densities in Marin County. I believe Plan Bay Area's "one-size-fits-all" planning is wrong and hurts the environment by placing yet more unacceptable strain on our sewers and roads.

Sausalito, Marin City and [marin city growth] Tam Junction border sensitive eco-habitats. High density in these areas would seriously impact

Plan Bay Area 2040 Final Environmental Impact Report

wildlife, increase pollution, and generate unacceptable traffic bottlenecks for Sausalito and throughout Southern Marin.

The map to your right illustrates the "Priority Development Area" (PDA) geographies targeted, colored in blue. I would hate to live in Northern Sausalito when Plan Bay Area is implemented, as the congestion in Marin City will greatly impact our northern areas.

Sausalito's Housing Element

Plan Bay Area (the implementation of SB375) was the reason Sausalito's Housing Element placed high density housing along our main transportation corridor, e.g., Bridgeway (Northern Sausalito) and Second Street (Hurricane Gulch). It is a main reason I voted against Sausalito's Housing Element. The inadequate Neg Dec that replaced what should have been a full EIR (Environmental Impact Report) for Sausalito's Housing Element was a sorry legacy. Now, an inadequate EIR is being presented for Plan Bay Area as well.

No Transparency

I am appalled at the lack of transparency that Plan Bay Area has received. Most residents know nothing about these pending plans for explosive future growth. The whole process reminds me of the pension crisis, where past decisions have left us with a major financial crisis. Plan Bay Area, in my opinion, lays the foundation for a future high density crisis in our area. In my opinion, it is forced urbanization wrapped in an eco-spin.

Resident Options

Whether you like or dislike Plan Bay Area, please participate in the democratic process. I cannot stress enough the importance of your comments on the EIR, because the State MUST consider your input in their decision.

1) Attend Monday's Public Hearing:

- * What: Plan Bay Area Public Hearing for Marin
- * When: THIS Monday, April 29
- * Where: Marin Center, 10 Avenue of the Flags, San Rafael (map)
- * Details: The open house will run from 6 p.m. to 7:30 p.m. The public hearing will run from 7 p.m. to 9 p.m.

2) Write a letter to: MTC-ABAG Public Comment, Draft EIR - Plan Bay Area, 101 8th Street, Oakland, CA 94607

MTC-ABAG Plan Bay Area Public Comment
101 8th Street Oakland,
California 94607

**Re: Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft
Environmental Impact Report**

I write on behalf of Quiet and Safe San Rafael and myself to comment on the Draft Plan Bay Area and Draft Plan Bay Area Draft Environmental Impact Report (State Clearinghouse No. 2012062029).

Quiet and Safe San Rafael is a group of residents in North San Rafael from 10 neighborhoods which number over 4,700 households and 9,000 residents. We have come together out of concerns arising from the planning of the North San Rafael / Civic Center Primary Development Area. After hundreds of conversations and dozens of meetings that have occurred since September 2012, it is clear that this plan does not reflect the views of hundreds, if not thousands of residents.

We hope that you consider this letter very carefully. This letter identifies potentially serious issues that now documented and on the record, if left unaddressed by the plan may present liability and legal issues. Given the number and severity of the issues it seems unrealistic that the plan timetable of certifying a final valid EIR and adoption of a plan can occur by June as stated in the schedule update published November 9th 2012 and an extension of this timeline by six months at a minimum should occur.

1. Plan Fails to Present Valid, Substantiated and Measurable Rationale

To ensure accountability and defensibility the plan must be based on the following rational process, such as developed by the Bureau of Public Roads in 1963. The analysis on page 122 of the Draft Bay Area Plan lines up as follows with such a rational process:

- a) **Requirement:** Quantitative output criteria by which the plan, and alternatives can be judged
Issue with Plan: Multiple goals are invalid (detailed below)
- b) **Requirement:** Accurate presentation of travel needs, preferences and behaviors
Issue with Plan: The plan, and it's proposed allocation of discretionary transportation

expenditures¹, does not reflect that car and light truck are the preferred methods of transit of most residents

C214-3

c) **Requirement:** Project rankings in terms of cost per each criteria-related benefit

Issue with Plan: Scores are based on flawed assumptions where causality is not accurately substantiated (land use and transit preference, subsidization of specific housing types and development and rental or sale of that housing type), and peer-reviewed reports are not considered (e.g. impact of proximity to freeways and transit on health²).

Furthermore the plan does not weight the scores of specific targets, or if it does so clearly identify the weighting given (Table 4 on page 116). If no weighting was deemed necessary this is not explained. It seems unrealistic that all targets are given equal weightings.

C214-4

d) **Requirement:** Alternatives that consist of collections of potential projects

Issue with Plan: Alternatives are not presented that adequately reflect that car and light truck are the preferred methods of transit of most residents³. For instance, there is no alternative that has a highway emphasis. There is no transparency into additional alternatives considered (if any were considered).

The plan identifies that the “no project” alternative is projected to reduce passenger vehicles (presumed to mean cars and light trucks) CO₂ emissions by 23% over the existing condition in 2010. The preferred alternative which is costly and intrusive into basic economic and personal freedoms is projected to reduce emissions by 25%. The plan does not consider if this extra 2% is worth all of the costs.⁴

MTCO ₂ E Comparative Emissions	Existing Condition 2010	Alternative 1 - No Project	Alternative 2 - Proposed Plan
Pass Vehicles	19,383,000	14,970,000	14,631,000
%Change from Existing		-23%	-25%
Difference Between Plans 1 and 2			-2%

C214-5

The plan also presents an apparent inconsistency where Table 3.1.29 in the Draft EIR shows marked differences when compared to Draft Plan Bay Area. In the Draft Plan Bay Area the reductions in per capita CO₂ emissions appear to reflect exaggerated benefits for the proposed plan, when compared to the MTCO₂ emissions from the equivalent table in the Draft EIR (Table 3.1-29).

MTCO ₂ E Comparative Emissions	Existing Condition 2010	Alternative 1 - No Project	Alternative 2 - Proposed Plan
Pass Vehicles (Draft EIR Table 3.1-29)	19,383,000	14,970,000	14,631,000

¹ Draft Plan Bay Area, Page 12, Figure 2 “Plan Bay Area – Discretionary Investment Summary”

² Environmental Health Perspectives, a peer-reviewed journal:

http://www.huffingtonpost.com/2013/03/12/autism-pollution-study- n_2853542.html

³ Draft plan page 21, “Alternatives to Visioning Scenarios”

⁴ Draft EIR, Table 3.1-29, Comparative Annual Land Use GHG Emissions

%Change from Existing (Draft EIR Table 3.1-29)			-23%	-25%
%Change from Target Analysis, Page 116, row 1, Draft Plan Bay Area			-8%	-18%

The plan makes no effort to measure these costs, and address this question.

- C214-6** e) **Requirement:** Estimates of financial costs and the transportation, environmental and other benefits of each alternative
Issue with Plan: Transit CO₂ and diesel particulate emissions known to exceed car and light truck emissions⁵ per passenger mile are not accurately considered⁶.
- C214-7** f) **Requirement:** A preferred alternative that proposes a list of projects in an attempt to balance the various criteria
Issue with Plan: While a preferred alternative is proposed, the criteria by which this is identified flawed (see below).
- C214-8** g) **Requirement:** Monitoring to ensure the plan is working as intended with feedback mechanisms that add or subtract projects if more money becomes available or if certain assumptions prove wrong.
Issue with Plan: Insufficient evidence of historic causality and sensitivity analysis demonstrating indications that such monitoring is unlikely.
- C214-9** The lack of adherence to a rational approach, and consequent lack of defensibility means the EIR is inadequate.
- C214-10** Furthermore it means that the public, elected officials and ABAG and MTC representatives voting on the plan do not have the information to make an informed decision or provide effective feedback.

⁵ Based on Obama's fuel-efficiency standards:

<http://www.whitehouse.gov/blog/2011/07/29/president-obama-announces-new-fuel-economy-standards>

...the average car on the road in 2025 will use about two-thirds as much energy per vehicle mile as the average car today. This is based on the assumptions that new cars in 2025 will get the prescribed average 54.5 mpg; they will improve on a straight line between now and then; and the U.S. vehicle fleet will turn over at the rate of one-eighteenth every year, which is about the historic rate.

⁶ Critique by Mass Transit Consultant Tom Rubin on "Public Transit Buses: A Green Choice Gets Greener"

<http://reason.org/news/show/does-bus-transit-reduce-greenhouse>

"Environmental assessment of passenger transportation should include infrastructure and supply chains" by researchers at UC Berkeley:

http://iopscience.iop.org/1748-9326/4/2/024008/pdf/1748-9326_4_2_024008.pdf

This report concludes that the complete life-cycle energy costs of rail transit are 255 percent of the operating costs, while highway transportation is only 163 percent of the operating costs.

Randal O'Toole, *Does Rail Transit Save Energy or Reduce Greenhouse Gas Emission?* Cato Institute, Policy Analysis 615, April 14, 2008:http://www.cato.org/pub_display.php?pub_id=9325

C214-11 | The plan follows requirements set by Senate Bill 375⁷ which set targets of reducing CO2 emissions for cars and light trucks but not for transit. Instead of following SB375 at great cost, without question, and potentially with little or no effect the plan should serve as a shining example of leadership progressing reform of SB375.

Questions:

C214-12 | **Q1:** How does the plan adhere to a rational planning process?

C214-13 | **Q2:** Why do the MTCO2 emissions figures in table 3.1-29 of the Draft EIR for passenger vehicles which show alternative 1- no project would reduce emissions by 23% and alternative 2- proposed plan reduce emissions by 25%, when table 4 in Draft Bay Area Plan page 116 show that alternative 1 would reduce emissions by 8% and alternative 2 by 18%?

C214-14 | **2. Plan Invalidly Proposes Goal of “Increase Non-Auto Mode Share by 10 Percentage Points” and “Decrease Automobile Miles Traveled (VMT) Per Capita”⁸**

(Transportation System Effectiveness, Goal #9a and 9b)

The plan incorrectly represents these potential strategies as goals. Reducing total CO2 emissions (regardless of transit mode) is a valid and noble goal to help prevent climate change. However by imposing a bias towards transit the plan potentially increases total CO2 emissions, but this is masked from consideration leading to invalid conclusions. All alternatives include disproportionately high transit investments and low highway investments, there is no alternative presented with higher discretionary spending in highway investments.

Furthermore the model, and the alternatives presented, do not incorporate consideration that cars and light trucks emit more CO2 in congestion. This underscores the value of a strategy of reducing congestion not considered by the plan.

Trains in Austin, San Diego, and other cities – which have operational lifespans of 30 years – produce as much or more CO2 emissions per passenger mile than the average car in 2025⁹. Golden Gate Ferry’s CO2 is three times worse than cars, and Marin and Sonoma county buses

⁷ Draft Plan Bay Area, Page 2, A Legacy of Leadership “Among the new challenges are the requirements of California’s landmark 2008 climate law (SB 375, Steinberg): to decrease greenhouse gas emissions from cars and light trucks”. Page 3 “California Senate Bill 375: Linking Regional Plans to State Greenhouse Gas Reduction Costs”

⁸ Draft Plan Bay Area, Page 19, Table 1: “Adopted Plan Bay Area Performance Targets”

⁹ Critique by Mass Transit Consultant Tom Rubin on “Public Transit Buses: A Green Choice Gets Greener” to trains instead of buses:

<http://reason.org/news/show/does-bus-transit-reduce-greenhouse>

Randal O’Toole, *Does Rail Transit Save Energy or Reduce Greenhouse Gas Emission?* Cato Institute, Policy Analysis 615, April 14, 2008: http://www.cato.org/pub_display.php?pub_id=9325

“Environmental assessment of passenger transportation should include infrastructure and supply chains” by researchers at UC Berkeley:

http://iopscience.iop.org/1748-9326/4/2/024008/pdf/1748-9326_4_2_024008.pdf

This report concludes that the complete life-cycle energy costs of rail transit are 255 percent of the operating costs, while highway transportation is only 163 percent of the operating costs.

are also as bad as or worse than cars.

Such a goal causes an over-emphasis on modes of transport that are not practical for many residents. For instance, many Moms and Dads (of which I am one) need to drop off their kids at schools over 1 mile away on their way to work. It is unrealistic for them to switch modes to walk, bike or take transit which may make their school drop off and commute time prohibitive. It is not reasonable to expect these residents to sell their homes (costing 7% sales commission, after a potential drop in property value) and move to smaller homes without yards near transit.

Furthermore this invalid goal serves to needlessly increase transit time per mile travelled, and reduce commute radiuses which has other significant adverse impacts covered elsewhere in this letter.

Questions:

- C214-15** | **Q3:** Why does the plan not specify that “Increase Non-Auto Mode Share by 10 Percentage Points” and “Decrease Automobile Miles Traveled (VMT) Per Capita” are targets and not strategies to achieve targets?
- C214-16** | **Q4:** Does the plan identify CO2 emissions of transit based on actual/current ridership levels?
- C214-17** | **Q5:** Why doesn’t the plan assess and state CO2 emissions per passenger mile of BART, Golden Gate Transit buses and ferries, MUNI buses, VTA light rail?
- C214-18** | **Q6:** Why does the plan not recognize that many residents cannot practically commute via transit, walking or biking? (E.g. dropping kids at school, picking up groceries)
- C214-19** | **Q7:** Why does the plan not recognize that many non-commute trips cannot be performed via transit, walking or biking? (E.g. buying furniture, heavy goods, conducting a journey with many stop-off points, residents who are disabled/older unable to walk long distances, connection times and commute times make travel time prohibitively long)

C214-20

3. Plan Excludes a Critical Target of Reducing or Minimizing Reduction of Travel Time

The plan under-represents a critical aspect of transit planning – reducing average travel time (regardless of mode of transit). Travel time is critical for a number of reasons:

- a) It directly affects commute radius. This particularly hurts low income residents who are less able to find jobs.
 - b) It affects the available talent pool for businesses
 - c) If cities on the periphery fall out of the commute radius they may go into economic decline; for instance Novato, Salinas, Saratoga, Fairfield and Vallejo are all on the periphery. Many have stretched commute and budget to afford single family homes in these locations. If out of practical commute range for cars (and for many dropping off kids this may be the only practical mode) these communities will have a drop in quality of life and property values.
 - d) It makes the Bay Area enjoyable and attractive to live in for existing and new residents
- Instead the plan over-emphasizes goals that are prescriptive strategies such as requiring and encouraging particular modes of transit and land use. This focus on strategies and omission of a

key goal is a major plan oversight.

The plan does not appear to place a value (money, time wasted, employment, talent pool availability), or a score relating to reducing congestion and reducing travel time.

Had congestion relief, and travel time been taken into consideration (together with additional pertinent alternatives) the plan would not have arrived at the same conclusion.

Questions:

C214-21

Q8: Why is reducing average travel time, regardless of mode of transit, not a goal with appropriate weighting?

C214-22

Q9: Why does the plan not take into consideration commute radiuses, where this recognize recognizes that there are many cases where commutes rely through preference or constraints on car or light truck transit?

C214-23

Q10: Why does the plan not provide adequate consideration of the impact of reduced commute radiuses? (E.g. if a town is removed from effective car and light truck commute radius this may have significant economic effects)

C214-24

Q11: Why does the plan discriminate between different transit modes? (E.g. why not focus on commute or travel time?)

C214-25

Q12: Why does the plan not take into consideration the importance of reducing congestion for the reasons stated above (pollution, reduced commute radius, wasted money...)?

C214-26

4. Plan Invalidly Defines Increasing Average Daily Time Walking or Biking per Person by 70 Percent As a Goal, When It Should Be a Strategy (Healthy and Safe Communities, Goal #5)

The actual goal should be minimizing transit time. This invalid goal needlessly skews scoring and resulting investments away from cars and light trucks.

Questions:

Q13: Why is increasing average daily time walking or biking a goal, when it should be a strategy?

C214-27

5. Plan Invalidly Defines Reducing Per-Capita CO2 Emissions from Cars and Light Duty Trucks by 15 Percent (Climate Protection, Goal #1)

The plan is based on California Senate Bill 375 which requires a reduction of greenhouse gas emissions only from cars and light trucks, excluding transit from consideration. However both the Plan, and the Senate Bill are questionable and the assumptions behind this should be questioned and reviewed.

The goal that is set is invalid and likely to result in a net increase in CO2 as when correctly

calculated car emissions¹⁰ are below that of transit¹¹. Alternatively significant public expenditure may be performed that does not reduce CO₂, or that achieves a small reduction of CO₂ when the same expenditures could achieve an exponentially greater reduction via other methods—such alternatives were not considered by the plan, such as:

- subsidization of building insulation to reduce electricity generation for HVAC
- focusing on expenditures reducing vehicle congestion and CO₂ emissions
- encouraging development of lighter weight vehicles

These are just three of many other possible ways of reducing CO₂ at far less cost, with much higher likelihood of success than the plan.

Questions:

C214-28

Q14: Why does the plan not set a leadership role and propose reducing all CO₂ emissions for transportation, as the plan over-emphasizes CO₂ emissions by transit costing significant amounts yet not achieving the intended true goal?

C214-29

Q15: Why did the plan, and ABAG staff and MTC, not question and evaluate the logic of Senate Bill 375's over-emphasis on CO₂ emissions by cars and light trucks?

C214-30

6. Plan Invalidly Defines Multi-Modal Transit as a Goal

Multi-modal transit is not a goal but a tactic of achieving a goal such as CO₂ reduction. It presumes that users want to have options and needlessly diverts billions of dollars to present choices that may not be adopted (and in many cases history has proven out will not be adopted). There is no assessment of causality that simply providing these other modes, at not inconsiderable expense, will cause them to be adopted, and adopted sufficiently to justify the investment and reduce passenger mile emissions. There is no sensitivity analysis in the plan to back up this causality. This target or goal is invalid.

Questions:

Q16: Why does the plan set multi-modal transit as a goal when it should be a strategy?

Q17: How does the plan assess that if multi-modal transit is provided users will switch to taking it, what sensitivity analysis is conducted or referenced to validate that the expenditures on multi-modal transit will lead to usage and desired benefits?

¹⁰ Based on Obama's fuel-efficiency standards, the average car on the road in 2025 will use about two-thirds as much energy per vehicle mile as the average car today. This is based on the assumptions that new cars in 2025 will get the prescribed average 54.5 mpg; they will improve on a straight line between now and then; and the U.S. vehicle fleet will turn over at the rate of one-eighteenth every year, which is about the historic rate.

¹¹ Randal O'Toole, *Does Rail Transit Save Energy or Reduce Greenhouse Gas Emission?* Cato Institute, Policy Analysis 615, April 14, 2008:http://www.cato.org/pub_display.php?pub_id=9325
Reason.org: Does Bus Transit Reduce Greenhouse Gas Emissions, April 5, 2010
<http://reason.org/news/show/does-bus-transit-reduce-greenhouse>

C214-31

7. Plan Does Not Sufficiently Consider that Traffic Congestion Adds to CO₂, Reduces Commute Radius

The plan does not present adequate consideration that the lack of investment and expansion of the road network will cause an increase in traffic congestion – instead the methodology results in an over-emphasis on transit. As a consequence congestion needlessly increases, and the resulting standing or slow traffic will cause additional CO₂ emissions per passenger mile for the most used form of transit – cars and light trucks.

Furthermore the plan does not adequately take into consideration the impact of the time wasted from traffic congestion in a number of ways:

- a) A reduction in the distance that most residents (most residents do not use transit) can effectively commute. This in turn means that people are less able to find employment. This hurts low income groups the hardest.
- b) The reduction in commute distance for this majority that use cars and light trucks means that employers cannot draw from such a large talent pool, reducing the Bay Area's competitiveness
- c) Inconvenience and frustration

Questions:

Q18: How does the plan effectively assess proportionate investment in maintenance and expansion of highways and freeways?

Q19: How does the plan assess CO₂ emissions caused by congestion?

Q20: How does the plan assess that congestion reduces commute radius, especially given that cars and light trucks are the preferred and often only practical mode of transportation?

C214-32

8. Plan Does Not Accurately Represent that Cars and Light Trucks are Residents Preferred Form of Transit (Based on Activity Not Survey Preference)

In 2011, 15.6% of San Francisco Metropolitan Statistical Area commuters used transit. The plan does not invest discretionary funds proportionate to the populations preferred mode of transit and over-commits discretionary funding to transit.

Of the \$57bn¹² discretionary funding¹³ 26% is committed to “maintain existing system” (of which some may not be car and light truck mode) and 7% is further split to “boost freeway and transit efficiency”. Restated – while less than 9.6% of commuters use transit, a disproportionately low amount of funding is allocated to users' preferred form of transit – cars and light trucks.

ABAG and MTC appear not to have taken note of the comments made in 2007 by the Federal Highway Administration in response to Portland's Metropolitan Planning Organizations which stated (amongst other critical comments in the same regard):

¹² Draft Plan Bay Area, Page 12 “Transportation Investments”, paragraph 2.

¹³ Draft Plan Bay Area, Page 12, Figure 2 “Plan Bay Area – Discretionary Investment Summary”

"The plan should acknowledge that automobiles are the preferred mode of transport by the citizens of Portland – they vote with their cars everyday".

Questions:

Q21: Why does the plan not acknowledge and use as a basis that only 15.6% of SF Metro Statistical Area commuters use transit?

Q22: Given that cars and light trucks are residents preferred mode of transportation how does the plan arrive at such large discretionary expenditures on transit and land use to encourage transit use?

C214-33

9. Plan Fails to Consider Impact of Concentrating Development in Locations With Disproportionately High Particulate Emissions, Ozone and Noise Levels That Are Near Transit

The plan encourages through expenditure of grants and land use policy, that new housing be located near transit such as train tracks, freeways and highways. Goal #2 –adequate housing encourages such housing to ensure representation of all income levels .

As a consequence the plan causes low income groups, which may be disproportionately made up of ethnic minorities, to be encouraged to live in locations that are less healthy due to particulate emissions, high ozone levels, noise (e.g. railroad crossings and traffic). There are many reports not disclosed or discussed in the plan that identify causal links between proximity to freeways and highways, asthma, autism and cancer.

References:

i) LA County and Southern California Medical Center, University of Southern California Keck School of Medicine: ***"Residential Proximity to Freeways is Associated with Uncontrolled Asthma in Inner-City Hispanic Children and Adolescents"***

iii) Keck School of Medicine, University of Southern California, 2005:

<http://www.usc.edu/uscnews/stories/11614.html>

This represents just a small sample - the number of reports similar to this are too numerous to list but may be easily found using Google.

Residents, press and elected officials who praise and support the plan for providing more low-income housing, if they were properly informed, may instead have objected had disclosure occurred revealing that the plan consigned low income and ethnic minorities to such known, unhealthy locations.

Questions:

C214-34

Q23: Why does the plan not recognize that the compact infill development proposed will adversely impact low income and ethnic minorities by placing them in areas of higher diesel particulate and ozone emissions causing known negative health effects such as asthma, autism and other diseases?

C214-35

Q24: Why does the plan not disclose that many studies exist relating proximity to freeways has adverse health impacts?

C214-36

10. Plan States that “Compact Infill Development Can Reduce Vehicle Use” Without Adequate Substantiation (page 123, Draft_Plan_Bay_Area.pdf)

The plan provides insufficient evidence that encouraging residents to live in compact infill development will *cause* those residents to switch from using vehicles to transit. Published studies exist that dispute such a causal effect, or state that significance is too low to be meaningful. For instance the 2008 study by David Brownstone of the University of California, Irvine on “Driving and the Built Environment”¹⁴.

No sensitivity analysis is included in the plan to provide adequate proof of such a linkage that such development will reduce vehicle use. Figure 2 on page 123 of Draft Plan Bay Area is misleading as it only considers transit use based on where residents currently live. It does not prove that by encouraging through subsidization, land use policy, or otherwise that residents who move to infill development near transit will have *a higher likelihood of switching* to using transit.

Furthermore sufficient evidence exists that proves that there is no such causality. For instance the city of Portland has conducted highly aggressive “compact infill development” policies combined with significant transit investment yet the historic results disprove such causality. In downtown Portland the share of weekday commuting on transit actually fell from 46% of trips to 36% during the past decade (according to annual surveys done by the city auditor), despite substantial expansion of the city’s Max light rail and streetcar system¹⁵.

Questions:

Q25: Where does the plan provide documented evidence of a causal effect that provision of compact infill housing will first cause residents to move to this housing and second cause residents who move to switch from using cars and light trucks to transit (and that they did not already use transit or plan to switch to transit)?

¹⁴ Also reference Randal O’Toole, Smart Growth Plans are a Failure in Portland:

<http://www.cato.org/publications/commentary/smartgrowth-plans-are-failure-portland>

¹⁵ Sustainable Planning is Not So Sustainable: <http://www.cato.org/publications/commentary/sustainable-planning-is-not-so-sustainable>

C214-37

11. Plan Fails to Disclose Subsidization Required to Encourage Residents to Switch to Compact Infill Development Near Transit

The plan fails to identify through historic patterns, known by other regions and cities and a matter of public record, the true amount of subsidization required to encourage builders to develop such housing, and for residents to move to the new housing.

A survey by the National Association of Realtors in 2011¹⁶ backed up by actual experience reveals that the vast majority of Americans prefer to live in single-family homes with privacy and yards. Plan Bay Area is likely to produce a surplus of multi-family housing, which means developers will need large subsidies to persuade them to build such high density projects.

Evidence exists that subsidies are required in order to encourage people to move to high density housing¹⁷. There is no sensitivity analysis published to ascertain and validate the amount of subsidization required to encourage a given number of residents to switch to this type of residence, or to cause developers to initiate and complete such projects.

This lack of specificity means that an unreasonable (in fact undefined) amount of public money – state, county or city - may be spent to achieve the stated goals. Readers are in no way alerted by the plan to rising property taxes, sales taxes or needed to raise revenue to cover these subsidies. Alternatively the plan does not provide sufficient (if any) consideration that existing services such as police, fire and schools will be reduced in quality.

Furthermore there is no evidence that the expenditures covered by the plan will achieve the stated goals. This unsubstantiated logic is used to propose land use policy and allocation of resources in various places throughout the plan. This logic and presumed causality appears to be a fundamental tenet of the plan.

Questions:

Q26: Where does the plan provide documented evidence of the causal effect, such as sensitivity analysis, to identify how much subsidization will be required to cause residents to choose to move to compact infill locations?

¹⁶ National Association of Realtors Community Preference Survey 2011. . Sample size 2,071 American Adults.

See page 17: <http://www.realtor.org/reports/2011-community-preference-survey>

Page 17. Strong preference for single family detached house (80%), single family attached house or townhouse (7%) in response to the question "Right now, if you could choose, which of the following would you prefer to live in?"

Page 19, important community characteristics "Privacy from neighbors: 87% important, 45% very important).

¹⁷ The Folly of "Smart Growth", Randal O'Toole:

<http://www.cato.org/sites/cato.org/files/serials/files/regulation/2001/10/otoole.pdf>

Page 23: "Yet despite the shortage of single-family housing, Portland residents have failed to embrace Metro's high-density developments. In 1999, apartment vacancy rates were at seven percent, the highest in the decade, and reached 11 percent for apartments built in the 1990s. In a market where single-family home prices have nearly doubled, apartment rents have failed to keep up with inflation

C214-38

Q27: Where does the plan identify the impact on taxes or local services (E.g. fire, police, ambulance, schools...) of the increased compact infill development?

C214-39

12. Plan Fails to Consider and Identify Causality, Preventing Effective Feedback & Decision Making

The plan fails to provide effective substantiation of causality, or normally required sensitivity analysis. For instance (and not limited to the items stated below):

a) When residents move to infill locations near transit this causes them to increasingly take transit

b) The amount of subsidies required to encourage a resident to move into an infill location near transit

c) The reduction of CO2 caused by switching passengers from cars and light trucks to transit. E.g. there is strong evidence that trains, ferries and many bus services have higher CO2 emissions per passenger mile than cars and light trucks in the appropriate timeframe (e.g. a train operational from 2015-2045 should be compared to car and light truck CO2 emissions at the midpoint of the train's lifespan - 2030).

The Plan Bay Area documents , and the inaccurately represented causality provides insufficient and/or potentially erroneous information whereby the public, elected representatives, and ABAG and MTC committee members base decisions such as support or opposition to the plan, or selection the alternatives presented.

Restated, decision makers and public have not be provided with reasonable due diligence to prepare the information needed to make far reaching decisions, and may select the wrong alternative, or a valid alternative may not have been identified, considered and presented.

Questions:

C214-40

Q28: How does the plan provide complete and accurate facts, with substantiating logic such as sensitivity analysis that ensures policy makers, elected representatives and ABAG and MTC committee members can make accurate decisions?

C214-41

Q29: How did the plan arrive at the alternatives presented? Why are there no alternatives that seek to reduce congestion and increase commute radius?

C214-42

Q30: Do the alternatives considered and presented account for transit CO2 emissions, lowering car and light truck emissions, residents' transportation mode preference and on many occasions dependence on cars and light trucks as the only practical mode of transit? (E.g. elderly and disabled residents who cannot walk or bike).

C214-43

Q31: Do the alternatives considered and presented take into consideration that CO2 emissions for short car and light truck journeys (e.g. driving to transit) are disproportionately higher than long journeys? (E.g. catalytic convertors take time to become effective)

CONCLUSION

C214-44 | The Draft Plan Bay Area's DEIR is inadequate in numerous instances identified in this Comment Letter. ABAG must prepare an EIR that adequately analyzes the Project's Impact and meets CEQA guidelines.

Sincerely,

Richard Hall
Quiet and Safe San Rafael

Metropolitan Transportation Commissioner

Dear Commissioner,

C215-1 I am writing to urge you to ensure that the final Plan Bay Area incorporates the best elements from the Environment, Equity, and Jobs (EEJ) alternative and includes additional key mitigations to steer our region towards the best possible future for all Bay Area residents.

Compared to all the other alternatives, the EEJ alternative would bring us less traffic, healthier residents, fewer traffic deaths, and more affordable neighborhoods, and it would do a better job of allowing our most vulnerable neighbors to stay in their homes. But the draft of Plan Bay Area currently under consideration lacks some of the best policies from the EEJ alternative and additionally misses opportunities for greater equity and better transportation choices.

C215-2 I am particularly concerned about the proposed Express Lane Network, which fails to harness the potential of high-occupancy toll (HOT) lanes, will cost us more in the long run, and will increase greenhouse gas pollution. As proposed, the Network will continue the cycle of “build more lanes, attract more drivers” by pumping all revenue back into new highway lanes, without adding more transportation choices or addressing the potential impacts to low-income travelers.

In order to address these flaws, MTC should:

- C215-3**
- Implement mitigations to ensure low-income families receive an equitable share of the benefits and do not bear a disproportionate burden of the HOT network;
 - Ensure that with the opening of every new HOT lane, there will be a simultaneous improvement in transportation choices – transit and vanpools – along the same corridor, over and above existing transit service and paid for by a combination of net revenues from the HOT system and new revenues from other sources.
 - Optimize existing lanes instead of just building more highway, and use the savings to pay for more public transportation choices and mitigations for low-income travelers.

In addition, please support changes to the following policy areas in the draft Plan Bay Area:

- C215-4**
- Transit: Substantially increase funding for transit operations and institute a regional youth bus pass.
 - Affordable Housing: Plan for sufficient housing affordable to low-wage workers in all infill locations with access to jobs or transit.
 - Displacement: Strengthen OneBayArea Grant program to better incentivize local anti-displacement and affordable housing policies. Fund mitigations, such as land banking and housing rehab.

Done well, Plan Bay Area will protect our environment, improve our economy, increase social equity, conserve agricultural lands, and make our lives safer and more secure. I urge you to use your role as a regional leader to shape a regional plan that will bring the most benefits to the most people, so that our common future will include greater health, safety, and prosperity for all.

Subject: Make Plan Bay Area work for all Bay Area Residents

Metropolitan Transportation Commissioner

Dear Commissioner,

We need to work together to get people out of private cars and into alternative transportation - transit, bicycles, walking - for the health of all.

I am writing to urge you to ensure that the final Plan Bay Area incorporates the best elements from the Environment, Equity, and Jobs (EEJ) alternative and includes additional key mitigations to steer our region towards the best possible future for all Bay Area residents.

Compared to all the other alternatives, the EEJ alternative would bring us less traffic, healthier residents, fewer traffic deaths, and more affordable neighborhoods, and it would do a better job of allowing our most vulnerable neighbors to stay in their homes. But the draft of Plan Bay Area currently under consideration lacks some of the best policies from the EEJ alternative and additionally misses opportunities for greater equity and better transportation choices.

I am particularly concerned about the proposed Express Lane Network, which fails to harness the potential of high-occupancy toll (HOT) lanes, will cost us more in the long run, and will increase greenhouse gas pollution. As proposed, the Network will continue the cycle of “build more lanes, attract more drivers” by pumping all revenue back into new highway lanes, without adding more transportation choices or addressing the potential impacts to low-income travelers.

In order to address these flaws, MTC should:

- Implement mitigations to ensure low-income families receive an equitable share of the benefits and do not bear a disproportionate burden of the HOT network;
- Ensure that with the opening of every new HOT lane, there will be a simultaneous improvement in transportation choices – transit and vanpools – along the same corridor, over and above existing transit service and paid for by a combination of net revenues from the HOT system and new revenues from other sources.
- Optimize existing lanes instead of just building more highway, and use the savings to pay for more public transportation choices and mitigations for low-income travelers.

In addition, please support changes to the following policy areas in the draft Plan Bay Area:

- Transit: Substantially increase funding for transit operations and institute a regional youth bus pass.

- Affordable Housing: Plan for sufficient housing affordable to low-wage workers in all infill locations with access to jobs or transit.
- Displacement: Strengthen OneBayArea Grant program to better incentivize local anti-displacement and affordable housing policies. Fund mitigations, such as land banking and housing rehab.

Done well, Plan Bay Area will protect our environment, improve our economy, increase social equity, conserve agricultural lands, and make our lives safer and more secure. I urge you to use your role as a regional leader to shape a regional plan that will bring the most benefits to the most people, so that our common future will include greater health, safety, and prosperity for all.

Sincerely,

Subject: My Opposition to Plan Bay Area and the EIR for Plan Bay Area

MTC and ABAG
May 15, 2013
101 8th Street
Oakland, CA

C217-1 I strongly oppose Plan Bay Area, including, but not limited to, any and all low income and very low income, high density, stack and pack housing projects. Organizations such as Democrats
C217-2 against Agenda 21, OrindaWatch.org, and Pleasant Hill Citizens for Responsible Growth, have identified a plethora of community, population growth, overcrowding, crime, police, educational, land use, vehicle use, tax, funding, and environmental issues which are not adequately addressed by Plan Bay Area.

C217-3 I strongly oppose Plan Bay Area because local control of planning decisions is taken away and given to unaccountable regional government bureaucrats at ABAG and MTC who have an agenda to urbanize and destroy as many Bay Area suburbs as possible.

C217-4 I strongly oppose the EIR for Plan Bay Area because citizens were not given enough time by MTC/ABAG to read 1300 or more pages.

C217-5 I strongly oppose the EIR for Plan Bay Area because it may supercede or be in conflict with local and other government environmental laws, codes, and restrictions protecting the environment and Bay Area citizens.

C217-6 I strongly oppose Plan Bay Area and the EIR for Plan Bay Area because it is not being presented to registered voters in the Bay Area for their vote.

I strongly oppose Plan Bay Area and the EIR because strong opposition by citizens and taxpayers to Plan Bay Area at local city councils and at regional MTC/ABAG meetings and have been either ignored or rejected by city councils and MTC/ABAG representatives.

C217-7 During the April ABAG/MTC meeting on Plan Bay Area at the Walnut Creek Marriott the following 9 questions were submitted in writing to ABAG/MTC representatives. I oppose Plan Bay Area and the EIR for Plan Bay Area because I have not received any answers to the following questions, even though an Email address was provided and an ABAG/MTC representative told the group gathered at the Marriott that all questions submitted in writing would be answered:

C217-8 1. Why is Plan Bay Area, a plan of such great magnitude, not being presented to the citizens of the Bay Area, including Contra Costa County, for their vote?

- C217-9 | 2. Plan Bay Area requires 80% of all new houses to be stack and pack. Where is the empirical, peer-reviewed evidence that 80% of Bay Area citizens want to live in high density, stack and pack housing?
- C217-10 | 3. Plan Bay Area includes a massive series of unfunded mandates. SB 375 requires unfunded mandates on counties and cities to be identified. Where is the analysis in the Plan and the draft EIR of the cost to counties and cities of these unfunded mandates, and the impact of this cost on the likelihood of Plan Bay Area being effective?
- C217-11 | 4. Why doesn't the Plan Bay Area ratification process include a process whereby all cities submit their own economic and environmental impact analysis?
- C217-12 | 5. Why isn't there a third party official audit process of the assumptions of Plan Bay Area impacts and of the economic and environmental analysis used in Plan Bay Area to make sure that all data and procedures are fair and unbiased?
- C217-13 | 6. Why is there zero funding in Plan Bay Area for more schools, police and fire protection needed for the population growth identified in the plan?
- C217-14 | 7. Where in Plan Bay Area is the analysis of the impact of low income, high density, stack and pack housing on the property values of surrounding properties and the crime rates of applicable Bay Area communities?
- C217-15 | 8. Since the Plan impacts all 9 Bay Area Counties and all 101 cities of the Bay Area, why doesn't Plan Bay Area include city by city as well as county by county economic and environmental impact analysis?
- C217-16 | 9. Many of the PDAs targeted for new housing and commercial development are in low lying areas and or are on landfill. Given the dependence of the Plan on these sites, why hasn't there been any assessment of the additional risks this Plan creates in the event of sea level rise or a major earthquake?
- C217-17 | My perception was that most public speakers at the MTC/ABAG Walnut Creek Marriott meeting expressed their strong opposition to Plan Bay Area. I oppose Plan Bay Area and the EIR because MTC/ABAG representatives at the Walnut Creek Marriott meeting did not answer most questions presented by public speakers, who were limited by MTC/ABAG to only 2 minutes each.

A concerned citizen and Contra Costa Taxpayer

Subject: One Bay Area

Hello,

I recently attended the One Bay Area “discussion” at Dominican College. Clearly your minds are made up. From Sacramento down to the Marin County Board of Supervisors and a myriad of public servants think you all know better than the people. You say, “You elected us to take care of you and that’s exactly what we’re doing.” On the surface, who wouldn’t agree with you? Who doesn’t want clean air, clean water, a non-rising sea, and close ties to neighbors? We all do, but we want to bring it about on our agendas, not the government’s. This is America made up of strong, individualists, and doers! If want to make something happen, we will make it happen. We don’t need a government centrally planning our lives. We don’t want to be stuffed into “corridors” of people, living so close to where we work cars won’t be needed. That’s totally unrealistic. We don’t want “smart” trains ferrying us around. If we do, we will build them. If we’re old, we don’t need to be relieved of the burden of our big homes. If we do, we’ll make that decision. You’re right on one point. Marin is one of the most beautiful areas in the United States. Do you think bringing in hundreds of low income units will make this county more beautiful? And of course the elephant in the room: who is going to pay for all of this? I know, grants, transportation funds, etc. Well that money comes from the people in this county who PAY TAXES. Many of the people you’re lobbying to bring in don’t!

Some of the weaknesses in your projections:

- C218-1** | Unrealistic job and housing numbers
Inadequate evidence that high density housing near transit reduces green house gases (GHG)
Inadequate evidence that the transportation plan reduces GHG
- C218-2** | Evidence that this plan increases costs for housing and transportation among low-income households
- C218-3** | Inadequate information re: water supply, sea level rise, and support for infrastructure
- C218-4** | Significant, irreversible environmental changes and 39 significant unavoidable impacts of the plan, identified in the EIR, should not be dismissed with findings of “overriding consideration.”
- C218-5** | I’m sure you’re well intended, but your reasoning is flawed. I suggest you put off any decisions regarding One Bay Area until the present financial ills of the State of California have been cured. Then let’s examine the future.

Regards,
Elizabeth Appell

Dear Sirs:

I appreciate the conscientious effort that the Metropolitan Transportation Commission and the Association of Bay Area Governments have invested in Plan Bay Area, the Bay Area's regional sustainable communities strategies plan. The Plan could reduce the Bay Area's contribution to climate change by siting new developments near transit, and investing in public transportation to allow all of us to drive less. However, that important goal is more likely to be achieved if the final Plan includes two important measures that from the Environment, Equity and Jobs Alternative, which your analysts found to be the environmentally superior alternative.

I urge you to:

C219-1 Increase funding for transit operations by at least the same amount incorporated into Alternative 5 (The Environment, Equity & Jobs Alternative) to restore transit service and improve transit riders' experience at least to levels commonly experienced before drastic cuts began in 2006. This increased funding is needed to avoid continued overcrowding at peak hours, and ensure that reliable transit is available to all bay area residents.

C219-2 Plan for, and fund, affordable housing in all transit rich and job rich communities throughout the Bay Area, at least at the levels incorporated into the Environment, Equity and Jobs Alternative, and encourage jurisdictions to adopt anti-displacement strategies to allow low-income residents to stay in their homes and neighborhoods.

Thank you for your attention.

Sincerely,

Ashley Eagle-Gibbs

(510) 464-79267

Dear Sirs:

As a former Bay area resident, career regional transportation planner, and current grants administrator working in the Puget Sound Region, I appreciate the efforts that the Metropolitan Transportation Commission and the Association of Bay Area Governments have invested in Plan Bay Area. The Plan could reduce the Bay Area's contribution to climate change by siting new developments near transit, and investing in public transportation to reduce vehicle miles travelled. As on the ground developments within the Bay area and other major US city demonstrate, progress is more likely to be achieved if the final Plan includes two important measures that from the Environment, Equity and Jobs Alternative, which our analysts have found to be the environmentally superior alternative.

So I urge you to support:

Increased funding for transit operations by at least the same amount incorporated into Alternative 5 (The Environment, Equity & Jobs Alternative) to restore transit service and improve transit riders' experience at least to levels commonly experienced before drastic cuts began in 2006. This increased funding is needed to avoid continued overcrowding at peak hours, and ensure that reliable transit is available to all bay area residents; and

Plan for, and fund, affordable housing in all transit rich and job rich communities throughout the Bay Area, at least at the levels incorporated into the Environment, Equity and Jobs Alternative, and encourage jurisdictions to adopt anti-displacement strategies to allow low-income residents to stay in their homes and neighborhoods.

Thank you for your leadership,

Sincerely,
Eric Irelan

Subject: comment on plan Marin resident

In order to receive the most recent information upon which to comment, I found pages at your site which appear inconsistent with respect to the alternatives. In any event, since CEQA requires a "No Project" alternative, I must assume that anything inconsistent with this, must be incorrect.

C226-1 I do support No Project, based upon the fact that Marin county, where I live, is not metropolitan, has rudimentary transportation, and at a population of about 250,000, fewer than 100,000 of whom are taxpayers, will most likely never have the transportation system to support the housing envisioned by this plan. Moreover, since the plan essentially views from behind, rather than forward, it will be obsolete by the time it could ever be implemented.

For our world, changing because of many things, including the technological revolution, we need the flexibility that local control affords us. It goes without saying that this is also the democratic way. Top-down government manifestos seldom work.

Subject: alternative #1

C227-1 I wanted to take a moment to urge you to please consider voting for Alternative #1, No Project in regards to Plan Bay Area.

Me and my family recently moved to Marinwood to get away from the hustle & bustle of SF. I never imagined I would live in the 2nd densest city in the country (SF) and it was simply too much for me. Moving our Asian/Caucasian family to Marinwood was the best decision we ever made. Living a quieter simpler life where our kids can safely play in the street without the density of urban life.

I hear often advocates of Plan Bay Area speak about racial/socio-economic nimbyism, but that's not the issue, simply put it's human density. People that have invested in these communities do not want to live with density, period. The goal of Plan Bay Area is to promote the thing that people that already live here do not want.

Thank you for reading

Jon Campo

Dear Marin County Supervisors,

C228-1 | We urge the Marin County Board of Supervisors to work with ABAG & MTC to remove Tam Valley and Almonte from the Hwy 101 Corridor Priority Development Area of Plan Bay Area.

C228-2 | We also urge Marin County's Representatives to demand a minimum of six more months before making a decision regarding the Draft Plan Bay Area in order to educate Marin residents about the plan and in order to thoroughly evaluate the plan.

C228-3 | ABAG and MTC and Marin County's Representatives should recognize that there is an ultimate limit to growth and reduce the total projected build-out of any Bay Area Sustainable Communities Strategy to a level that is sustainable. ABAG and MTC and Marin County's Representatives should also preserve the environment and protect public health and safety and prevent any Bay Area Sustainable Communities Strategy from mandating development in hazardous areas.

C228-4 | Please vote for the "NO PROJECT" Alternative.

Concerned Tam Valley Residents,

April 8, 2013

Dear ABAG Representatives,

I am a long time resident, voter and property owner in the Bay Area. I have recently become aware of the One Bay Area Plan and the sweeping changes proposed for the Bay Area by ABAG and MTC to implement California State Senate Bill 375 and the State's housing element laws.

I am outraged that the locally elected officials we have sent to represent us in this process have selected for adoption, an ABAG plan alternative (Option 2) that threatens our way of life, our property, our sacred values and our right to self-determination. I support the no plan alternative (Option 1) which leaves planning to the local city and county authorities where it legally belongs.

This One Bay Area Plan sacrifices our future transportation and housing needs in favor of reducing carbon emissions and addressing climate change. Truthfully, it achieves neither, while locking the 7 million people in the Bay Area into an expensive and ineffective one-size fits all "Solution" for the next 25 years, not taking into account the dynamic nature of technology and societal changes that make this type of planning obsolete before the ink is dry.

This One Bay Area Plan is not our choice. It is a mandate to ruin our cities so they can be densified and then rebuilt as "livable". My city is very livable right now and we don't want this draconian regional approach to planning foisted upon us.

The Association of Bay Area Governments is a joint powers authority, created as a vehicle for regional coordination of inter-county issues. County and City membership in ABAG is voluntary. If you adopt this One Bay Area Plan you are voluntarily giving up your county's and city's rights to determine how best to address the future needs of your unique community. Please provide your community with the necessary leadership to stand up for your residents and say 'No!' to the One Bay Area Plan in its current form.

ABAG and MTC have received repeated, strong objections to the forecasts underlying its planning process from numerous stakeholders over the past several years. The counties and cities in the Bay Area need to determine their own independent sustainable communities strategies with ABAG and MTC acting solely in a coordination role.

I am looking forward to your response on how you will represent your constituents on this issue and on regional issues in the future.

Sincerely,

Sebastian Ziegler

Subject: Draft Environmental Impact Report (EIR) Released

Hello,

I am writing you regarding On Bay Area. You people need to reconsider your process and timing for making decisions on this misguided idea. Here are some ideas to start with...

- C231-1 1. More time is needs to be allowed from release of EIR documents to hearing...I recommend a minimum of 6 to 8 weeks for review.
- C231-2 2. Meeting must be held in the evening to allow the working taxpaying public to attend. WE fund this city and demand you hear our voice.
3. At a minimum there must be multiple meetings in each county so ALL citizen can have a thorough voice in this highly controversial activity.

You people have done enough damage to our economy.

Thanks,
Victor

CC 4-22-13

I have many concerns about Plan Bay Area and below are just a few of many of them.

- C232-1** 1. The plan is 160 pages, the draft EIR is 1300 pages and there are thousands of pages of additional documents to accompany it. I would ask that you extend the deadline for the Public to submit comments well beyond the May 16, 2013 4PM deadline. I would suggest 6 to 12 months extension.
- C232-2** 2. Since past and current preference surveys indicate 60-80% of residents prefer single family homes, why is the plan requiring that 80% of all new homes be stack and pack ? Who wants to live over a restaurant or Bart tracks if you can have a single family home with the privacy of a yard?
- C232-3** 3. Why has there been little analysis of the impact high density housing will have on property values of existing properties in a community?
- C232-4** 4. There is no funding for more schools, police or fire protection in the plan. Why? Who will pay for these additional needs?
- C232-5** 5. Plan Bay Area will adversely affect our way of life. With such a wide-reaching and dramatic change to life as we now know it, I believe this plan should be presented to the citizens of the Bay Area for a vote.

Barbara Hagen

Orinda, CA

- C233-1** 1. The "Plan" and the draft "EIR" assume there is going to be Bay Area population expansion. There is nothing to substantiate that. We have a replication ratio of less than 2.0 and we have a net migration exodus. There is no need for housing expansion in the foreseeable future. There is no need for your housing proposals.
- C233-2** 2. It appears that this plan is being executed by non elected public agencies. If you're going to dictate what a county and a city can do you must be elected to do so. An "elected ABAG" would have control over the bay area counties, and the cities within each county. This "Sub State" would be subservient to the State of California. You cannot create a "substate" as you seem to have done. You can't do this by appointing voting members. You can't quaisi elect people to serve in something this important.
- C233-3** 3. The 160 page "Plan" and the 1336 page draft EIR is too long to understand. There's no way we can adequately understand what's in the Plan in the time we've been given to evaluate it. We must have more time.
4. As a member of the group Save Orinda, I have discussed this with many. A very strong majority of Orindans I have discussed this with are opposed to it.

I've been an Orinda resident since 1977

Date: 5/16/2013 3:41 PM
Subject: Please vote "Alternative 1: No Project" for Plan Bay Area

C235-1 Please opt-out of Plan Bay Area and go with the "Alternative 1: No Project". Plan Bay Area pursues laudable goals, but the implementation is sorely lacking. Please do not urbanize our suburbs under the false hope that it will decrease auto pollution. You have used incorrect growth assumptions to justify this plan. There are many inadequacies that have not been addressed by MTC or ABAG.

C235-2 1. This T.O.D. housing is going to cause an asthma epidemic & a we need a plan to mitigate the long-term health consequences of this Plan.

C235-3 2. We have neither the water nor the sewage capacity to handle this growth. This development would necessitate the need for a desalination plant, which has been a very unpopular issue.

C235-4 3. Sea-level rise is going to be occurring in many of these planned PDA's in this century.

C235-5 4. It will destroy the beauty of Marin. We do not need big apartment buildings up & down 101 in the hopes that more people will take public transit.

C235-6 5. Your proposed Vehicle Miles Travelled Tax with a GPS in every car is downright creepy & a bit too Big Brother. Other states have vehicle inspections at the DMV, where they check the license & insurance of the owner, as well as operability of the vehicle. I know that around here, that would be considered intrusive, but the GPS is worse. It also isn't replacing our DMV fees or fuel taxes, but is just another tax. I know that your \$200 million Taj Mahal is going over-budget, but our tolls should be enough.

C235-7 6. You are unelected regional agencies, and should not have the authority to dictate this policy upon us. Unless your boards are modified to become directly-electable by the people, then you should not be allowed to force this down everybody's throats.

I wish that all of Marin would follow Corte Madera's lead, and get out of ABAG until the board is made directly-electable.

Subject: To whom it may concern,

C236-1 I would like to register my disagreement with the 'plan bay area' both the PDAs & the PCAs. Most of Marin county's PDA are located along the Bay where threaten species and wetlands are. Since we are in the time of rising ocean levels, why would this even have been considered as a way to move forward in the future. There seems to be no addressing of the profound negative impact on our native and endangered species, the ecosystems, our beautiful vistas. Why would you think of increasing buildings on the Bay is a positive move forward for our community.

C236-2 You must go back to the drawing board, be more inventive and creative. Your solution will only bring more blight and destruction to our beloved Marin. WERE THINK THIS PLAN IT IS WRONG! You need to talk to more of the residents and not to people who will profit from this plan.

Mr. Mark Luce, President
Association of Bay Area Governments
P.O. Box 2050
Oakland, CA 94607-4756

Subject: Plan Bay Area Public Review Period

Dear Chair Worth and President Luce:

C237-1 I respectfully request the public review process of the Plan Bay Area Plan be extended by ninety (90) days beyond the May 16, 2013 deadline. If you refuse to do so it will only increase the public mistrust in your respective Commissions.

The plan as now presented is full of assumptions on almost every topic so far divorced from reality. Your commissions have immersed yourselves out of the public view over a long period of time unconnected to reality of the diverse communities you purport to represent.

C237-2 The Bay Area is composed of five (5) mini climates, each with their own topographical features, unstable soils conditions and seismic fault lines, creeks and streams above and underground. It is absolutely necessary planning continue to be done on a local level, by local planners and residents aware of these constraints.

In the case of Lafayette our neighborhoods outside of the downtown were designed and developed in the valleys to the north and south of the downtown. We have narrow winding roads many with only one way in and out.

Your Plan envisions the housing of the future to be compact apartments instead of single family homes with a yard for children to play. Whatever makes you think this is the environment families wish to raise their children. My husband and I met, courted and married in New York City. We both enjoyed living there before we started a family, however it is not where we chose to live once we had children. How fortunate we were to have the where with all to start a successful business in the Bay Area and chose Lafayette as our ideal family friendly community.

Attached comments from April 22, 2013

Thank you for your consideration.

April 22, 2013 comments ABAG/MTC meeting Walnut Creek Marriot

Byrne Mathisen, Lafayette resident 34 yrs. Currently VP Happy Valley Improvement Association and the HVIA rep. to the Lafayette Homeowners Council. The HVIA has been in existence for over 65 years representing the 1100 households north of the Lafayette BART Station.

We meet 9 times during a calendar year with an additional Annual Meeting to discuss issues of the day we send out Newsletter in advance of the Annual meeting.

One year we had the fire chief come and go over what we could do to make our area in the city of Lafayette safer. We are a neighborhood of older, narrow, winding roads in a hilly environment with few Ingress and egress points. What you could call a fire trap.

Actually all of Lafayette neighborhoods are within valleys; Acalanes Valley, Burton Valley, Reliez Valley and Happy Valley. All of which have the same constraints.

C237-3 | Plan Bay Area will change our way of life, irreversibly. We vote for relatively minor changes to our life like a ¼ percent sales tax. Whether or not a vote is statutorily mandated, why on earth is this Plan of such magnitude not being presented to the citizens of the Bay Area for a vote?

The city of Lafayette has a General Plan (I served on the citizens advisory Committee) We also have a Downtown Specific Plan more than 5 years in the making I attended 80 % of the meeting. We have a second unit ordinance which I covered for our association and presented our Associations recommendations.

The city has a newsletter Vistas published four times a year. VISTAS are what we have all over our city. The residents put a very High value on these and wish to keep them.

C237-4 | Given that the plan is so heavily dependent on housing units being built near BART why hasn't there been more analysis of the impact on the physical and emotional health of residents living so close to such high noise sources?

C237-5 | Why has there been little analysis on the impact of high density will have on property values of surrounding properties?

C237-6 | Why is there zero funding for more schools, police, and fire protection? How are these going to be paid for and why was funding for these critical elements of land-use and transportation planning not included in the plan?

C237-7 | Plan Bay Area's premise suggests CEQA waivers for eligible projects, with reduced parking spot requirements for such projects. At a minimum, the automobile is a necessity of life for long trips outside the region and to enjoy the beauty of the Bay Area, and for transporting oversized and heavier items. How will this plan prevent or limit people from using their automobiles at all?

C237-8 | Innumerable examples of vacant retail locations below residential facilities dot the map of the Bay Area and other locations. Why are there few studies of the performance of mixed-use residential/retail buildings?

C237-9 | Since this plan impacts all 9 Bay Area Counties and all 101 cities of the Bay Area, why doesn't this plan include individual city-by-city and county-by-county economic and environmental impact analysis? Why doesn't the Plan Bay Area ratification process include a process whereby all cities submit their own economic and environmental impact analysis?

C237-10 | Why isn't there a 3rd-party official audit process of the assumptions of Plan Bay Area's? Impacts and of the economic & environmental analysis used in Plan Bay Area to ensure that all data & procedures were fair and unbiased?

C237-11 | The Energy Information Agency's data shows that the United States energy-related impact on CO2 inventories is approaching 1990 levels already without the implementation of Plan Bay Area and shows that CO2 has been declining every year since AB32 passed except for 2010. Reasons cited include lower economic activity, the shift from coal to natural gas, and the adoption of improved efficiencies in automobile emissions standards.

The Plan does not include the expected impact of CAFE-2050 automobile standards on Greenhouse Gases. Why are these key data and premises not included in the analysis on whether or not Plan Bay Area is even required at this point?

C237-12

I request that the Plan Bay Area be suspended until these key data be reviewed and included in the analysis.

C237-13

Subject: Plan Bay Area - Vote "No Plan"

Dear Honorable Officials,

Vote No Plan or Six Month Extension

C238-1 I urge all to vote "No Plan" or a six month extension to further review the long EIR documentation. I will briefly explain my reasoning below.

Build Now, Worry Later

We just came through a "housing boom" that nearly bankrupted the nation. Homes were built without regard for having jobs to support the mortgages. The "Plan Bay Area" included projections of job growth to cover this obvious flaw in unplanned the "build out" of the nation.

C238-2 However, there is nothing in the "Plan Bay Area" to request a review of the local infrastructure when "Priority Development Areas" are submitted or housing quotas are agreed upon.

We all know if the area is overbuilt for the local infrastructure, it will be the tax payers who are on the hook for the infrastructure build out. In areas where adding infrastructure is inexpensive and resources are plentiful, there is little problem. In areas where resources are scarce housing booms can turn into "ghost towns". Areas with abundant natural resources endure economic downturns. Areas with low resources or high costs turn into ghost towns during economic downturns.

Virginia City was once one of the largest cities in the west, but when the jobs went away, it never recovered. San Francisco has endured losing most of the shipping business to Oakland, however, San Francisco has endured due to the resources in place and the ability to take on new businesses.

If all you have is a Hammer, everything looks like a Nail. Plan Bay Area is authored by a transportation group, an air quality group, and a water quality group. There is no group looking

C238-3 into the infrastructure requirements for each city or county. Why are the "County Planners" not involved as a top level group? It takes more than housing and transportation to create a city or village. When submissions are made for "Priority Development Areas", there should be an

C238-4 assessment of resources, the current excess capacity, how much will be used creating housing according to the "housing build out", and high level estimations of the cost to build out the infrastructure. We all know adding to the local infrastructure can vary greatly location to location. Take schools for example. If an area closed down schools, adding classrooms is easy. However, if an area has no additional classrooms and no land to build new classrooms, adding classrooms is extremely expensive.

C238-5 The following should be addressed in every submitted PDA. Assessments of capacity, needed capacity due to additional building, cost to expand for: Water, sewer treatment, sewer lines, solid waste, electric grid, gas pipes, schools, parks, police, fire and first aid.

It is important to know the capacity and the cost. Dubai has shown you can build a city in the desert if you have enough money. This country is currently borrowing trillions of dollars. We can't spend money like we have an oil well in the backyard.

C238-6 Water - "Historically, land use planning has been undertaken with little regard for the availability of water supplies" This is a quote out of the Marin 2007 County Plan. The need for water is not in "Plan Bay Area". The need for water is not evaluated in the PDA's. This is a huge lack of planning. We know if Marin over commits to building, the result will be having to add Desalination Plants, which are huge consumers of electricity. How is this a GHG friendly plan?

"You can have any color you want, as long as it is black" - Henry Ford

C238-7 Numerous time I have been told, "Don't worry we still have local control". If the "Plan Bay Area" has no impact, then why bother passing it? We will have local control; however, it will be after we make the required zoning changes and other changes. This reminds me of that famous Henry Ford quote. Sure will have local control, but first we need to diminish our local control.

Sea Level Rise

C238-8 If you believe in Global Warming and Green House Gas issues, how can this plan not address sea level rise? The plan lists over 100 acres in Marin that are subject to "Liquification" and "Flooding". Add in Sea Level rise and I worry about the plan.

Green House Gas and Driving

C238-9 On average in Marin, accounting for round trips:114, 000 vehicles cross the Golden Gate Bridge.72,000 vehicles cross the Richmond San Rafael Bridge.38,000 vehicles cross into or out of Marin from Vallejo.83,000 vehicles cross into or out of Marin from Sonoma.192,000 vehicles pass the Civic Center in a day.
More vehicles pass into and out of Marin than the entire population. Assuming 1.5 people per vehicle, that is a huge number of people. Plan Bay Area's solution is to add the SMART train, with 156 seat trains leaving twice an hour. This truly is a "1% solution". Then add more people around the SMART stations, assuming they will only use the train. I feel this solution is much like the "Paperless Office" concept that used more paper than it saved.

Population and Job Projections

C238-10 I find the population and job projections far to the high side. Marin has been growing at the rate of 2-3% over the last 10 years. Most of the areas are built out. Many people are assuming "clean tech jobs" will add to the Marin economy. Having been laid off from a major tech firm in Marin twice, I can state, "If the same job can be done somewhere for cheaper labor, the job will go there." If the job is not tied to a local resource, it can vanish at the whim of accounting.

Additional Housing

C238-11 There is a need to add more housing. However, I don't want to do a reply of the Housing Boom where an area is "over built" without looking at the full picture and impact.

Summation

C238-12 Please vote "No Plan" until the plan requires adequate planning of proposed build out sites.

Thank you,
Kevin Moore

MTC

SUBJECT: Comments on Plan Bay Area EIR and merits

Dear Mr. Heminger and MTC Planning Staff:

Please consider the following points regarding the proposed "Plan Bay Area" (Plan) and its EIR. As disclosure, I serve on two "Citizens' Advisory Committees" regarding the City of Larkspur's General Plan update and its Station Area Plan, but these comments are solely my own, and not are not presented on behalf of either CAC, or in any other official Larkspur capacity. Additionally, while the focus of these comments is unavoidably on concerns with the Plan, I acknowledge and appreciate the hard work and good intentions of MTC, ABAG and other regional agencies involved in developing the Plan, especially given arguably-unrealistic state legislative goals.

Many of these points are primarily directed to the project-merits, but I would ask that they inform the planners' thoughts on the scope and content of the EIR as well, to the extent possible. The points also focus mainly on the reasons that the Plan's proposed "densification" (to use a term which MTC staff used, when meeting with the Larkspur General Plan CAC) would appear to be especially unfair and unreasonable to Larkspur, where I live.

A. General

By now agency staff developing the Plan are very familiar with the general concerns often expressed regarding the Plan. Just three that seem especially pertinent are highlighted here before turning to the impact on Larkspur.

1. Much of the basis for the Plan's densification initiative as respects Marin appears to be the mistaken classification of Larkspur and other similar small Marin cities as urban rather than suburban. Clearly, a classification that fails to distinguish between Larkspur and Oakland or San Francisco is unreasonably overbroad, and fundamentally flawed. Please reconsider the classifications on which the Plan is premised, at least as regards suburban areas of Marin such as Larkspur.

C239-1

2. A significant portion of the proposed densification would appear to be in low-lying areas susceptible to rising water-levels, and thus potentially requiring levees in the foreseeable future. (In fact the Marin Independent Journal quoted you as saying to someone at a public meeting who questioned putting projects in harm's way: "I think we'll protect them.") The potential need for levees to protect projects from rising

C239-2

waters should raise a red flag. From New Orleans to Novato, levees have proved to be unreliable 'money pits,' liability tangles, and potential safety-hazards. I'd be pleased to share resource-materials on this issue. This aspect has tremendous environmental and fiscal implications. The EIR should specifically identify and discuss the extent and cost of levees to protect Plan-proposed development from rising waters.

3. Public policy should not disregard considerations of ethics and morality. The Plan, arguably, would rely on means of implementation which many might consider, candidly, to be somewhat morally-suspect -- money for cities that densify; none for those that don't. The carrot and the stick. Or, some might say, bribery and blackmail. Besides smacking of bullying, this "money talks" mode of implementation, especially coming at a time of great fiscal constraint for local communities, would effectively negate the requirement in the Plan's enabling legislation that the Plan not over-ride local land-use prerogatives.

C239-3

Larkspur's experience regarding the Station Area Plan could be a case in point. Larkspur's Council and planners conscientiously sought a small grant of several thousand dollars for circulation planning in advance of the SMART station. However, regional agencies rejected that modest effort, requiring instead that Larkspur apply for and accept *several hundred thousand dollars* of agency funding for a *land-use* study (thus making 'the tail wag the dog'), which was guided by a consultant who was paid largely by regional-agency dollars and who produced a plan for up to 940 units in an already-congested area. The result of this process was thus something completely different than originally envisioned, but one which Larkspur officials, I surmise, believe they must accept if they ever want any more grant dollars for needed infrastructure improvements, in areas heavily affected by traffic from elsewhere in Marin.

C239-4

B. Effect on Larkspur

C239-5

The Plan is widely viewed as flawed because it neither considers the individual circumstances of cities nor provide a procedure to do so during implementation. Thus, its impact would be unfairly uneven and disproportionate. But its densification demands would appear to be especially unfair to Larkspur, for at least nine reasons, summarized below. Some may be familiar to you already; some are not unique to Larkspur; but taken together, they would make the Plan especially problematic for Larkspur.

1. No avoidable 'sprawl.' A key Plan purpose is to encourage compact development instead of suburban sprawl over farmland. Larkspur doesn't face that choice.

a. We are built-out. Thus, the Plan would force radical change to *existing* developed areas, rather than offer a reasonable alternative for *newly*-developed areas.

b. We are wedged between undevelopable marshes, and public open-space hills. This would make the squeeze especially tight.

2. Traffic-choked now. Larkspur's circulation is tightly and permanently constricted by the "iron triangle" of Highway 101, Sir Francis Drake Blvd., and Magnolia Ave. All are already traffic-choked. A Larkspur Landing PDA, which some predict that regional agencies desire, would be at *Marin's most-congested crossroads* -- and would likely make it worse.

3. Traffic "mitigations" inadequate. Densification advocates exhibit great optimism that increased traffic can be "mitigated," but the "mitigations" typically have serious flaws.

- a. They are unrealistic, in their reliance on alternative modes of transportation -- "let them ride bikes" (shades of "let them eat cake"?).
- b. They are autocratic -- coerced 'behavior modification,' essentially. The Larkspur Station Area Plan consultants' own oft-used term, "mode-shift strategy," betrays what it entails -- forcing people to act differently, whether they like it or not, and whether it is practical for them or not.
- c. They are unfair -- 'pain compliance,' in effect; to make driving and parking even more expensive and unpleasant than it already is.

The EIR should realistically evaluate the efficacy and reasonableness of the proposed traffic mitigations, especially for situations where traffic is already often at or near capacity and added density would make a bad situation worse.

C239-6

4. Land-use not in sync with transit. Different agencies and revenue-sources control them, at least in Marin. Marin's bus transit has withered -- especially for Larkspur -- despite continued development. Moreover, historically in urban development, housing followed transit (trolleys or roads). The Plan reverses that pattern, in Larkspur at least. It would densify first, then hope transit followed -- a huge gamble. A more likely result would be *both* more urbanization *and* more cars -- and lesser quality of life. (Sadly, some partisans debating the Plan trade claims of "crime" and "racism." But the real quality-of-life concerns are simply *congestion* and *urbanization* -- more buildings and people and vehicles, squeezed together, in stressful, un-suburban fashion, in spaces never intended to hold so many.)

C239-7

I'd also add that the "support transit" policy which underlies densification is debateable, especially in Marin. First, this policy seems to reflect reversed priorities: Transit should serve the public, not vice versa. Second, of specific concern in Marin, we *already* support transit, with hefty taxes for SMART and local transit. Voters were never told that in addition to the tax, SMART would require extensive high-density development. The after-the-fact revelation of this additional requirement raises questions of fairness and procedural transparency.

5. SMART's timing not in sync with Plan. Densification now at Larkspur Landing is urged, but SMART will not come to Larkspur for years, if ever. And if it ever came, many CAC members and others predict that the gap between station and ferry terminal will greatly reduce its use. Thus, the Landing's purported status as a "transit corridor" and its suitability for dense "transit-centered development" could be speculative, if not chimerical.

6. Key objective unrealistic. The Plan also aims to reduce commuting, especially by service-workers. (The "Downton Abbey" approach -- have them live on the premises.) While this concept seems appealing, especially regarding an affluent area, reality raises obstacles.

- a. Larkspur's high real-estate prices make substantial amounts of truly "affordable" housing mostly infeasible, unfortunately. Even-higher "bonus" densities, which developers want as "incentives," would be needed in order to make cheaper units profitable. And nonprofit-built housing contributes less to the tax base.

- b. Service workers will continue to commute from elsewhere as long as they can get better housing deals elsewhere.

c. To work on a large scale, the Downton Abbey approach to reduced driving requires SF or East Bay-style density, where people can get to almost everything by walking or transit.

7. Infrastructure inadequate, costly. Larkspur's infrastructure and layout date mostly from the 1890s to mid-20th Century. New infrastructure for high-density development is unaffordable -- especially when combined with the cost of other needed repairs. Just fixing our roads -- Marin's worst -- will cost \$20M, a consultant reports. Our century-old City Hall needs retrofitting, to stave off collapse in an earthquake. High density at Larkspur Landing would cost another \$20M in infrastructure, a Station Area Plan consultant reports. We can't afford it all. Moreover, the school districts also repeatedly seek revenue to expand outgrown space, because our schools are already as jammed as our roads.

8. Larkspur didn't cause the problem. To Larkspur's credit, it never pursued "revenue planning" -- policies that caused jobs-housing imbalance, by favoring commercial development to boost revenues, while discouraging housing.

9. Larkspur "already gave." It authorized suburban high-density housing long before doing so became 'fashionable': high-density apartments (Greenbrae, 1950-60s; Skylark, 1960s, Tamalpais, 1960s); high-density mixed-use master plan (Larkspur Landing, 1970s-80s). Some might say we should get a 'break.'

The Plan's apparant densification designs on Larkspur Landing seem especially ironic, because they effectively penalize Larkspur for having already done what densifiers desire. When Larkspur Landing was laid out as an entirely-new neighborhood, in the 1970s, on largely-vacant land (previously noted primarily as the site of the last scene in *Dirty Harry*), it was a rare, almost visionary master plan with an integrated balance of office, retail, hotel, and high-density housing. But instead of now giving Larkspur credit and a pass for arriving early, densifiers demand, "more, more!" Yet if Larkspur had originally implemented standard suburban low and medium densities at the Landing, probably the Plan's ultimate effect would be to make the area look the way it does now. Because the Landing is already dense, the bar is being raised higher still -- to almost urban-style density, not suburban-style density with ample spacing between buildings, generous parking, and extensive greenery. In short, the Plan's effect would sadly seem to bear out the old saying, "no good deed goes unpunished."

Thank you for considering these comments. Please make every effort to ensure that the Plan EIR considers carefully all legally-cognizable life-quality issues, and avoids 'rosy scenarios,' result-oriented analyses, and what sometimes seems to be cultural bias against suburbia. A comprehensive and careful EIR, hopefully followed by thoughtful reconsideration of densification designs for old suburbs like Larkspur, will be especially productive because, to this longtime observer, the current upwelling of resistance to the Plan's potentially over-reaching aspects resembles nothing so much as the wave of citizen opposition which washed away the plans for massive, dense development of the Headlands and West Marin in the 1960s, along with their promoters and proponents.

C239-8

Sincerely,

James W. Holmes

COMMENT: Draft Plan Bay Area

My Note: The Way to Boil a Frog

The Draft Plan Bay Area reads unlike any US government document I have ever seen. The words *Orwellian*, *Kafkaesque* and *bizarre* repeatedly came to mind as I waded through the report. It has much in common with government communiqués published by the former Soviet Union, Maoist China, and other Statist or totalitarian enterprises. *It is an authoritarian/statist document that empowers radical environmentalism & social justice through legislative/regulatory targets and goals, which will:*

- *Radically transform the development of the region*
- *Undermine our republican political heritage, and*
- *Ensure the progressive diminution of individual civil liberties & free market economic vitality*

It works to achieve this while proclaiming to do the opposite.

To the legislatively mandated goals of SB 375 (outlined below), the authors of Draft Plan Bay Area zealously add additional “voluntary” targets and accompanying performance metrics based on marxist-derived concepts of social justice (which, they note, enhances “**Plan Bay Area’s objective to advance equity in the region.**”)

Most un-bureaucratically, the authors explicitly reference how they “tackled this assignment with enthusiasm”, and applaud themselves for their own “open, inclusive attitude” and their “commitment to analytical rigor.” Tactically, this is propaganda; but it is also the unmitigated glee of the beneficiaries of a statist power grab that, they understand clearly, furthers their own political agenda.

“Equity”, for example – the socially engineered redistribution of Bay Area citizens’ wealth and resources to achieve equalitarian leveling through the coercive power of the State – is understood to be an indisputable social good and merely presented as a given. Your permission, as the hardworking taxpayer who must fund all of this, is not at issue. *They* kindly “outreached” and allowed a miniscule handful of you to offer “input” via carefully stage-managed political theatre events and now your role is simply to pony up. They drive this process; they have legislative & regulatory power (or are aligned with them in public-private partnerships), and *your* role as democratic window-dressing is now fulfilled.

In this way, swathed in Mom-&-Apple-Pie verbiage of “economic efficiency”, “future growth” and “equity”, *Draft Plan Bay Area quietly introduces at a regional level the fundamental transformation the current federal administration works to achieve at a national level.*

If this Draft Plan Bay Area is read superficially, as intended, one barely feels the knife as it slips in.

Making Sense of a Highly-Crafted Piece of Propaganda

Our Founding Fathers designed a *model of competing interests* to ensure no group (particularly no majority faction or coalition) could dominate consistently within a *divided governance structure of checks and balances*.

The elite planner model of the Draft Plan Bay Area, **by contrast**, repeatedly stresses *cooperation, collaboration & consensus* regarding their *planning processes employed to reach legislatively pre-determined outcomes (both statutory and regulatory)*. Orwellian language is used throughout the document to obscure the coercive and totalitarian collectivist nature of what is essentially a power-grab by Statist social engineers.

This plays out in Soviet-style (or Maoist-style, if you prefer) political theatre stressing **community “participation” – a meaningless fiction that provides a diversionary fig leaf to manipulate compliance while moving towards pre-determined & pre-ordained ends**. In the Draft Plan Bay Area socially-engineered outcomes replace the rough & tumble of competing interests & electoral politics – and its inconvenient accountability to voters – substituting, instead, **carefully choreographed political theatre of stakeholder “outreach” & “public participation”**. This begs the question:

- When did “outreach” by unelected bureaucrats, regulators and NGOs become the mechanism by which free Americans govern themselves?
- By what authority do these extra-Constitutional “regional authorities” embodied in regional Councils of Government (COGs) play any role at all?
- Have we chosen to cede our rights as citizens to these unaccountable overseers?

Nowhere amidst the enthusiastic references to a process of “participation”, “collaboration” & “consensus” is there any reference to “voting” or “referenda” by the taxpaying citizens & private property owners (pursuing legitimately diverse private interests) on whose ostensible behalf all this mandatory governmental planning is taking place. **Thus shielded by effusive feel-good rhetoric of harmonious diversity & selflessly omniscient 30-year plans, governance power is quietly transferred from independent citizens to Statist bureaucrats & planners and their allies.**

The Legal & Regulatory Foundation of Draft Plan Bay Area: Global Warming Legislation

Draft Plan Bay Area, and the processes and authority behind it, is based upon and empowered by CA Senate Bill 375. It is therefore crucial to understand this piece of legislation (which is presented only briefly on page 3 of the Plan.) Given that global climate has remained flat for the past 15 years during which time carbon dioxide emissions have increased, it is evident that the massive government intrusion on personal autonomy, civil liberties, private property rights & economic freedom which Draft Plan Bay Area represents is driven by legislation based on dubious (possibly fraudulent) science. **On this shaky foundation rests a wholesale shift to institutionalized central planning by unaccountable California government bureaucrats & rapidly emerging “regional authorities” (and their legislative, elected & non-profit allies) with enforcement powers.** The US Constitution & Bill of Rights appear to crumble before radical-environmentalism-by-legislative-fiat attacking the twin American traditions of individual liberty & free market economics.

California Senate Bill 375

CA SB 375 was signed into law on September 30, 2008 by Republican Governor Arnold Schwarzenegger. The Bill implements a portion of the Global Warming Solutions Act of 2006 (CA Assembly Bill 32):

- AB 32 requires **the reduction of greenhouse gas emissions to 1990 levels** by 2020
 - *Note the central-planning-style diktat, as well as the likely resultant contraction of economic activity – despite deceptive verbiage in Draft Plan Bay Area that ensures this is intended to promote economic growth & governance efficiency.*

SB 375 has 3 major components:

1. Uses the existing regional transportation planning process to achieve reductions in greenhouse gas emissions consistent with AB 32's goals
2. Has a built-in “carrot & stick” approach offering California Environmental Quality Act financial incentives (e.g. waivers, funding, etc.) to create local planning alignment & to ensure projects that do not work to achieve state-mandated goals find it difficult to get funding
3. Marries the regional housing needs allocation process with the regional transportation process, working to achieve full alignment with mandated State targets – or risk funding – while maintaining the (largely hollow) rhetoric of “local authority over land use decisions”

CA SB 375:

- Mandates the reduction of greenhouse gas emissions by:
 1. **Directing general federal transportation funds to projects that reduce the number of vehicle miles traveled per person**
 2. **Assigning specific greenhouse gas reduction targets for each of the 18 designated CA Metropolitan Areas for the years 2020 & 2035**
 - The legislation appoints the *un-elected* California Air Resources Board to determine these mandatory regional targets (see CA Govt. Code § 65080 etc.)
 - The Bay Area's mandated goal for 2020: 7% reduction in miles driven per person
 - The Bay Area's mandated goal for 2035: 15% reduction in miles driven per person
 - *Note again the central planning diktat encroaching upon individual liberty and economic freedom of action*
- Ties *regional transportation planning* to *land-use planning* specifically to achieve mandated:
 - Reduction in the number of vehicle miles traveled per person via
 - Reduction in greenhouse gas emissions from automobiles and light trucks

SB 375: The Basics

SB 375 synchronizes the Regional Housing Need Allocation Process (adopted in the 1980s) with the Regional Transportation Planning Process.

According to Bay Area transportation officials:

- “**SB 375 puts climate protection at the center of land use** and environmental planning in California, combining **accountability for climate impacts of planning decisions** with incentives to build and grow in climate-friendly ways.”
- “**The new law fights global warming** by providing the guidelines for California cities to curb urban sprawl and build communities around transit stations like BART.”
 - *Translation: Personal liberty, economic freedom and local self-governance are being legislated away based on spurious, possibly fake, highly politicized science*
- Transportation accounts for 50% of the Bay Area greenhouse gas emissions
- Studies show people who live in “transit villages” drive 50% less than those who live farther out
- Thus, the most efficient way to reduce greenhouse gas emission is to get people out of their cars

NB: [The most recent research](#) shows that global temperatures have not risen since 1995 during which time global carbon dioxide has risen measurably, undercutting the global warming rationale for AB 32 & SB 375. Even while defending the Manmade Global Warming theories, advocates must concede:

- “The mismatch between rising greenhouse-gas emissions and not-rising temperatures is among the biggest puzzles in climate science just now.” ([The Economist](#), 3/30/2013)

To achieve its mandated goals, SB 375 utilizes the current Metropolitan Planning Organization (MPO) system already in place throughout the state.

- An MPO is a transportation policy-making agency made up of representatives from local government
 - *Note that in Draft Plan Bay Area, SB 375 is referred to as “bottom-up”, and that MPOs engage in “policy-making” controlled by independent “local government officials”*
 - *This is intentionally deceptive, manipulative use of language that obscures the command & control, top-down nature of SB 375. Independent local decision-making that is not in full alignment with SB 375 results in non-funding.*
 - ***There is no meaningful independent “policy making” authority where policy goals & targets – as well as funding – are pre-determined from above. Consistent with the duplicitous verbiage intended to camouflage this fact, local “policy makers” are able to “contribute” and “participate” only in the “bottom up” process of aligning their local plans to meet the demands of bureaucrat planners.***
 - *SB 375 says to local governments, in effect: “You may have any color of phone you like -- so long as it is black.”*
- The MPO exists to ensure that expenditures of federal transportation funds are distributed to local agencies based on a “continuing, cooperative and comprehensive planning process”. In other words, alignment with stated targets is required by the statute in order to receive funding.
 - *Note the coercive punitive power of State funding that will be used to deny funds to regions that display independence from central planning*
- Each MPO is required to meet its emission reduction target by developing a:
 - Regional Sustainable Communities Strategy
 - High-density, mixed-use commercial & residential developments located close to transit corridors
 - ***There is nothing inherently wrong with such development but note that little else can be developed if State-mandated reductions in greenhouse gas emissions & vehicle miles per person are to be achieved over the next 25 years***
 - Regional Growth Plan
 - Regional Transportation Plan
 - Designed to reduce vehicle miles traveled per person

- Required to meet federal & state mandates in order to receive transportation funding
 - *Note the Statist creation of regional entities that have no precedence or voter base. Note also that SB 375 empowers politicians, bureaucrats & planners to deny local citizens federal transportation funds if locally preferred transportation projects are inconsistent with the Regional Sustainable Communities Strategy & its State-mandated goals.*
- To entice local submission to the goals of SB 375 (i.e. sufficient density & proximity to transit corridors) local transportation projects may be prioritized to receive funding if they can achieve designated “Transit Priority Project” status. This requires local projects to meet the following criteria:
 - Minimum 50% of square footage must be designated for residential use
 - Minimum 20 units per acre
 - Located within a half-mile of a major transit stop or a high quality transit corridor
 - The floor/area ratio must be no less than .75
- Note that *if* the local Transit Priority Project meets all the above criteria *and* is consistent with the Regional Sustainable Communities Strategy, the powers that be may bestow Statist benefits:
 - Prioritize it to receive funding, *and*
 - Waive or reduce CA Environmental Quality Act requirements

DRAFT PLAN BAY AREA: The Basics

The Association of Bay Area Governments (ABAG) and the Metropolitan Transportation Commission (MTC) have driven the development of this Plan for the Bay Area. The pre-determined mandated statutory & regulatory targets were in place before the multi-year planning process, thus reducing public “input”, “collaboration” and “participation” to contributing to the deceptive fiction that this was somehow a “bottom up” exercise in independent self-determination & self-governance. **But the outcomes are fixed from the start – and the government carrot & stick compel alignment: the legal and regulatory framework ties funding to the development of high-density housing & commercial activity clustered around public transit corridors** well within existing developed areas, leaving the remaining land to be “open space” or “agricultural” land.

The “implementing framework” for Plan Bay Area consists of:

- 1. Priority Development Areas (PDAs):**
 - “Areas where new development will support the day-to-day needs of residents and workers in a pedestrian–friendly environment served by transit”
- 2. Priority Conservation Areas (PCAs):**
 - “Regionally significant open spaces for which there exists broad consensus for long-term protection but nearer-term development pressure”

Unsurprisingly, Plan Bay Area tells us that as a result of extensive public “outreach” and “input”, we the people have expressed a cooperative and consensual preference for a Land Use Pattern manifested through a Jobs-Housing Connection Strategy that:

- Directs 80% of new housing & 66% of new jobs inside Priority Development Areas (PDAs)
- Limits growth outside the region’s core (i.e. we desire no new growth or development beyond existing developed areas – no new housing or businesses)
- Preserves natural resources and open space
- Reduces greenhouse gas emissions

It may be noted how well this converges upon AB 32 & SB 375 goals as well as Agenda 21/ICLEI plans and objectives, the Sustainability movement, and radical environmentalism in general. All of this is based on the purported need to radically diminish personal liberties to address global warming in the coming 25 years, despite the fact that emerging science increasingly discredits this politicized agenda-driven concept which – like radical environmentalism in general – is internationally wielded as a tool to hamper free-market capitalism.

Personal liberty, the ability to purchase/develop/dispose of private property, free-market economic activity & responsiveness to identified needs, and local citizen sovereignty etc. are all highly constrained for the common good in the world of Plan Bay Area. This is the direct result of central planning more redolent of the FSU than traditional American governing frameworks.

In reality, much of what is planned and projected out 3 decades into the future here would be much better served by *reducing* government regulation & intervention to allow a flexible, unimpeded free market to respond privately to clear social need (e.g. for housing stock at various price points, etc.) *But nowhere in this Plan, which is the culmination of a multi-year region-wide planning process, is the creative & entrepreneurial private free-market – which characterizes the dynamic history & wealth creation of the Bay Area – ever suggested as a potential solution to future Californian social needs or legislated goals.*

Some of the stated Plan objectives might be readily embraced by citizens of all political outlooks (e.g. diminution of industrial particulates, or promotion of efficient public transport, and pedestrian-friendly areas are arguably desirable concepts citizens of a free society might choose to pursue) **but it is the coercive, socially-engineered, centrally planned and authoritarian *processes* that are deeply troubling. *Traditional private property rights – one of the most crucial underlying foundations of our republic, critical to the promotion of individual liberty & freedom from tyranny – virtually disappear for vast numbers of people under Plan Bay Area’s dystopian vision of the future.***

Equally troubling, is the obvious importation of manipulative propaganda techniques familiar to anyone who has studied the Orwellian communication styles of totalitarian societies:

- Based in deception, linguistic framing is employed to influence and direct thought
- Language is used throughout where reality is actually the opposite of what is stated
- Language is not used to extend, but to diminish the readers’ ability to understand, discern or analyze the true strategic objectives
- The plan is peppered with moral language designed to induce agreement even as personal choice is being restricted and channeled through central planning

How does one argue against “collaboration and consensus” without sounding like the Grinch who stole Christmas? And yet it is the competitive process of virtuous private citizens pursuing their own self-interest with the personal liberty to do so that is precisely the system that has protected our freedoms and civil liberties, and maintained our system of self-governance so effectively for more than two centuries.

America is a Republic – one with intentionally and constitutionally *limited* powers granted to government. Manipulative appeals to sentiment, ostensibly charitable “compassion”, moral sanctimony and/or strongly-held collectivist ideals do not over-ride this. Most troubling of all is the fact that this entire process is predicated upon [extra-constitutional entities of “regional governance”](#) that have empowered bureaucrat planners at the expense of citizens and our republican form of government. How did ABAG & MTC – and the myriad regional Councils of Government (COGs) nationwide – take unaccountable ownership of our rights of self-governance?

Many of the goals, processes, and techniques embodied in the Draft Plan Bay Area appear to obscure fairly “un-American” agendas appearing more socialist, trans-nationalist, anti-capitalist, anti-private property, and anti-civil rights. **Despite the pretty language, this is an old Progressive model that offers linguistic window-dressing to obscure a well-managed process with a pre-determined outcome and an inverted governance model: Our governing, legislative and regulatory bodies in SB 375 and Plan Bay Area do not exist primarily to serve us, rather we exist to serve (and finance) the government, its elite planners and their social engineering agenda.**

PLAN BAY AREA PERFORMANCE TARGETS		
GOAL/OUTCOME	ADOPTED TARGET	PROJECTED ACHIEVEMENT
Required		
1) Climate Protection	Per SB 375: Reduce CO2 emissions from cars/light trucks by 15% per-capita by 2035	Plan exceeds target. 40% reduction by 2040
2) Adequate Housing	Per SB 375: House 100% of projected population, by income level, w/o displacing low-income residents	Plan meets target
Voluntary		
3) Health & Safety	Reduce premature deaths from exposure to particulate emissions: <ul style="list-style-type: none"> 3A: By a 10% reduction in fine particulates (PM2.5) 3B: By a 30% reduction in coarse particulates (PM10) 3C: Achieve greater reductions in highly impacted areas 	<ul style="list-style-type: none"> 3A Exceeds target (71%) 3B Won't meet target (17%) 3C Meets target
4) Health & Safety	Reduce collision injuries/fatalities (cars, bikes, pedestrians) by 50%	Projected 18% increase
5) Health & Safety	Increase avg per person daily walking/biking transportation time by 70% (= avg 15 minutes per person per day)	Projected 17% increase
6) Open Space & Agricultural Preservation	Contain all non-agricultural development within existing urban boundaries for the next 28 years (using 2010 as baseline)	Plan meets target
7) Equitable Access	Decrease avg % of income devoted to housing/transportation among low/lower-middle income HHs (to 56% from 66%)	Avg expected to rise to 69% for target population
8) Economic Vitality	Increase Gross Regional Product (GRP) by 110%	119% GRP projected by 2035
9) Transportation System Effectiveness	<ul style="list-style-type: none"> Decrease per capita vehicle miles by 10% Increase per capita non-vehicle travel (to 26% from 16%) 	<ul style="list-style-type: none"> Projected 9% decrease Projected increase to 20%
10) Transportation System Effectiveness	Maintain existing transport system in good repair: <ul style="list-style-type: none"> 10A: Increase road Pavement Condition Index (PCI) to 75 10B: Decrease distressed state highway lane-miles to less than 10% of total lane-miles 10C: Reduce share of post-useful-life transit assets to 0% 	<ul style="list-style-type: none"> 10A: Projected PCI of 68 10B: Projected rise to 44% by 2040 10C: Projected rise to 24%
NB: MTC & ABAG pro-actively further invented “Equity Measures” targeting “communities of concern”. The Planners noted: “Indeed, a commitment to achieving equity in the long-range planning process is a key element of the Plan.” TRANSLATION: Above & beyond SB 375, our political agenda -- to socially engineer the achievement of our definition of equalitarian Social Justice through redistribution of the private & public wealth & resources of Bay Area citizens -- is a key element of the Plan		
11) Housing & Transportation Affordability	% of income spent on housing & transportation by low-income HHs	No significant change projected on any of these metrics (see Draft Plan Bay Area p. 109 for details)
12) Potential for Displacement	% of rent-burdened HHs in high-growth areas	
13) Healthy Communities	Avg daily vehicle miles traveled per populated square mile within 1,000 feet of heavily used roadways	
14) Access to Jobs	Avg commute travel time (in minutes)	
15) Equitable Mobility	Avg non-work travel time (in minutes)	

DRAFT PLAN BAY AREA: Tactical Approaches to Larger Strategic Goals

Legislation such as SB 375 & AB 32, together with State-issued regulations mandating specific performance targets, appear to be harnessed by the State/Regional/Local planners to:

- **Direct massive wealth redistribution *without accountability to the taxpaying citizens at the local/state/federal levels who must fund their schemes***
- **Push for changes to the California State Constitution to ensure *permanent (and thus unaccountable to taxpayers) ongoing funding***
- Undermine the sovereignty, personal liberty & self-determination of free citizens
- Erode private property rights & free-markets
- Over-ride traditional citizen-empowered republican model of representative self-governance
- Transfer power:
 - From bottom-up to top-down
 - Away from increasingly dis-empowered private citizens/taxpayers/voters
 - Toward increasingly empowered State/unaccountable bureaucrats/elite planners
 - Inverting the alignment of government with the interests of citizens to the alignment of citizens with the interests of The State
- Oversee the expanding process of turning Citizens into Subjects (of the State)
- Bring to bear the coercive & punitive powers of the State apparatus to pre-determine, dictate and prosecute the acceptable range of human choices & behaviors:
 - Across a Planner-defined set of Performance Metrics
 - In the areas of:
 - Land Use
 - Transportation
 - Housing
 - Economic growth and/or contraction
 - “Equity” (i.e. redistribution of wealth & resources to achieve equalitarian leveling)
 - “Environmental Justice” & “Sustainability”
 - Global Warming

Re: Public Comment on Draft Plan Bay Area and Draft Plan Bay Area Draft
Environmental Impact Report

To Whom It May Concern,

My name is Stephen Nestel.

I am a resident of Marinwood, located in unincorporated Marin County. I support and adopt a letter to you by a fellow member of my community, Lisa Culbertson as follows:

I am writing to comment on the Draft Plan Bay Area (The plan) and Draft Plan Bay Area Draft Environmental Impact Report (DEIR).

I submitted a request for an extension of time to review the Plan and DEIR, which was not granted. These are complex and difficult documents for ordinary people to understand. The level of communication with the communities you are impacting by this plan is disgraceful. The plan includes a statement, "We reached out to the people who matter most – the 7 million people who live in the region." This is inaccurate as it pertains to my community, Marinwood, designated as a potential Planned Development Area (PDA). Many members of the Marinwood community do not know what Plan Bay Area is and for most that do, they have only heard about it in the past few weeks. I attended one of two planned meetings in my community where there was no verbal presentation or explanation of the plan, but rather boards and remarks from the public. I ask that you reconsider this fast track approach and take the time to educate the community on exactly what it is that you are proposing in this plan and why.

I support truly sustainable land use and development that preserves the qualities of existing neighborhoods. I support additional affordable public transportation that reaches a greater range of areas throughout the Bay Area and operates more frequently with longer hours. I also support a range of housing opportunities, integrated into existing communities that do not adversely affect those communities through expediting environmental and permit review and not contributing a fair share to the tax base. None of these things are supported by this plan and therefore you do not have my support. I vote for no plan and ask that you remove Marinwood as a potential PDA designation.

Although I am writing this letter representing myself, I have spent the past two weeks walking door to door gathering signatures against the proposed development plans affecting Marinwood and Lucas Valley. 90% of the homes visited by myself and fellow neighbors are NOT in support of this plan or the related Housing Element. Since this plan is voluntary and you do not have the support of the Marinwood/ Lucas Valley community I ask again that you remove Marinwood as a potential PDA designation.

I have grave concerns about the environmental, health and safety impacts that could result from the poor land use planning that I see presented in this plan as well as other related

plans, such as the Marin County Housing Element. There are numerous holes and inconsistencies in the Plan Bay Area and DEIR which are the basis of my comments that follow:

Unrealistic employment growth

Projected employment growth in Marin County is half of what is being proposed for housing growth. The largest Bay Area job growth is assumed in major cities and areas such as Silicon Valley that have established industries such as technology. Marin County is not known for any specific industry. For its size, Marin County has very few large scale employers and a low number of high paying jobs compared to the number of residents and high cost of living. The potential growth in local employment projections are assumed to be coming from professional services and retail.

Marin had the largest job growth from 1980 to 1990. In 2011, employment levels were about the same as they were in 1990. There are documented studies that project a relatively flat growth in jobs in Marin County over the next 30 years. The lack of consistency and equality between the housing and job numbers projected in Marin County will lead to more commuters, thus increasing green house gas (GHG) emissions as there will not be enough jobs for the number of residents moving into the county. This will hurt the workforce that these plans aim to protect as there will be more competition for available jobs and low income earners will not have ample salaries to pay for the high price of transportation to travel to employment throughout the Bay Area.

The lack of continuous transportation will also affect quality of life for those depending on public transportation as it can take hours to get from point A to B if multiple modes of transportation are to be used. In addition, the Housing Element appears to designate almost every available parcel in Marin for housing, not leaving properties available for commercial development. Furthermore, the proposals for mixed use projects do not have an equal balance between jobs and housing.

The discussions around new jobs in Marin have been more focused on filling vacancies than creating new development. This does not leave opportunity for the creation of jobs in areas where housing is being considered. A perfect example of this is the Marinwood area, which has minimal jobs in the near vicinity and yet the projected housing number far exceeds any potential commercial development within the area.

Due to the fact that job growth in Marin will likely remain flat and the available capacity for jobs to increase is unlikely, I ask that The Plan Bay Area be revised to include realistic employment projections by area and a specific plan for achieving those projections. I ask that the plan take into account not only the workforce commuting into Marin County for employment, but all commuters into, out of and through Marin County. The approach taken in this plan is shortsighted and not representative of all current commute patterns.

Unrealistic Housing numbers

Like the job numbers, the housing numbers also appear to be unrealistic. The January 2013 release of the State Department of Finance (DOF) projections of Marin County's population growth are 10% lower than the growth forecast used for Plan Bay Area. Plan Bay Area forecasts a 13% population growth to 2040 (32,914 more people) but DOF projects a 3% population growth (6,818 more people). This is a significant discrepancy. The Plan Bay Area and the DEIR should be revised to reflect population growth based on DOF projections, not that of an independent consultant hired by ABAG.

The plan needs to include an assessment of the total cost to the County and taxpayers incurred by adding housing. This assessment should include additional services (schools, water, fire, police, ambulance...) and the total cost of development including subsidies to developers and loss of tax base.

The housing assumptions do not reflect accurately the desire of a large group of people to

maintain living in rural areas and in single family homes. It makes the assumption that the future housing preference is high density, mixed use housing, located in urban areas. While both are desirable to different groups of people, the plan is not representative of all type of housing desires. I request that the plan be modified to accurately represent the desires for all types of housing.

Inadequate evidence that high density housing near transit reduces green house gases (GHG)

Not only is there no evidence provided that proves placing housing near transit reduces GHG, there is also no analysis validating assumptions that people who move to high density housing near transit will be more likely to take public transit. These ideas or goals focus too much on strategies, which are not valid, and should be substantiated with factual information.

This plan does not take into consideration accurate travel needs, preferences and behaviors and the fact that for many people the preferred mode of travel is by car. The plan does not indicate what other studies have been put forward other than a "one size fits all" determination made by the authors of this plan stating how people are expected to travel. This makes grand assumptions that are unrealistic and should not be used as the basis of such a widespread and impactful plan.

I ask that you provide the analysis to prove that the housing near transit lowers GHG emissions, at what cost and what other options are available to achieve the same results.

Inadequate evidence that the transportation plan reduces GHG

It seems that there are other ways to reduce GHG emissions that should be analyzed as having a potentially more significant impact on reduction than what is being proposed in Plan Bay Area. These options include considering the future automobile technology and incentivizing individuals for the highest fuel efficient cars. Focus on creating a much higher number of localized jobs in Marin County to allow for more existing residents to work close to home rather than just focusing on housing for those commuting into Marin.

Further studies and factual information should be presented to substantiate that switching people from cars to public transit will in fact decrease CO2 emissions, rather than increase emissions. More information is needed on the types of transportation being proposed and a comparison between the emissions from the public transit vs. cars. The Plan focuses on GHG emissions from personal vehicles and light trucks and does not focus on technology improvements made to other forms of transportation including busses, ferries, trains, etc. An assessment should be performed on the potential for reductions by replacing fleets of other modes of transportation and the cost benefit should be analyzed against the plan as currently proposed.

The plan identifies that the "no project" alternative is projected to reduce passenger vehicles CO2 emissions by 23% by 2040 over the existing condition in 2010. The proposed alternative, which is costly and intrusive into basic economic and personal freedoms, is projected to reduce emissions by 25%. The plan does not consider if this extra 2% is worth the additional costs. I ask that a cost benefit analysis be prepared and incorporated into the findings, which includes other options to reach the additional 2% GHG emissions.

Inadequate evidence that placing high density housing next to major transportation corridors will not have significant adverse health effects on those residents.

The Plan proposes placement of housing along transportation corridors, where the objective is to locate jobs and housing in close proximity to each other, with the goal of reducing automobile trips and therefore mobile source emissions. However, in doing so sensitive receptors will be exposed to unhealthy levels of toxic air or particulate concentrations. The DEIR does not provide adequate mitigations to protect sensitive receptors, especially those spending time outdoors, such as children playing outside. The DEIR states: "New research on the health effects of TACs and PM2.5 reinforces earlier findings regarding adverse health impacts on both respiratory and cardiovascular health but also a wider range of potential

effects, such as diabetes, autism, cognitive functions in older adults, and oxidative damage to DNA. In addition, US EPA has not identified a level of TAC/ PM2.5 concentration where no negative health effects are observed." There are many reports not disclosed or discussed in the plan that identify causal links between proximity to freeways and highways, asthma, autism and cancer. This should be highlighted as a risk in the plan and study references included.

Implementation of Plan Bay Area would subject sensitive receptors to a significant increased risk of developing life-threatening illnesses from toxic air contaminants and particulate matter emissions. Furthermore, the measures listed to mitigate these significant impacts are inadequate to reduce them to less than significant levels, particularly in regard to protecting sensitive receptors that spend time outdoors. Plan Bay Area's proposal to target residential development in close proximity to highly travelled and congested roadways is irresponsible land use planning and conflicts with CEQA. Case law clearly shows that CEQA is intended "to compel government at all levels to make decisions with environmental consequences in mind." I ask that you revise Draft Plan Bay Area and remove all proposed residential development from areas that are located within the zone of influence of toxic air contaminants and/or fine particulate matter emission sources and remove areas situated within the zone of influence of these emissions from Transit Priority Project corridors, Priority Development Areas and Potential Priority Development Areas.

Plan does not sufficiently consider that traffic congestion adds to CO2 emissions
The Plan Bay Area does not consider cumulative effects of increased localized traffic. The lack of expansion of the road network will cause an increase in traffic congestion as areas grow more dense. Instead the methodology of this Plan places an over-emphasis on public transit. In reality, congestion will increase, and the resulting standing or slow traffic will cause additional CO2 emissions per passenger mile for the most used form of transit cars and light trucks.

Furthermore the plan does not adequately take into consideration the impact of the time wasted from traffic congestion and the effects on quality of life. The Plan Bay Area does not account for typical family life, taking children to and from school, sports, errands, etc., it only focuses on trying to change the norm. Congested roadways will result in a reduction in the distance that most residents can effectively commute, due to time and family constraints. This in turn means that people are less able to find employment within an acceptable distance.

I ask that the Plan Bay Area be revised to take into consideration additional, localized traffic especially in areas where increases in housing are not balanced with job growth.

Plan fails to disclose subsidization required to encourage residents to move to high density development near transit

The Plan Bay Area fails to identify the true amount of subsidization required to encourage builders to develop high density housing. A survey by the National Association of Realtors in 2011 reveals that the vast majority of Americans prefer to live in single-family homes with privacy and yards.

Evidence exists that subsidies are required in order to encourage people to move to high density housing. There is no analysis included in the Plan to validate the amount of subsidization required to encourage developers to initiate and complete such projects and residents to move into them.

This lack of specificity means that an undefined amount of public money, via state, county or city, will be used to reach the goals of this plan. The plan does not alert readers to rising taxes needed to raise revenue to cover these subsidies. Alternatively the plan does not provide sufficient analysis of impacts to services such as police, fire and schools. In addition, there is no evidence that the expenditures covered by the plan will achieve the stated goals.

Inadequate information re: water supply, sea level rise, and support for infrastructure
There are 5 significant, irreversible environmental changes, and 39 significant unavoidable impacts of the plan, identified in the DEIR, that should be addressed and mitigated before this plan is accepted. They should not be dismissed with findings of "overriding consideration." If the organizations that are proposing to implement this plan cannot address these serious affects than perhaps that is a sign that this is not the right plan for the Bay Area. The impacts I am referring to include:

- Insufficient water supply;
- Exposure to hazardous materials;
- Inadequate wastewater treatment capacity;
- Net Increase in Sensitive Receptors located in Transit Priority Project corridors where there are high concentrations of cancer causing Toxic Air Contaminants and fine particulate matter emissions;
- Inundation from sea level rise;
- Direct removal, filling or hydrological interruption of habitat;
- Interference with the movement of native resident or migratory fish or wildlife species.

Plan Bay Area Approval

It is unclear to me how the Plan Bay Area ultimately gets approved and implemented. I request that this be clarified to the population impacted by the Plan. Is the plan subject to voter approval?

Conclusion

The Draft Plan Bay Area's DEIR is inadequate in numerous instances identified in this comment letter. ABAG must prepare an EIR that adequately analyzes the plans significant impact and meets CEQA guidelines. The conclusions are not supported by substantial evidence. The key assumption regarding population and job growth is inaccurate. A revised EIR should be prepared and circulated for public review and with ample time given to the public to comment.

Thank you,
Stephen Nestel

3.7 Individual Responses

Letter C1 Charles Steiner (4/2/2013)

- C1-1: Please see Section 1 of this Final EIR for a description of the public review process for the Draft EIR. CEQA does not require public hearings for an EIR, however three public meetings were held across the region as a courtesy for those wishing to submit their comments orally. Two of these meetings were in close proximity to San Francisco, in San Rafael and in Oakland, the latter readily accessible by BART. In addition, a public meeting announced on the OneBayArea website was held in San Francisco on April 11, 2013 at the Whitcomb Hotel, 1231 Market Street, on the Draft Plan; oral comments could have been submitted on the EIR at that meeting.
- C1-2: Please refer to Master Response C on requests for extensions of the public comment period.

Letter C2 Linda Graber (4/3/2013)

- C2-1: Please refer to Master Response C on requests for extensions of the public comment period. MTC and ABAG are required to respond in writing to all of the comments submitted and provide substantive answers, make changes to the EIR and proposed Plan when warranted, and consider these comments during the process to adopt Plan Bay Area.

Letter C3 Ken Bone (4/11/2013)

- C3-1: The proposed Plan aims to preserve open space to the greatest extent feasible by promoting concentration of development in existing urbanized areas. However, land use development decisions are ultimately under the purview of local jurisdictions; please refer to Master Response A.1 for more information on local land use control. It is beyond the scope of this EIR to create a funding program for protected open space region-wide. See Master Response A.3 regarding level of specificity in the EIR. See also response A20-5.
- C3-2: The comment states that animal migration corridors and riparian native Oakland forest corridors must be reestablished and maintained along all waterways with designated funding in all nine counties. While it is beyond the scope of this program-level EIR to fund or establish such a program, mitigation measures for impacts to biological resources, including riparian habitat, are set forth in chapter 9 of the Draft EIR (see Mitigation Measure 2.9(d) on p. 2.9-71). Project-specific restoration and funding would be evaluated on a project-by-project basis under subsequent environmental review by the implementing agency.

Letter C4 Val Stuckey (4/15/2013)

- C4-1: For projects that were not identified as high performing in the Plan Bay Area Project Performance Assessment (refer to the associated supplemental report), county Congestion Management Agencies (CMAs) developed project funding lists given the financial constraints of Plan Bay Area. Due to the high cost of this project, Alameda County Transportation Commission recommended to MTC that \$617 million (only a portion of the project's total construction costs) be allocated for project studies and future construction reserves for a future BART extension to Livermore. ACTC's recommendation is reflected in

the Draft Plan Bay Area Transportation Investment Strategy. While this funding level does preclude construction of the BART to Livermore extension under Plan Bay Area, it does allow for continued project study and design work, which are the next steps for this particular project.

Letter C5 Marin Residents (5/17/2013)

- C5-1: Please refer to Master Response C regarding requests for extensions of the comment period. As the comment does not cite specific instances of “inadequacies, oversights, and incorrect assumptions,” MTC and ABAG are not able to provide detailed responses. Regarding greenhouse gas emissions, the Draft EIR, Chapter 2.5, shows that the proposed Plan meets all of the related thresholds of significance. See Master Response D.1 for more information regarding SB 375 GHG reduction targets.
- C5-2: This comment does not raise environmental issues requiring a response under CEQA.
- C5-3: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.
- C5-4: This comment does not raise environmental issues requiring a response under CEQA.
- C5-5: These comments appear to be on the Marin Housing Element. This EIR only addresses Plan Bay Area.
- C5-6: Please refer to Master Response C regarding requests for extensions of the comment period. Some of this comment appears to be on the Marin Housing Element. This EIR only addresses Plan Bay Area. Regarding noticing of the Plan Bay Area, see response C5-3.
- C5-7: Please refer to Master Responses B.1 on population projections and D.2 regarding the connection between high-density housing near transit and reduced greenhouse gas emissions. The amount of residential growth distributed to Marin County under the proposed Plan is about 8,800 households over 30 years, or less than 300 new households annually for the entire County. Furthermore, per Table 3.1-3 of the Draft EIR, Marin County’s expected 2040 population under the proposed Plan (112,021) is just 512 more people than expected under the No Project alternative (111,509).

The regional land use Plan, or distribution of growth to individual jurisdictions is a blueprint for growth to achieve the goals and objectives of the Sustainable Communities Strategy (SCS) and was developed through a variety of land use and transportation scenarios that distributed the total amount of growth forecasted for the region to specific locations. These scenarios sought to address the needs and aspirations of each Bay Area jurisdiction, as identified in locally adopted general plans and zoning ordinances, while meeting Plan Bay Area performance targets adopted by the agencies to guide and gauge the region’s future growth. ABAG and MTC incorporated local feedback from individual jurisdictions relying on their best assessment of feasible growth over the plan period and then applied a series of additional factors to achieve the goals of the SCS. The scenarios were then developed through a transparent, deliberative process, during which public input was sought at every

step along the way. After further modeling, analysis and public engagement, the five initial scenarios were narrowed down to a single preferred land use scenario. For more on how the proposed Plan distributed projected regional growth, see the Supplemental Report *Forecast of Jobs, Population and Housing*.

- C5-8: See Master Response F regarding displacement. Please refer to Master Response G for more information on water supply. Infrastructure capacity is addressed in Chapter 2.12, Public Utilities, of the Draft EIR.
- C5-9: MTC and ABAG acknowledge that the EIR finds significant and unavoidable impacts associated with the proposed Plan; however, it should be noted that the Plan performs better than the no project scenario. The MTC and ABAG Board will determine whether to approve the Plan in light of these findings.
- C5-10: Please refer to Master Response C regarding requests for extensions of the comment period.
- C5-11: See response C5-3 and please refer to Master Response C regarding requests for extensions of the comment period.
- C5-12: Your opposition to the proposed Plan is acknowledged. Please see Master Response C regarding requests for extension of the comment period.
- C5-13: Please refer to Master Response C regarding requests for extensions of the comment period. Additionally, the proposed Plan does not result in any zoning changes to local jurisdictions. Zoning decisions remain under the control of individual local governments. For more information regarding local control over land use, please see Master Response A.1. This EIR only addresses Plan Bay Area and has no influence over the Marin Housing Element.
- C5-14: No letter was received from Geoffrey Hornek on this EIR, but see responses to Sharon Rushton's letter, C33.
- C5-15: See response C5-13.

Letter C6 John Shirley (4/20/2013)

- C6-1: See response to C4-1 above.

Letter C7 Linda Jeffery Sailors (4/21/2013)

- C7-1: See response to C4-1 above.

Letter C8 Deana Dearborn (4/25/2013)

- C8-1: Please refer to Master Response C on requests for extensions of the public comment period.

Letter C9 Sarah Azerad (4/26/2013)

- C9-1: Please refer to Master Response C on requests for extensions of the public comment period.

Letter C10 Denise Castellucci (4/26/2013)

C10-1: Please refer to Master Response C on requests for extensions of the public comment period.

Letter C11 Justin Kai (4/26/2013)

C11-1: Please refer to Master Response C on requests for extensions of the public comment period.

Letter C12 Rebecca Andersen (5/6/2013)

C12-1: Please refer to Master Response C on requests for extensions of the public comment period.

C12-2: See Master Response B.1 for information on population projections. The proposed Plan's anticipated impacts on schools were addressed in chapter 2.14 (Public Services and Recreation) of the Draft EIR, and impacts to water supply and wastewater treatment facilities were addressed in Chapter 2.12 (Public Utilities and Facilities) of the Draft EIR. Please also see Master Response A.3 regarding the specificity of a program EIR.

C12-3: The commenter's perception that the proposed Plan prioritizes housing development over job growth is not an impact that requires analysis under CEQA.

C12-4: Commenter states that transportation infrastructure investments should precede housing development. See Master Responses A.1 and A.3 regarding local control over land use planning and the level of specificity in the EIR.

C12-5: The proposed Plan does not rezone Marin to urban density. The proposed Plan envisions limited development consistent with the existing scale of Marin's communities. Neither MTC nor ABAG has authority over local land use decisions. See Master Response A.1 on local control of land use.

C12-6: See Master Response A.1 regarding local control over land use authority.

Letter C13 Kim Natuk (4/26/2013)

C13-1: Please refer to Master Response C on requests for extensions of the public comment period.

Letter C14 Eileen Vergino (4/26/2013)

C14-1: See response to C4-1 above.

Letter C15 Walter Natuk (4/27/2013)

C15-1: Please refer to Master Response C on requests for extensions of the public comment period.

Letter C16 Jon Spangler (4/27/2013)

C16-1: Please refer to Master Response C on requests for extensions of the public comment period.

Letter C17 Rebecca Lapedus (4/29/2013)

C17-1: Please refer to Master Response C on requests for extensions of the public comment period.

C17-2: Per your request, MTC and ABAG have created an expanded glossary of terms, including a brief definition of each. The glossary can be found in Appendix A of this Final EIR.

C17-3: MTC and ABAG will consider the request. Many of the materials cited are available on the website onebayarea.org.

Letter C18 Athena McEwan (4/29/2013)

C18-1: The Priority Development Area referenced in the comment—the Urbanized 101 Corridor in unincorporated Marin County—was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. The boundaries of this PDA were determined by the County of Marin. The PDA was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors. See Master Response I regarding the PDA process. See Master Response A.1 regarding local control over land use.

Letter C19 Muriel Benedetti (5/4/2013)

C19-1: Please refer to Master Response C on requests for extensions of the public comment period and see responses to C12-1 through C12-7 above.

Letter C20 John Castellucci (5/3/2013)

C20-1: Please refer to Master Response C on requests for extensions of the public comment period and see responses to C12-1 through C12-7 above.

Letter C21 Libby Lucas (4/30/2013)

C21-1: The list of libraries to which MTC and ABAG delivered copies of the proposed Plan and Draft EIR, either printed or on CD-ROM, is included in Section 1 of the Final EIR. A full copy of the Plan and the Draft EIR can be found on the OneBayArea website and were available for review at the MTC-ABAG Library. This is to ensure that the public has full access to the Plan and the Draft EIR. Public hearings for both the Plan and Draft EIR were open to all members of the public. Please refer to Master Response C on requests for extensions of the public comment period.

Letter C22 K. Rose Hillson (5/1/2013)

C22-1: This EIR describes the environmental setting for the land use analysis in the opening sections of Chapter 2.2 and includes maps of urbanized land, showing what land is developed for human habitation. In fact, the EIR states that only 17.8 percent of the approximately 4.4 million acres in the nine-county region represent urbanized land. This is the amount of urbanized land that is analyzed in this EIR.

C22-2: The data presented in Chapter 2.3 is for a 2010 base year, as confirmed in the source reference for Table 2.3-1 and in the footnote on page 2.3-2.

C22-3: See Master Response F regarding displacement.

- C22-4: Figure 1 in the *Draft Summary of Predicted Traveler Responses*¹ summarizes the Bay Area's population today and in 2040 by "person type" categories. Counter to the speculation presented in the comment, the expected increase in population between 2010 and 2040 is not exclusively made up of single individuals. The subsequent speculation in the comment is, therefore, unfounded. The unemployment numbers speculated by the commenter are not correct. People who live outside of San Francisco that do not have jobs in San Francisco would not be expected to commute to San Francisco.
- C22-5: Your opposition to Alternative 4 and Alternative 5 is acknowledged. The commenter states that the assumption in Alternative 4 that no one will in-commute into the region is not practical. MTC and ABAG agree that fully eliminating the in-commute from surrounding regions may not be practical. The proposed Plan therefore includes a growth pattern that stops the rate of people commuting into the region from increasing. MTC and ABAG believe that approach is achievable and beneficial to the region and the neighboring regions.
- C22-6: MTC and ABAG are not proposing implementation of a Vehicle Miles Traveled (VMT) tax as part of the proposed Plan. The VMT tax was included in Alternative 5, the Environment, Equity and Jobs Alternative, as per the direction of the stakeholders who developed that alternative. Page 3.1-8 of the Draft EIR does note that "exemptions from the tax would be provided for low-income households."
- C22-7: This comment does not raise environmental concerns under CEQA. Communities of Concern are low income and minority communities defined by MTC as experiencing potential transportation accessibility disparities. See responses C22-1 and C22-2 regarding the last sentence.
- C22-8: The California Air Resources Board selected the year 2005 as a baseline (see pp. 6 in the *Recommendations of the Regional Targets Advisory Committee*²) in September 2009. In 2009, sufficient information was not available to establish 2010 as the base year.
- C22-9: See responses C22-1 and C22-8.
- C22-10: The term "pre-recession" normally refers to 2008 and the preceding years of economic growth. MTC and ABAG acknowledge that there may have been subregional differences and ABAG takes these into account in its long range population and job projections. There is a robust analysis process that precedes each round of regional projections; see Master Response B.1 for additional information on population projections.
- C22-11: The Draft EIR uses the 2010 base year because the U.S Census was conducted at that time, and it provides a detailed dataset on which to build an analysis of potential environmental effects. Much of the regional land use and transportation data used for modeling also was calibrated to this base year. Adjustments in future unemployment rates were made to reflect a return to more balanced growth over the planning period. MTC and ABAG believe that these long range forecasts provide the best analytical framework available for this EIR. See Master Response B.1 for additional information on population projections.

¹ http://onebayarea.org/pdf/Draft_Plan_Bay_Area/Draft_PBA_Summary_of_Predicted_Traveler_Responses.pdf

² <http://www.arb.ca.gov/cc/sb375/rtac/report/092909/finalreport.pdf>

- C22-12: This typo in the heading is acknowledged and has been corrected in Section 2 of this Final EIR.
- C22-13: This EIR uses a base year and then a 28 year planning horizon because those are the time periods set in the proposed Plan. The current eight year cycle for Regional Housing Needs Allocations is set in SB 375 and is independent of the EIR analysis. Additional information about housing elements and update cycles is available on the California Department of Housing and Community Development website's housing element page: <http://www.hcd.ca.gov/hpd/hrc/plan/he/>
- C22-14: The comment correctly notes that commute travel mode shares for the San Francisco Bay Area have remained fairly constant between 1990 and 2010, with 68 percent of residents driving alone to work. This is primarily a result of household growth over the past two decades being concentrated in suburban and exurban areas; residents in these locations generally lack public transit options. Historical public transit investments have served to maintain transit mode share by increasing total system ridership, but any potential mode share gains have been overwhelmed by the continued expansion of auto-dependent land use patterns.
- Because the proposed Plan focuses future residential and employment growth into the urban core of the region, and combines this growth with supportive public transit investments, it is forecasted to have a greater impact on expanding the region's transit mode share, as shown in Table 2.1-13. Note that the majority of the region's trips in year 2040 are still expected to require an automobile, but transit trips nearly double over the lifespan of the proposed Plan as a result of the focused growth pattern and public transit expansion.
- C22-15: The transportation strategies included in the proposed Plan are not targeted to discriminate against specific races or ethnicities.
- C22-16: This EIR did analyze displacement related to the proposed Plan; see pgs. 2.3-35 to 2.3-40. This EIR did not evaluate displacement caused by speculators buying single-family homes as the concern is speculative and is not a potential environmental effect directly or indirectly related to the proposed Plan. See Master Response F for additional information on displacement.
- C22-17: The statement questioned is the conclusion from the analysis presented on the preceding pages. A geographic information system with mapped data on land use was used to evaluate how proposed transportation projects and land use development would affect existing residents and businesses. The findings from this analysis are represented in the summary statement quoted.
- C22-18: This comment correctly states heavy duty diesel trucks can create noise impacts. Construction noise is analyzed under Impact 2.6-1 on pg. 2.6-21 *et seq.* and Mitigation Measures 2.6(a) and 2.6(b) lists a number of noise attenuation measures that would reduce or eliminate the impact noted in the comment. Because MTC and ABAG cannot compel local agencies to adopt the mitigation measures listed, the localized impact of local projects, as opposed to regional projects, would remain significant and unavoidable.
- C22-19: Potential displacement is not anticipated due to noise impacts from the regional transportation projects in the proposed Plan. In addition, local General Plans must have

noise elements, which establish standards and policies to avoid adverse noise impacts due to local construction impacts. See Master Response A.1 regarding local land use control.

- C22-20: Increased noise levels are described and analyzed under Impact 2.6-2. Mitigation Measure 2.6(d) lists a number of noise attenuation measures that would reduce or eliminate the impact noted in the comment. If these measures were adopted and implemented, the impact would become less than significant.
- C22-21: The anticipated population increase in the region will occur with or without the proposed Plan; see Master Response B.1 regarding population projections. Chapter 2.7, Geology and Seismicity, includes a detailed analysis of land within Alquist-Priolo zones under Impact 2.7-1 and documents the acreage in Priority Development Areas (PDAs) that lies within these zones and would potentially be affected by a major seismic event. The impact is identified as potentially significant, and mitigation measures are listed. This is normal practice in an environmental assessment: to disclose whether more people or structures would be at risk due to a seismic event causing ground rupture. Events related to ground-shaking, liquefaction and landslides are also examined in the EIR. The comment is correct in noting that implementation of the proposed Plan by implementing agencies would put some additional people's lives at risk compared to existing conditions, but that is essentially due to the population growth and all of the project alternatives including the No Project alternative have the same impact; whether there is enough open space land to bury them or facilities to cremate them is speculative and beyond the programmatic scope of this EIR.
- Not only does the Draft EIR include a detailed discussion of geology and seismicity impacts, but a recently published CEQA decision demonstrates that impacts of earthquakes on a project "do not relate to environmental impacts under CEQA" and are not required to "be analyzed in an EIR." (*Ballona Wetlands Land Trust v. City of Los Angeles* (2011) 201 Cal.App.4th 455, 475 (*Ballona*).) The court reached this conclusion because "the purpose of an EIR is to identify the significant effects of a project on the environment, not the significant effects of the environment on the project." (*Id.* at p. 473.)
- C22-22: Water supply issues are fully treated to a program-level assessment in Chapter 2.12, Public Utilities; see Master Response G for additional information. Large scale residential development must be assured of having adequate long-term water supplies prior to a development approval, and urban water management plans must take account of supply interruptions due to drought years. Effects of emergencies are analyzed at a programmatic level in Chapter 2.13, Hazards. See Master Response A.3 regarding level of specificity in the EIR.
- C22-23: MTC and ABAG respectfully disagree with the suggestion that potential groundwater pollution related to transportation impacts and land development under the proposed Plan has not been thoroughly covered. The programmatic assessment presented in Chapter 2.8, Water Resources. Effects on groundwater recharge are found to be less than significant (see pg. 2.8-27). However, pollutants from non-point sources could affect water quality, so Mitigation Measure 2.8(a) is included. With incorporation of these measures, the impact is found to be less than significant. The comment is correct to note that blending of water from various sources may occur, but attributing a change in taste to the proposed Plan would be speculative. Therefore, no change in this EIR is proposed to address the comment.

- C22-24: Chapter 2.8 of the Draft EIR, under Impact 2.8-2, analyzes whether the proposed Plan could, “substantially interfere with or reduce rates of groundwater recharge due to the increased amount of impervious surfaces, such that there could be a net deficit in aquifer volume or a lowering of the groundwater table,” and found the impact to be less than significant. Chapter 2.12, Public Utilities and Facilities, includes a programmatic assessment of long-term water supplies and notes that some water suppliers may need to supplement their long-term supplies with imported water or adopted additional water conservation, reuse or recycling measures. Reference to imported water in this context means surface water supplies, not overdrafting a groundwater aquifer. As this is a programmatic assessment, the summary of projected water shortages in Table 2.12-4 is on an agency level, and not broken down to PDAs. Furthermore, decisions on water sources rest with water supply agencies, not MTC or ABAG, and would be a component of their urban water management plans, which are updated every five years. Nothing in the proposed Plan compels water supply agencies to increase groundwater pumping and the mitigation measures listed in Chapter 2.12 would mitigate impacts to less than significant levels if implemented. Consistent with the comment, the EIR notes that this is a potentially significant impact and so lists mitigation for it. And, because MTC and ABAG cannot compel local jurisdiction to adopt the mitigation measures listed, the impact remains significant and unavoidable.
- C22-25: The conclusion of the water supply analysis is presented along with other findings in the Executive Summary to convey clearly a complete analysis of the environmental consequences of the proposed Plan. Cumulative effects are specifically addressed in Chapter 3.2, CEQA-Required Conclusions, and in each chapter combined (e.g. “concurrent”) effects are described.
- C22-26: The comment states that special-status plants may occasionally occur in urban, agricultural and ruderal environments and that they and their reproductive parts should be surveyed for and collected prior to development in such areas. The comment further states in Comment C22-29 that non-adult stages of special-status wildlife should also be surveyed. While the Draft EIR makes the statement that special-status plants are not expected to occur in urban, agricultural and ruderal environments, their presence is not ruled out, even in such areas. Section 2 of this Final EIR includes a text change to clarify p. 2.9-15 of the Draft EIR.
- Mitigation Measure 2.9(a) requires a biological assessment and specific biological surveys (as required based on the general assessment) to be conducted as part of the environmental review process to determine the presence and extent of sensitive habitats and/or species in a specific project area. As stated on p. 2.9-59 of the Draft EIR, “...surveys are to be conducted by qualified professionals pursuant to adopted protocols and agency guidelines and be undertaken at times when the subject species is most likely to be identified.” For example, for plants, surveys are to be conducted when the species is identifiable, and for most plants this requires surveys to be conducted when the species in question are flowering or sometimes, fruiting. As another example, protocol surveys for red-legged frog include timing surveys during the breeding season, looking for all life-stages of red-legged frog. To include the survey protocols for each species considered is unnecessary in the context of a program EIR. See also the Master Response A.3 regarding the nature of a program EIR and the level of analysis required in such a document.
- C22-27: The comment states that the Draft EIR cannot accurately determine the environmental impact of the proposed Plan as the projects have not been defined, and therefore suggests the Draft EIR should not claim less-than-significant or significant but mitigable findings. As

discussed throughout the biological resources impact analysis, most, if not all, of the individual projects that could be implemented under the proposed Plan could have a significant and adverse effect on biological resources. Mitigation measures outlined in the impact analysis of the Draft EIR present standard protocol and regulatory requirements for reducing impacts to biological resources, which would reduce some impacts to a less-than-significant level to the extent that an individual project adopts and implements all feasible mitigation measures. However, as repeated throughout the impact analysis, MTC and ABAG cannot require local implementing agencies to adopt mitigation measures, and it would ultimately be the responsibility of a lead agency to determine and adopt mitigation. Therefore, the Draft EIR found multiple significant and unavoidable (SU) related to biological resources. . See Master Responses A.1 regarding local land use control and A.3 regarding the level of specificity in the EIR.

- C22-28: The comment is concerned about the statement on p. 2.9-55 of the Draft EIR that states that because most Plan Bay Area development will occur in existing transportation corridors and previously developed areas, overall habitat loss and fragmentation will be lower than if it were to occur in undeveloped areas; the comment appears to be saying that habitat loss and fragmentation may still take place in developed areas. While the comment is correct that habitat loss and fragmentation could take place in developed areas, it is also true that, in general, habitat in developed areas is already degraded through a number of mechanisms, including fragmentation and isolation. The intention of the statement is to point out that if all new development and transportation improvements were to occur in previously undeveloped lands the related impacts on biological resources would be much greater than under a plan that concentrates new growth in already developed areas, not to imply that these impacts would not occur at all in previously developed areas.
- C22-29: The comment is specifically concerned that regulatory requirements would not completely protect sensitive habitat areas or of the species. Please refer to response C22-26, which addresses similar concerns regarding appropriately timed surveys. Further, as noted frequently throughout the impact analysis, project- and site-specific considerations and regulatory requirements would be implemented as feasible on project-by-project bases. This approach allows site-specific consideration related to all biological resources and does not specifically limit mitigation to regulatory requirements.
- C22-30: Please refer to response C22-26 with regard to site-specific biological assessments and surveys, which will be required by each implementing agency and are intended to identify, avoid, and minimize impacts to sensitive resources on a site- or project-specific basis. Furthermore, as stated on p. 1.1-2 of the Draft EIR, the Draft EIR's programmatic, regional approach to the analysis of potential impacts "does not relieve local jurisdictions of the responsibility for evaluating project-specific, locally significant impacts. All impacts of individual projects will be evaluated in future environmental review, as relevant, by the appropriate implementing agency as required under CEQA and/or NEPA prior to each project being considered for approval, as applicable." CEQA streamlining is enabled by SB 375. Only certain projects are eligible for streamlining, as shown Table 1.1-1 of the Draft EIR. Furthermore, project wishing to undergo streamlining must implement all of the applicable mitigation measures listed in this EIR; see Master Response A.2 on CEQA streamlining for further information.
- C22-31: The comment about Table 2.12-4 is correct. It would, though, be speculative for the EIR to comment on future water rate hikes given the choices listed that the water agencies facing

shortfalls are considering (importing supplies and conserving water through conservation, reuse and recycling). Some of these options can reduce water use and, therefore, the cost of water borne by a consumer. Furthermore, the projected population increase in the region, which is the main source of regional-scale water shortages, will occur with or without the proposed Plan as explained in Chapter 3.1 of the Draft EIR.

- C22-32: The EIR does say, under Impact 2.12-6, that solid waste generated by both land use and transportation projects may reduce the capacity of existing landfills, a potentially significant effect. Active Bay Area landfills that were analyzed are listed in Table 2.12-6; this table does include a column showing remaining capacity, in both absolute terms (cubic yards of space) and as a percentage of total capacity. Estimated closure dates for each landfill also are shown. As this is a programmatic EIR for the nine-county region, generation and disposal was not analyzed on a county-basis. Instead, remaining life of the individual landfill sites was documented and assessed, leading to the conclusion that new landfill capacity is needed. Mitigation measures are listed but, as noted above, MTC and ABAG are limited in their ability to enforce them. The impact, therefore, remains significant and unavoidable.
- C22-33: Specific base and horizon years for the SB 375 analysis are set by statute; the 2040 horizon was added because that is the planning period for Plan Bay Area. See Master Response D.1 for additional information on greenhouse gas emissions included in the analysis for the SB 375 target.
- C22-34: The explanation for the conclusion cited on pg. 3.1-60 is that there are statutory mechanisms in place that reduce greenhouse gas (GHG) emissions. These are referred to by shorthand terms “Pavley” reductions and “LCFS”, the Low Carbon Fuel Standard. The Pavley GHG reduction program was created by Assembly Bill 1493, passed in 2002. The Low Carbon Fuel Standard was set under Executive Order S-01-07 in June, 2007. Additional information on these two programs is presented on pages 2.5-24 and 2.5-25. See also Master Response D.1 regarding SB 375’s GHG reduction targets. The methodology used for the impact analysis is described in the section starting on pg. 2.5-42. In sum, MTC and ABAG did the following:
- First, data was developed for on-road transportation emissions. The effects of Climate initiatives in the proposed Plan were then incorporated (see Table 2.5-5), using data derived for Criterion 1 in the GHG analysis, along with the Pavley reductions and the reductions under the Low Carbon Fuel Standard to arrive at a final total for transportation emissions.
 - Land use emissions were based on estimated energy consumption per land use type (e.g. single-family residential, multi-family residential, and commercial). ABAG provided information on households by housing type, and estimates of commercial space were derived from ABAG’s projections with square footage estimated based on an average square feet per job type, per UrbanSim outputs. Energy emissions were then calculated using standard coefficients that estimate CH₄, NO_x and CO₂ per kWh and then converted to MTCO₂e.
 - In addition, landfill emissions were calculated based on tonnage increasing at the same rate as population growth, with emissions estimated by EPA’s WARM model, assuming mixed waste.

- Land use emissions were then reduced using the measures recommended by the California Air Resources Board (ARB) in their Scoping Plan. Only measures specific to the land use analysis were considered. The Draft EIR assumes 19 percent of possible reductions for the State, removing policies that may overlap with each other, as the Bay Area has roughly 19 percent of the State's population. This is the same methodology used by SACOG in their SCS EIR analysis. It applies the reductions to "business as usual" use rates, which is appropriate because it is reasonable to expect land use energy efficiencies over the next 30 years (as opposed to efficiencies related to land use planning that are treated separately, as per SB 375). In no case are reductions made that exceed what is expected to occur, on a proportional basis, under ARB's Scoping Plan.
- Land use emissions were then added to transportation emissions (with reductions).
- For Criterion 2, the data in the Draft EIR do show that without the California Air Resources Board's Scoping Plan reductions and application of Pavley reductions and the Low Carbon Fuel Standard, there would be an overall increase in total emissions as a result of more population, jobs, and travel. However, with the reductions, which are mandated by law, there is a net reduction; hence, the determination presented in the EIR of a less-than-significant impact for the proposed Plan and the alternatives.

Letter C23 Kaia Eakin (5/2/2013)

C23-1: Commenters support for the proposed Plan is acknowledged.

Letter C24 Kaia Eakin (5/2/2013)

C24-1: Same letter as C23.

Letter C25 Carl Fricke (5/3/2013)

C25-1: The proposed Plan is regional land use strategy that is built around a Priority Development Area framework, with the vast majority of growth anticipated in the region going to areas identified by local jurisdictions as PDAs. See Master Response I regarding the PDA process. As individual development projects are implemented, the various infrastructure services mentioned in the comment will be evaluated and addressed at the project level. This Draft EIR is a program EIR and therefore does not include project-level analysis. See Master Response A.1 regarding local land use control and Master Response A.3 regarding the level of specificity of the EIR. See also response C25-3 regarding project-level analysis.

C25-2: The Draft EIR provides a regional-scale evaluation of public services, including police, fire and schools, in the Draft EIR, Chapter 2.14, Public Services. The chapter analyzes the potential impacts and provides adequate mitigation measures to lessen these impacts. Local jurisdictions will continue to be responsible for ensuring that adequate funds are identified to support public services for new local development. See Master Response A.1 and response C41-3 regarding local control and implementation.

C25-3: Not all parcels within PDAs are buildable, due to issues such as those cited in the comment. Page 2.3-44 of the Draft EIR says, "While the PDAs are areas in which growth is focused, PDAs would not be developed in their entirety, and would include diverse land uses in addition to jobs and housing that could include preservation of agricultural land." This is again noted on pp. 2.3-46 and 2.3-53.

This EIR evaluates Plan Bay Area as a single, regional project and assesses its impacts at a regional level across all nine counties, which is consistent with CEQA provisions regarding program EIRs. As stated in Chapter 2.0 of the Draft EIR, “as a program-level EIR individual project impacts are not addressed in detail; the focus of this analysis is to address the impacts which, individually or in the aggregate, may be regionally significant.” The individual projects that may result from the proposed Plan must comply with CEQA. Where necessary, site specific issues such as slope, stream setbacks, and local hazard issues will be addressed by project-level environmental review and/or local permits and regulations. Projects, even those qualifying for CEQA streamlining, will generally need to obtain discretionary permits or other approvals from the lead agency and the local jurisdiction, in accordance with local codes and procedures, including any agreements related to zoning, design review, use permits, and other local code requirements (Draft EIR, p.1.1-13). The Draft EIR does assess stormwater runoff and erosion in Chapter 2.8 and proposes Mitigation Measure 2.8(a), which is tied to existing regulations and so the impact is found to be less than significant with mitigation. . See Master Response A.3 regarding the level of specificity in the EIR.

- C25-4: As discussed under Impact 2.12-1, the Urban Water Management Plans (UWMPs) for the major water suppliers of the region indicate adequate water supplies for the amount of the region’s projected growth, at a regional level. This amount of population growth and development projected for the region will occur regardless of the proposed Plan and would be the actual cause of any impacts from expansions of water supply - these impacts will occur with or without Plan Bay Area, as shown in Chapter 3.1 of the Draft EIR. In the case of a localized water shortage caused by the distribution of growth under the proposed Plan, mitigation measures 2.12(a) through (h) should reduce the impact to less than significant, if applied by the implementing agency. Also see Master Response G regarding water supply. Cost impacts are not an environmental issue under CEQA and are beyond the scope of this EIR.
- C25-5: Any land development under the proposed Plan must comply with the Marin County General Plan and other local land use plans and ordinances, including zoning. Local jurisdictions may choose to update these regulations or enact a specific plan to promote the development pattern blueprint in Plan Bay Area. No local jurisdiction is required to enact Plan Bay Area. See Master Response A.1 regarding local land use authority. Local jurisdictions must comply with applicable state law and local rules regarding public noticing and review for rezoning for future projects and plans; any new land use plans or projects must comply with CEQA, including all applicable public noticing and comment requirements.
- C25-6: The proposed Plan does not contain any exemptions regarding land use development, nor can it override local land use authority; see Master Response A.1 regarding local land use authority. Local or State law may provide certain exemptions but these do not stem from the proposed Plan. SB 375 does provide for CEQA streamlining for certain eligible projects; see Master Response A.2 and Table 1.1-1 of the Draft EIR for an overview of requirements and benefits.
- C25-7: This comment does not raise an environmental concern that requires a response under CEQA.
- C25-8: See Master Response C regarding the request to extend the public comment period.

Letter C26 Robert Silvestri (5/9/2013)

C26-1: The comment claims that the Draft EIR fails to adequately establish reasonably proof of the efficacy of the proposed Plan or the Alternatives in reducing per capita or overall greenhouse gas (GHG) emissions. The Draft EIR analysis of GHG emissions uses EMFAC2011, which is developed through an extensive process by the California Air Resources Board (CARB) and approved by the United States Environmental Protection Agency. EMFAC2011 is the GHG emissions modeling tool MTC and ABAG are required to use for analysis of emissions. The travel model analysis was conducting using MTC's regional travel model, (*Summary of Predicted Traveler Responses*), which includes references to other, even more detailed, documentation. See Master Response D.1 regarding SB 375's GHG reduction requirements.

Moreover, the fact that commenter disagrees with some of an EIR's methodologies and conclusions is not a basis for overturning an EIR that is supported by substantial evidence - such as the proposed Plan's Draft EIR. Pursuant to CEQA, "substantial evidence" includes "fact, a reasonable assumption predicated upon fact, or expert opinion supported by fact." (Pub. Resources Code, § 21080, subd. (e)(1); CEQA Guidelines, § 15834, subd. (b).) Substantial evidence is not conjecture, nor is it speculation or unsubstantiated opinion or narrative. (CEQA Guidelines § 15384(a).)

"Challenges to the scope of the analysis, the methodology for studying an impact, and the reliability or accuracy of the data present factual issues, so such challenges must be rejected if substantial evidence supports the agency's decision as to those matters and the EIR is not clearly inadequate or unsupported." (*Federation of Hillside & Canyon Assns. v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1252 (*Federation*).) Here, substantial evidence supports the conclusions in the Draft EIR. Where substantial evidence supports the agency's findings, the agency's actions must be upheld. (*N. Coast Rivers Alliance v. Marin Mun. Water Dist. Bd. of Dirs.* (2013) 216 Cal.App.4th 614, 626; see also *El Morro Community Assn. v. Cal. Dept. of Parks and Recreation* (2004) 122 Cal.App.4th 1341, 1349 [court must uphold the EIR "if there is any substantial evidence in the record to support the agency's decision that the EIR is adequate and complies with CEQA"].)

C26-2: The comment claims that the Draft EIR's "cite" of MTC's supplementary report entitled *Draft Summary of Predicted Traveler Responses* or EMFAC2011 is "inadequate." MTC and ABAG assume that the author of the comment does not intend to imply that the actual citation of the report is inadequate, but rather that the documents do not adequately support the Draft EIR's claim that the proposed Plan will reduce GHG emissions. The *Draft Summary of Predicted Traveler Responses* provides a brief overview of the MTC travel model and links to detailed documentation of both the MTC travel model and the EMFAC2011 software. MTC and ABAG believe these tools are appropriate and useful for estimating the expected reductions in GHG emissions from changes in land development patterns, transportation policies, and transportation infrastructure.

C26-3: The comment claims that MTC and ABAG used "raw data and simplistic analysis" rather than thorough "analytical methodologies" to draw conclusions about the performance of the Draft EIR alternatives. Though these are subjective assessments, MTC and ABAG believe the analytical methods used to support the Draft EIR far exceed the state of the practice in both complexity and rigor. See response C26-1 regarding the use of EMFAC2011. See also

Master Response D.1 regarding SB 375's GHG reduction requirements, which points out that CARB has preliminarily approved MTC and ABAG's methodology.

- C26-4: See Master Response D.2 regarding the connection between high-density housing near transit and reduced greenhouse gas emissions.
- C26-5: The Draft EIR's estimates of current and future traveler behavior rely on complex analytical methods, as briefly described in the *Draft Summary of Predicted Traveler Responses* and described in great detail elsewhere (as referenced in the *Draft Summary of Predicted Traveler Responses*). The comment makes oblique references to "largely discredited" theories, but does not mention or criticize or praise the actual methods MTC and ABAG used to estimate the likely behavior of travelers living in TODs or high density urban areas. As such, MTC and ABAG are left to conclude that the criticism is based on a misunderstanding of MTC and ABAG's analytical methods. See Master Responses D.1 and D.2..
- C26-6: See responses C26-1 through C26-5 above.
- C26-7: The GHG emissions modeling in EMFAC2011 includes specific Bay Area inputs in terms of VMT from MTC's travel model, and the model also factors into region-specific climatic conditions.
- C26-8: As explained in responses C26-1 and C26-7, GHG emissions were determined using the EMFAC2011 model using VMT inputs as calculated by MTC's travel model. It is unclear how this would constitute "cherry picking." Every SCS in California is required to use EMFAC2011 to model emissions, as required by ARB and the federal government.
- C26-9: Absent identification of the "data used in the Draft EIR" or the "more recent research" to which this subject concerns, MTC and ABAG cannot meaningfully respond to the comment. MTC and ABAG, however, stand by the accuracy of the data used in the EIR which was developed by staff and consultants with expertise in fields relevant to each topic analyzed in the Draft EIR.
- C26-10: See response C26-12 below.
- C26-11: The comment claims Figure 2.5-2 in the Draft EIR is biased and irrelevant to the purposes of the Draft EIR. MTC and ABAG disagree. Furthermore, the figure is included in the settings portion of Chapter 2.5 to provide general information and context for the analysis that follows, including primarily the composition of emissions, as discussed in the text on page 2.5-6 of the Draft EIR. The figure was developed by the Bay Area Air Quality Management District for the 2010 Source Inventory. While short-term fluctuations would be expected, there is no evidence presented to indicate that the long term trends themselves or the composition of emissions shown in this figure are biased.
- C26-12: The comment implies that the analysis performed in the Draft EIR ignored evidence of declining GHG emissions that coincided with the declining economic output of the country following the 2008 recession. This is inaccurate. As demonstrated in Table 13 (pp. 64) of the *Summary of Predicted Traveler Responses* supplementary report, MTC and ABAG estimate a reduction in Carbon dioxide emissions from 2005 to 2010.

- C26-13: The comment notes that the SB 375 analysis only considers per capita emissions from automobiles and light duty trucks, not the entire transportation sector. This is correct. See Master Response D.1 for additional detail.
- C26-14: The comment questions including both Figure 2.5-2, which shows an increase over time of GHG emissions, and Figure 2.5-7, which shows a decrease. As noted in response C26-11, Figure 2.5-2 was included to provide general information and context for the analysis that follows, including primarily the composition of emissions, as discussed in the text on page 2.5-6 of the Draft EIR. Figure 2.5-7 shows the trends in emissions *per capita* for passenger vehicles and light duty truck only based on the analysis done for the Draft EIR.
- C26-15: The comment is an extension of comment C26-14 above. The comment includes a chart published by the EPA over total U.S. Greenhouse Gas Emissions, 1990-2011. This chart includes all sectors, and covers a different time period than Figure 2.5-2, including a significant recession. The figures and charts provide different analyses.
- C26-16: The comment states that potential increases in zero emissions vehicles, combined with other environmental laws and GHG reduction technologies will help reduce GHG emission from autos and light duty trucks even more dramatically than shown in Figure 2.5-7 in the Draft EIR. The GHG analysis, as required by the federal government, uses EMFAC2011 to evaluate GHG emissions. EMFAC2011 includes ARB-developed forecasts regarding fleet turnover and vehicle mix, including adoption of zero emissions vehicles. In the analysis for Impact 2.5-1, MTC and ABAG do assume a higher rate of electric vehicle adoption due to the Climate Program Initiative programs focused on electric vehicle purchase incentives and expansion of a regional electric vehicle charger network.
- The analysis for Impact 2.5-1 is based on the SB 375-required GHG emissions reduction targets, for which MPOs are not allowed to take credit for advances in technologies or reductions due to regulations. Were those other benefits included, Figure 2.5-7 would indeed show greater reductions. See Master Response D.1 for more information.
- C26-17: MTC employed the ARB EMFAC2011 vehicle emission model to generate all on-road mobile source emission inventories included in the Draft EIR. EMFAC2011 represents ARB's next step in the ongoing improvement of the EMFAC series of emissions estimation models and is the best available tool to calculate on-road mobile source emissions. The EMFAC2011 is needed to support the ARB's regulatory and air quality planning efforts and to meet the Federal Highway Administration's transportation planning requirements. EMFAC2011 includes the latest data on California's car and truck fleets and travel activity. This data includes fleet mix (vehicle type, model year, and accumulated mileage), miles traveled, vehicle speeds, and vehicle emission factors. The model also reflects the emissions benefits of ARB's recent rulemakings including on-road diesel fleet rules.
- As noted in the Draft EIR (pages 2.2-18 and 2.2-19), EMFAC2011 does not include ARB's Advanced Clean Car Standards approved in 2012. Because of this, as noted on the pages referenced above in the Draft EIR, it is anticipated that overall emissions in the future will be lower than those calculated by this current version of the EMFAC model. However, as explained in Master Response D.1, the emission reductions due to new CAFE standards and the Advanced Clear Car Standards cannot be included in the MPO's per capita GHG emissions analysis for reaching the SB 375 GHG emissions reduction targets.

- C26-18: See Master Response D.1 regarding GHG emissions for SB 375.
- C26-19: The comment claims the Draft EIR did not adequately examine all available information and statistics to justify its projections. The analysis in the Draft EIR utilizes the most recent and federally-mandated GHG emissions reduction model, EMFAC2011. As noted in response C26-17, EMFAC2011 does not account for new CAFE standards or the CARB Advanced Clean Car Standards. However, the SB 375-required GHG emissions reductions are not allowed to include the benefits of new CAFE standards. See Master Response D.1 for more information regarding GHG emissions for SB 375.
- C26-20: SB 375 requires regional planning agencies to include a Sustainable Communities Strategy (SCS) in their regional transportation plan (RTP) that demonstrates how the region could achieve GHG emissions reductions set by CARB through integrated land use and transportation planning *without* GHG emission reduction benefits produced from vehicle and fuel technology improvements. Please refer to table 2.5-7: Total and Per Capita Passenger Vehicle and Light Duty Truck CO₂ Emissions (CO₂ Emissions Per Capita column), figure 2.5-7: Per Capita Emissions, Car and Light Duty Truck Emissions and Figure 3.1-1: Change in Per Capita Car and Light Duty Truck CO₂ Emissions, by Alternative for EIR documentation. See Master Response D.1 for more information regarding GHG emissions for SB 375.
- C26-21: See responses C26-1 and C26-20.
- C26-22: See response C26-1.
- C26-23: The EIR may properly assume that people and jurisdictions follow mandatory federal, State, and local laws and regulations. Also see response C26-1.
- C26-24: The comment claims that analysis of actual auto and light truck use in Marin County shows that the proposals in the proposed Plan will not result in any reduction in GHG emissions from autos and light truck usage, and will instead increase GHG emissions. The analysis in the Draft EIR shows that there will be an increase in total GHG emissions from autos and light duty trucks between 2010 and 2040 when the benefits of Pavley and LCFS are not included, as documented in Table 2.5-7 in the Draft EIR. The reduction in GHG emissions that are documented in the Draft EIR related to GHG emissions from passenger vehicles and light duty trucks *per capita* (Criterion 2.5-1), and overall GHG emissions from land use and transportation (Criterion 2.5-2).
- C26-25: There are no charts on the pages referenced in the comment. Figures 2.5-5 and 2.5-6, which are also referenced in the comment, address sea level rise and climate change and do not appear to correspond in any way to the comment.
- C26-26: MTC and ABAG are unable to locate this quote in the Draft EIR. Regardless of the validity of this statement, Plan Bay Area is required to attain the GHG emissions reductions targets established by SB 375 regarding per capita emissions from cars and light trucks.
- The Bay Area Air Quality Management District's (BAAQMD) "Source Inventory of Bay Area Greenhouse Gas Emissions" document defines the transportation sector's greenhouse gas emissions in the Bay Area as on-road motor vehicles, locomotives, ships and boats, and aircraft. BAAQMD's GHG emission inventory document also forecasts 2020 transportation

sector GHG emissions at 35 percent of the region's total GHG emissions and the on-road mobile source category (only) represents 31 percent of the region's total GHG emissions.

- C26-27: Plan Bay Area attains the GHG emissions reductions targets required by SB 375 regarding per capita emissions from cars and light trucks.
- C26-28: Regardless of the validity of this statement, Plan Bay Area is required to attain the GHG emissions reductions targets established by SB 375 regarding per capita emissions from cars and light trucks. The Bay Area Air Quality Management District's (BAAQMD) "Source Inventory of Bay Area Greenhouse Gas Emissions" 2007 GHG emission inventory shows (in Figure 2: 2007 Bay Area GHG Emissions by Sector) both the Transportation sector and the Industrial/Commercial sector at 36.4 percent of the regional total.
- C26-29: The comment questions what the correct metrics and data points should be used to arrive at accurate projection for the purposes of the Draft EIR. Comments C26-26 through C26-28 focused on purported introductory text used to set the context of Chapter 2.5. The data used for the EIR emissions analysis is the data from the MTC Travel Model and EMFAC2011.
- C26-30: The comment states that there is nothing in the Plan that has any possibility to significantly reduce emissions in Marin County. The GHG analysis is a regional analysis and the Draft EIR does not include county-specific emissions analysis. It is theoretically possible, albeit unlikely, that the proposed Plan may result in increased per capita car and light truck GHG emissions in some locations. Regardless, as long as the Plan attains the CARB targets for GHG emissions reductions across the nine-county Bay Area region it conforms with SB 375.
- C26-31: The comment states that the analysis does not factor in GHG producing outcomes of more growth and development due to MTCO₂ sequestration loss. The Draft EIR does include land use GHG analysis in Criterion 2.5-2. This analysis includes GHG emissions for various types of development. Regarding sequestration, see response C26-32.5.
- C26-32: The analysis for Criterion 2.5-2 used household emissions based on average use for climate zone four per the BAAQMD BGM User's Manual, a more regionally specific input than EPA's national estimate: "BGM [BAAQMD's greenhouse gas model] estimates average residential electricity and natural gas use based on the California Residential Appliance Saturation Study. The results of this study were used to estimate energy use for the average single family and multi-family residence." (p. 25).
- C26-32.5: Table 2.3-18 in the Draft EIR estimates a potential loss of 1,352 acres of forest and timberland in the region under the proposed Plan. A 2007 report by the USDA Forest Service found that on average California forests store 40 tons per acre, and redwood forests support the greatest concentration of Carbon storage among California forest types at 150 tons per acre.³ Even making the conservative assumptions that all 1,352 acres of forest and timberland are developed and entirely consist of redwood forest, that would increase annual GHG emissions by 202,800 tons. In addition, Table 2.3-13 shows that the proposed Plan

³ Christensen, G.A., S. Campbell, J. Fried (Tech. Coords.). 2007. California's Forest Resources: Forest Inventory and Analysis, 2001-2005. USDA Forest Service, Pacific Northwest Research Station, Forest Inventory and Analysis Unit (PNW-FIA), Portland, OR. March 22, 2007 version. Cited in Mader, Steve, 2007. *Climate Project: Carbon Sequestration and Storage by California Forests and Forest Products*.

would potentially convert 1,742 acres of open space; using the 1.5 tons per year figure from the comment, that would increase GHG emissions by another 2,613 tons. Combined, conversion of forestland and open space would reduce sequestration and increase GHG emissions by 205,413 tons per year. However, when compared to the total regional annual GHG emissions shown in Table 2.5-10, which show 7,503,000 tons of CO₂e reduction in 2040, accounting for lessened sequestration would only lower this number to around 7,297,587, or a 2.7 percent decrease, and the proposed Plan would still easily have no adverse impact under Criterion 2.5-2.

Note that Tables 2.3-12 and 2.3-18 together estimate the loss of 135 open space acres and 255 forestland acres in Marin County, respectively. The land development pattern in the proposed Plan includes a significant amount of urban infill and redevelopment, which generally would not affect sequestration.

C26-33: See response C26-32.5.

C26-34: The comment claims that high density TOD would increase GHG emissions in Marin County. The Draft EIR emissions analysis is a regional analysis. See Master Response D.2 regarding the connection between high-density housing near transit and reduced GHG emissions and Master Response A.3 regarding the level of specificity in the EIR.

C26-35: The comment claims the analysis is false and that GHG emissions will be far less than indicated. This comment appears to contradict those made earlier in the comment letter claiming that the GHG analysis vastly understates GHG emissions. See response C26-1.

C26-36: Reducing automobile travel can be accomplished by shifting travelers to public transportation, as noted in the comment letter, but can also be accomplished by reducing the length of travel (a subject not mentioned in the comment letter). Meaning, increasing available housing – including affordable housing – and employment opportunities has the potential to reduce the length of trips made in automobiles and, as follows, the amount of Carbon dioxide generated from automobiles. For example, the Census (American Community Survey 2011 data summaries B08007 and B08604) estimates that approximately 46,000 commuters travel to Marin to work each day. If these workers were able to live in Marin, less automobile travel would likely be required for them to travel to work – even if they continued to travel by automobile. A reduction in automobile trip length, as highlighted in Figures 14 and 15 of the *Summary of Predicted Traveler Responses* document, is a key outcome of Plan Bay Area.

C26-37: MTC and ABAG followed the same procedures in analyzing Criterion 2.5-1 for all alternatives as used for the proposed Plan, shown in Chapter 3.1 Per responses C26-1 through 36, MTC and ABAG followed CARB requirements and used the appropriate inputs.

C26-38: See responses C26-32.5 through 37.

C26-39: Please refer to Master Response D.2 on the relationship between high density housing near transit and greenhouse gas emissions.

C26-40: As the comment cites no evidence of bias or provides examples of studies that reach different conclusions than those referred to in the Draft EIR, MTC and ABAG cannot meaningfully comment.

- C26-41: See responses C26-39 and 40.
- C26-42: See responses C26-43 through 53.
- C26-43: Criterion 2.5-2 does not involve per capita GHG emissions, rather total net emissions, so this comment does not apply.
- C26-44: See response C26-43.
- C26-45: It is unknown to MTC and ABAG if the factors used by BAAQMD (see response B26-32) include energy consumption from common areas. However, assuming that including common areas would increase emissions from multi-family units by 20 percent, recalculating the 2010 and 2040 GHG emissions from multi-family residential in Table 2.5-8 of the Draft EIR would only increase 2040 emissions from the proposed Plan by 252,600 MTCO₂e compared to existing conditions. This would not change the conclusion that the proposed Plan would have no adverse impact under Criterion 2.5-2.
- C26-46: Calculating the heat island effect would be speculative since it is not possible for MTC and ABAG to know how much vegetation, type of roofing, etc. that future land development would include in its design. This factor is better assessed in project-level environmental review; see Master Response A.3 regarding the level of specificity of a program EIR.
- C26-47: Including all such “externalities” of urbanism would be speculative as it would need to make assumptions about everything from food diets to agricultural trends.. Similarly the length and efficiency of electrical transmission varies greatly and is beyond the scope of this EIR to research and calculate at a regional scale. Unlike the graph in the comment, this EIR uses data based on American rather than foreign consumption habits.
- C26-48: See response C26-32.5 regarding the relatively small impact of including sequestration in the analysis. Tables 3.1-25 and 26 of the Draft EIR show the amount of open space and forestland each alternative could potentially convert. Applying the same calculations as in response C26-32.5, the No Project alternative would result in the greatest lessening of sequestration (almost 390,000 tons), but when taking that into account with the comparative annual GHG emissions shown in Table 3.1-29, would still easily meet Criterion 2.5-2.
- C26-49: See Master Response D.2. The proposed Plan would also reduce the average distance between employment, services, and housing, which results in less VMT due to shorter trips.
- C26-50: See responses C26-32.5 and C26-48.
- C26-51: See responses C26-32.5 through 49.
- C26-52: The commenter’s admittedly “overly simplistic analysis” (see comment letter page 28) relies on the assumption that vehicles owned by Marin County residents travel, on average, the same distance in an average year as vehicles owned by San Francisco County residents (see comment letter page 27). It also assumes that the “rural and suburban, low density development” in Marin County could exist independently of the “high density urban development” in San Francisco County, i.e. that it is possible to have suburban housing development in the absence of urban job centers. No evidence is provided or referenced to support either of these highly dubious claims, making the conclusions reached thereafter

speculative. SB 375 directs MTC and ABAG to reduce emissions from automobiles and light-duty trucks. See also Master Response D.2 regarding the connection between high-density housing near transit and reduced GHG emissions.

C26-53: See response C26-1.

C26-54: See response C26-1 and Master Response D.2.

C26-55: The comment claims that the Plan and alternatives will be economically destabilizing, are financially irresponsible and will be environmentally harmful. The Draft EIR identifies 39 significant environmental impacts, disclosing multiple potential environmental impacts. However, the proposed Plan consistently has less of an environmental impact than the No Project, which is the alternative if no Plan were adopted. The EIR is an informational document that discloses potential impacts so the public and decision-makers can make informed decisions.

C26-56: The comment claims that the Draft EIR fails to prove that any of the alternatives will reduce per capita of overall GHG from the use of autos and light trucks. The Draft EIR demonstrates in the analysis for Criterion 2.5-1 that the proposed Plan will reduce the GHG emissions from passenger vehicles and light duty trucks on a per capita basis; it will also result in an overall increase in GHG emissions from passenger vehicles and light duty trucks when excluding the GHG emission reductions anticipated from other regulatory and technological approaches (e.g. vehicle technology and fuel efficiency) to reducing GHG emissions.

C26-57: See response C26-1.

C26-58: See response C26-1.

C26-59: Throughout the comment letter, the relationship between “transit-oriented development (TOD)” and “high density urban development” and travel behavior is discussed. At no point, however, does the letter address or criticize or praise the methods MTC actually used in the Draft EIR to estimate travel-related outcomes, including the behavioral models MTC uses to estimate the likely actions of travelers living in TODs or high density urban areas. It is unclear how the conclusions in the letter were reached absent this type of investigation. Regarding the relationship between TOD and high density development and travel behavior, MTC and ABAG provide a detailed summary report (*Summary of Predicted Traveler Responses*), which includes references to other, even more detailed, documentation.

C26-60: See response C26-1.

C26-61: See response C26-1.

Letter C27 Wouter Dito (5/4/2013)

C27-1: The types of impacts suggested by the commenter constitute project-specific concerns more appropriately assessed at the local level when specific projects are considered in the future by implementing agencies; see Master Response A.3 regarding the level of analysis for this regional EIR. The comment questions if the analysis considers the impacts of bus-only lanes. The travel model does evaluate bus rapid transit project, including if a project includes bus

only lanes. However, the impacts cited in the comment are better addressed at the project-level, as the regional model is not designed to evaluate local impacts of a bus only lane.

Letter C28 Sabine Grandke-Taft (5/5/2013)

- C28-1: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR. Please see Master Response C regarding requests for extensions of the public comment period.
- C28-2: Commenter's general concern regarding the data used to develop the proposed Plan is noted. The decision-makers will consider this comment prior to adopting the proposed Plan or one of the other alternatives included in the EIR.
- C28-3: Chapter 2.8 (Water Resources) of the EIR and Chapter 2.12 (Public Utilities and Facilities) evaluate potential water and sewer related impacts of the proposed Plan respectively. Chapter 2.14 (Public Services and Recreation) of the Draft EIR evaluates discusses potential impacts to public services including schools.
- C28-4: Implementing agencies retain the discretion to approve or deny future residential development proposals within their jurisdiction. See Master Response A.1 regarding local land use control.
- C28-5: Commenter's suggestions regarding social equity issues is noted. The decision-makers will consider this comment prior to adopting the proposed Plan or one of the other alternatives included in the Draft EIR. See also Master Response F regarding displacement.

Letter C29 Rebecca Lapedus (4/29/2013)

This is the same as Letter C17; see the responses to C17.

Letter C30 John Spangler (5/3/2013)

- C30-1: Please see Master Response C regarding requests for extensions of the public comment period.

Letter C31 John Wallace (4/22/2013)

- C31-1: Commenter's opposition to the proposed Plan is acknowledged. See response C28-1 regarding the public noticing for this EIR. Plan Bay Area will not override local zoning and land use regulations; see Master Response A.1 for more information on local land use control.
- C31-2: Commenter's support for the No Project alternative is noted. Decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C32 Libby Lucas (5/3/2013)

- C32-1: Chapter 2.9 of the Draft EIR analyzes wetlands impacts at a regional level and additional information is included in Appendix H. See also Master Response A.3 regarding the programmatic nature of this EIR. Avoidance of wetlands is the preferred mitigation identified in the EIR (see Mitigation Measure 2.9(d)). Implementing agencies will conduct project-specific biological resource assessments, where necessary, to comply with CEQA. Implementing agencies retain the ability to exercise their discretion to deny projects that cannot avoid wetland impacts. See Master Response A.1 regarding local land use control.
- C32-2: Climate change and sea level rise are analyzed in Chapter 2.5 in the Draft EIR. Future improvements to existing transportation infrastructure must comply with CEQA. Where necessary, potential sea level rise impacts will be evaluated as part of future project-specific environmental assessments.

Letter C33 Sharon Rushton (5/8/2013)

- C33-1: The comment states that the Draft EIR fails as an informational document because it defers analysis and fails to disclose significant impacts and does not provide sufficient mitigations. The Draft EIR is a programmatic EIR and includes extensive analysis of the potential environmental impacts of proposed Plan, finding 39 significant impacts. As described in Master Response A.3, future projects will comply with CEQA at the project-level.
- C33-2: For an overview of the Regional Housing Needs Allocation, DOF Population Projections and ABAG's Plan Bay Area Forecast please see Master Response B.1 and the following document here:
http://apps.mtc.ca.gov/meeting_packet_documents/agenda_2038/06_Overview_of_RHN_D_DOF_Projections_and_Plan_Bay_Area.pdf

The document was prepared jointly by the California Housing and Community Development Department (HCD), the California Department of Finance (DOF), and the Association of Bay Area Governments (ABAG). It provides key points regarding the differences across the Regional Housing Need Determination (RHND), the DOF Population Projections, and the Plan Bay Area Forecast as described by each of the responsible agencies. It also contains a chart that summarizes how the three efforts vary in purpose, methodology and timing.

ABAG's regional growth forecast starts with projected regional job growth which is the main determinant of ABAG's regional growth projections and includes population growth as in all major regional forecast modeling in California and around the nation including regional projections produced by SCAG, SANDAG, SACOG, AMBAG, and SBCAG. In addition, job growth is the primary determinant of regional population growth in the models used by the three major national forecasting firms – IHS Global Insight, Regional Economic Models, Inc., and Moody's. ABAG estimated job growth through 2040 as a share of U.S. projected job growth, also known as “shift-share” which is a widely used and accepted employment forecasting methodology, based on an assessment of regional competitiveness by major industry sectors. ABAG projections use Department of Finance (DOF) fertility and mortality assumptions to determine the amount of natural increase in the population to develop a population profile. Migration, rather than being tied to recent trends, is a function of job growth. Moreover, DOF has acknowledged that the ABAG regional growth forecast

is reasonable and that they will incorporate portions of our methodology to improve their forecasts for the region in the future. The theory of deriving migration forecasts linked to job growth is that most migration is the result of people moving to regions where job growth exceeds the number of workers supplied by the local economy and vice versa. For the Bay Area, the best example is the large number of people who migrated to the region from other parts of the state, nation and world during the high-tech and dot.com boom of the late 1990s and the exodus out of the region in the years when job losses occurred after 2000 when the boom ended.

The proposed Plan, or distribution of growth to individual jurisdictions, is not a forecast. It is a blueprint for growth to achieve the goals and objectives of the Sustainable Communities Strategy (SCS) and was developed through a variety of land use and transportation scenarios that distributed the total amount of growth forecasted for the region to specific locations. The amount distributed to Marin County is about 8,800 households over 30 years or less than 300 new households annually for the entire County. These scenarios sought to address the needs and aspirations of each Bay Area jurisdiction, as identified in locally adopted general plans and zoning ordinances, while meeting Plan Bay Area performance targets adopted by the agencies to guide and gauge the region's future growth.

The framework for developing these scenarios consisted of the pre-existing Priority Development Areas (PDAs) and Priority Conservation Areas (PCAs) nominated by a local government, not ABAG or MTC. ABAG and MTC incorporated local feedback from individual jurisdictions relying on their best assessment of feasible growth over the plan period and then applied a series of additional factors to achieve the goals of the SCS. See Master Response I regarding the PDA process. The scenarios were then developed through a transparent, deliberative process, during which public input was sought at every step along the way. After further modeling, analysis and public engagement, the five initial scenarios were narrowed down to a single preferred land use scenario.

For more on how the Plan distributed projected regional growth, see:

http://onebayarea.org/pdf/Draft_Plan_Bay_Area/Draft_PBA_Forecast_of_Jobs_Population_and_Housing.pdf

C33-3: See response C33-2.

C33-4: Mitigation measures 2.1(a) and 2.1(c) are primarily directed towards the region's major congested freeways, rather than smaller roadways across the region. As the proposed Plan does not evaluate localized operational traffic impacts (instead focusing on regional impacts), the Draft EIR analysis neither supports nor contradicts the commenter's claim that State Route 1 near Mill Valley is a LOS F facility requiring mitigation. (Note that LOS F facilities are defined on page 2.1-33 as having a volume-to-capacity ratio greater than 1.) Local traffic operational issues as identified in this comment should instead be dealt with as part of local project analyses, rather than this program Draft EIR, as described in Master Response A.3. Further information on the programmatic nature of this environmental document can be found on page 1.1-4 of the Draft EIR

C33-5: Refer to response C33-4 regarding the regional scope of the Plan Bay Area Draft EIR – for the purposes of this regional programmatic EIR the localized operational issue cited by the commenter is not addressed. Roadways across the region, including major freeways, state highways, and major arterials, would benefit from a commuter benefit ordinance as specified

in mitigation measure 2.1(b), as that policy would reduce the need to drive by providing alternative transportation options and by encouraging telecommuting. This would not only benefit major freeways but also smaller roadways, as those roads provide necessary connections from residential neighborhoods to the regional freeway network.

C33-6: Refer to the responses C33-4 and C33-5 regarding the regional scope of this EIR. Mitigation measure 2.1(b) would mitigate Impact 2.1-3 by reducing the overall need to drive across the region, including on small highways and arterials.

C33-7: The Draft EIR did not identify any mitigation measures to lessen TAC and PM_{2.5} impacts for areas identified above the numerical thresholds for these pollutants in impact 2.2.5(a) or 2.2.5(b). Phasing of residential development or site design to locate sensitive land uses as far as possible from a source can be effective mitigation measures in reducing the public's exposure to these pollutants, but they were not relied on to reduce impacts below the level of significance for the 100/million or 0.8ug/m³ thresholds. The 1000-foot "zone of influence" is part of the methodology to evaluate potential cumulative impacts from a proposed project on the environment or upon a proposed project from the existing environment to determine if sensitive populations will be exposed to TAC and PM_{2.5} concentrations above the numerical significance thresholds. The 1000-foot zone of influence is not a significance threshold in and of itself.

Impact 2.2.5(b) identifies mitigation measures for projects locating within "set distances" of sources other than refineries, the Port of Oakland, dry cleaners and gas stations, that if implemented will reduce exposure to future sensitive receptors. If in any of these "set distances" TAC and PM_{2.5} concentrations were estimated to be above the 100/million or 0.8ug/m³ thresholds, the impact would still be considered significant. For these areas above the numerical thresholds for TAC and PM_{2.5} and the other sources listed above, additional project level analysis should be done when specific projects are designed and proposed to determine the significance of impacts and the level of mitigation measures needed to reduce impacts below the significance level, if available.

C33-8: The dispersion modeling used in the Draft EIR takes into consideration multiple sources of emissions for the TAC and PM_{2.5} local pollutant analysis. The Air District used its current stationary source database to identify all stationary sources, such as dry cleaners, gas stations and back-up generators, within the Bay Area, and combined these emissions with those from highways and major roadways to identify areas above the numerical significance thresholds for TACs and PM_{2.5}.

C33-9: The methodology for the dispersion modeling assumes an individual is exposed to the estimated emissions from the source(s) 24 hours per day, 7 days per week, and 365 days per year over a 70-year lifetime. Therefore, the concentrations estimated from the modeling and the exposure to an individual represent an absolute worst-case analysis when applied to the numerical significance thresholds to determine the significance of impacts. MTC and ABAG, in consultation with the BAAQMD, believe the mitigations included in the Draft EIR are appropriate. Local jurisdictions will determine if implementing agencies have adequately reduced impacts if they seek to tier off of this Draft EIR. See Master Responses A.1 on local land use control and A.2 on CEQA streamlining.

C33-10: See response B25-8 and 10 for more information on health effects of emissions.

C33-11: This comment compares the findings of the Plan Bay Area Draft EIR with the findings of the Draft EIR for the 2007 Marin Countywide Plan in regards to the potential impact related to groundshaking and claims that the impacts are not adequately analyzed, disclosed or mitigated. As noted in the Plan Bay Area Draft EIR on page 2.7-25, an earthquake that exceeds magnitude 6.7 is likely to occur in the Bay Area region over the next 30 years. An earthquake of this magnitude could cause damage to existing improvements especially to those constructed under less stringent building code requirements and those located on unengineered fills. However, the regulatory requirements that would apply to the proposed improvements would include, without limitation:

- California Building Code– Chapter 18 Soils and Foundations
- American Society of Civil Engineers (ASCE 7) – Chapter 11 Seismic Design Criteria
- Seismic Hazards Mapping Act of 1990 (SHMA 1990) (Public Resources Code, Chapter 7.8, Section 2690-2699.6)
- Special Publication 117A Guidelines for Evaluating and Mitigation Seismic Hazards in California (SP117A)
- California Code of Regulations, Title 14 Section 3724 (CCR Title 14 Section 3724)

These regulatory requirements present circumstances in which a geotechnical investigation is required and provide details on the seismic design criteria necessary for proposed improvements that incorporate site specific conditions, the purpose of which is to prevent the structure from significant damage resulting from seismic events. While some damage may be unavoidable, the protection of human safety is paramount to these code requirements and based on years of scientific study that incorporate events that have occurred across the world. Therefore, with incorporation of the requirements as stated in Mitigation Measure 2.7(b) of the Draft EIR, the potential impact for proposed improvements would be less than significant.

The Plan Bay Area Draft EIR identifies all of the seismic risks noted by the commenter: liquefaction (Physical Setting, p. 2.7-10; Impact 2.7-3, p. 2.7-26); subsidence and settlement (Physical Setting, p. 2.7-13; Impact 2.7-6, p. 2.7-32); seismically induced ground failure (Physical Setting, pp. 2.7-10, 2.7-18; Impact 2.7-3, p. 2.7-26). The Plan Bay Area Draft EIR also discusses fault rupture (Physical Setting, p. 2.7-6; Impact 2.7-1, p. 2.7-22); ground shaking (Physical Setting, p. 2.7-9; Impact 2.7-2, p. 2.7-24); and landslides (Physical Setting, p. 2.7-14; Impact 2.7-4, p. 2.7-28). In *Oakland Heritage Alliance v. City of Oakland* (2011) 195 Cal.App.4th 884, the court held that an agency properly conclude “that conformity with the current building standards ... in conjunction with ... other require[d] [future studies], adequately mitigated the seismic impacts of the project.” (*Id.* at p. 635.) Therefore, notwithstanding the more conservative interpretation taken by Marin County, based on identification of the same risks, the impact analysis in the Draft EIR reasonably concludes that geologic and seismic impacts can be reduced to a less-than-significant level with regulatory compliance and implementation of the identified mitigation.

C33-12: The comment compares the findings of the 2007 Marin Countywide Plan Draft EIR to the Plan Bay Draft EIR and claims that the impacts relating to liquefaction are not adequately analyzed, disclosed, or mitigated. As noted on page 2.7-10 of the Draft EIR, liquefaction hazards vary across the region and can only be determined with evaluation of site specific data from a geotechnical investigation as required by Mitigation Measure 2.7(b). Current

building code requirements including requirements within Special Publication 117A, A Guideline for Evaluating and Mitigation Seismic Hazards in California, contain effective measures for reducing the potential of liquefaction, based on years of scientific research, to minimize the potential for damage to a less than significant level. See also response C33-11.

- C33-13: The comment addresses settlement issues (e.g., cracking of pathways and walkways surrounding buildings, particularly related to Mill Valley's Tam Junction) that can become tripping hazards for pedestrians. As noted in the Draft EIR on page 2.7-32, site preparation measures such as compaction of engineered fill materials would be required to adhere to building code and local grading requirements that are designed to minimize the potential for unstable soils to adversely affect proposed improvements. While periodic maintenance of walkways and sidewalks may be necessary over time, the potential impact is not considered significant with incorporation of Mitigation Measure 2.7(b).
- C33-14: See master response E regarding sea level rise.
- C33-15: See master response E regarding sea level rise.
- C33-16: "The level of specificity of an EIR is determined by the nature of the project and the 'rule of reason'." (*Laurel Heights Improvement Ass'n v. Regents of University of California* (1988) 47 Cal.3d 376, 407.) "[W]here an EIR covers several possible projects that are diverse and geographically dispersed, the agency has discretion to evaluate the potential environmental impacts of the individual projects in general terms in the EIR, while deferring more detailed evaluation of the projects for future EIRs." (*California Oak Foundation v. Regents of University of California* (2010) 188 Cal.App.4th 227, 271, citing *In re Bay-Delta* (2008) 43 Cal.4th 1143, 1170-1171.) See also master response E regarding sea level rise.
- C33-17: See master response E regarding sea level rise.
- C33-18: See response C33-16. See also master response E regarding sea level rise.
- C33-19: The statement "CEQA Streamlining Projects Under SB 375 That Implement All Feasible Mitigation Measures: Less than Significant with Mitigation" was used in the executive summary to summarize a conclusion more fully described in Part Two of the EIR under the "Significance After Mitigation" section that accompanies the impact analysis and mitigation measures for each potential impact. See Master Responses A.1 on local land use control and A.2 on CEQA streamlining.
- C33-20: The decision-makers may find that the proposed Plan would create significant environmental impacts, but that these impacts are outweighed by other benefits of the proposed Plan. In addition many of the significant and unavoidable impacts occur because for land use projects MTC and ABAG cannot require local implementing agencies to adopt mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. Please see Master Response A.1 on local control over land use for additional information.
- C33-21: See responses C33-1 through 20 above.
- C33-22: The expected amount of growth will occur regardless of Plan Bay Area. The growth projections are not advocated for by MTC and ABAG but merely represent the best current

estimates; see Master Response B.1 for more information on the population projections. TPPs are defined under SB 375 and relate to locations in relation to transit service. PDA boundaries are developed and submitted by local jurisdictions to ABAG for consideration. See Master Response I regarding the PDA process. Hazards are evaluated in Chapter 2.13 of the Draft EIR, which proposes Mitigation Measures 2.13(a) through (g) to reduce potential impacts. Approval of development projects, and consideration of project-specific hazards, will be considered by implementing agencies as future projects are proposed. See Master Response A.1 regarding local land use control.

Letter C34 Elliott and Shayna Stein (5/2/2013)

C34-1: The Draft EIR thoroughly evaluates the regional impacts of sea level rise (Chapter 2.5), flood hazards (Chapter 2.8), and transportation (Chapter 2.1) under the proposed Plan, and sets forth mitigation measures, as appropriate, to address each of these issues. Master Response E contains additional information on the draft EIR's analysis of sea level rise. Please see Master Response A.3 regarding the specificity of a program EIR.

Letter C35 John and Kathleen Swart (5/4/2013)

C35-1: Your support for the No Project alternative is acknowledged.

Letter C36 Zelda Bronstein (5/15/2013)

C36-1: Industrial lands are taken into account in the land use pattern, as described in response C36-2 below. Moreover, ABAG and MTC are currently undertaking a three year initiative funded by a \$5 million Regional Prosperity grant from US Department of Housing and Urban Development. The initiative is intended to identify strategies to improve the region's economic prosperity by encouraging stronger, more sustainable communities, integrating housing and jobs planning, fostering local innovation in support of new jobs and building a healthy regional economy. The three pronged planning efforts include the Economic Opportunity Strategy, a Housing the Workforce Initiative, and an Equity Collaborative. The final Regional Economic Prosperity Strategy will include a framework and action plan to inform local and regional economic development activities, workforce training and job placement programs, and small business development initiatives. For more information see: <http://www.onebayarea.org/regional-initiatives/Bay-Area-Prosperity-Plan.html>.

C36-2: The discrepancy in the industrial employment trends you cite depend in part on how "industrial" employment is defined. Specifically, ABAG and MTC expect manufacturing to decline by 5.5 percent over the next 30 years, while goods movement related industries—wholesale; retail; and transportation and warehousing—to increase by 20 percent, 17 percent and 32 percent respectively. The forecast assumes that the number of jobs in sectors such as agriculture and manufacturing will grow according to the existing distribution of jobs in each of these sectors. The manufacturing sector lost approximately 300,000 jobs between 2000 and 2010 in the Bay Area. By 2040 manufacturing job levels are expected to be slightly greater than 2010 levels, but never reaching the 2000 pre-recession totals. This is because over time manufacturing firms can produce more with fewer workers and productivity growth in the sector is expected to continue. For more information on employment trends and the regional employment forecast see: http://onebayarea.org/pdf/Draft_Plan_Bay_Area/Draft_PBA_Forecast_of_Jobs_Population_and_Housing.pdf

- C36-3: The comment notes findings from the 2008 Goods Movement/Land Use Study, which found that as industrial land uses move further from the core of the region, emissions and vehicle miles traveled are anticipated to increase. The Goods Movement/Land Use Study was based on a different set of assumptions than Plan Bay Area. The analysis of the Plan includes a 2040 forecast for housing, jobs and population, which accounts for anticipated locations of jobs, including industrial and manufacturing, in 2040. The emissions associated with the anticipated locations of those uses are included in the analysis completed for the Draft EIR.
- C36-4: The comment claims that the Draft EIR does not adequately take into account additional emissions that will occur due to the dispersion of industrial and manufacturing land uses. As noted in response C36-3, the Draft EIR includes estimates of vehicle miles traveled, air quality emissions and greenhouse gas emissions for the forecast transportation networks and land use plan in 2040. Those forecasts include forecasts of the locations of industrial and manufacturing activity. The comment also requests that analysis be done regarding the pressure local land use decisions and Priority Development Areas place on industrial uses. In addition, it is important to note that PDAs are identified by local jurisdictions. While the proposed Plan is built on a PDA framework, neither MTC nor ABAG has local land use authority and implementation of the Plan is up to local jurisdictions. See Master Response I regarding the PDA process and Master Response A.1 regarding local control.

Letter C37 Julane Jazzique (5/14/2013)

- C37-1: The Plan proposes a land use development pattern based in part on Priority Development Areas (PDAs) voluntarily designated by local jurisdictions, and thus does not result from a “top-down” planning process. See Master Response I regarding the PDA selection process. While the Plan proposes this land pattern, neither MTC nor ABAG has local land use authority and implementation of the Plan is up to local jurisdictions. Please see Master Response A.1 for additional information regarding local control of land uses. Furthermore, contrary to Commenter’s suggestion, both MTC and the ABAG Board consist of elected officials from Bay Area cities and counties.

See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. MTC and ABAG followed CEQA requirements for public noticing of the EIR. Please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

Please refer to Master Response B.1 on population projections and Master Response D.2 on the connection between high-density housing near transit and the reduction of greenhouse gases. Chapter 2.5 of the Draft EIR analyzes GHG emissions from transportation sources and explains the methodology; Chapter 3.1 shows that the No Project alternative would not attain the SB 375 GHG emissions reduction targets. . See Master Response F regarding Displacement.

Water supply and public utilities are analyzed in Chapter 2.12, sea level rise in Chapter 2.5, and public services in Chapter 2.14. The comment does not provide details or evidence to support commenter’s opinion that the Draft EIR is inadequate in addressing these topics. See Master Response A.3 on the level of specificity in a program EIR, which analyzes environmental impacts at the regional level. Also please refer to Master Responses E on sea

level rise and G on water supply. The EIR cites specific mitigation measures in each chapter that, if implemented by implementing agencies and/or project sponsors, will mitigate the effects of these impacts.

MTC and ABAG will take the significant and unavoidable impacts of the proposed Plan into account in their deliberations on this EIR and the Plan.

Letter C38 Anonymous (5/16/2013)

- C38-1: See Master Response A.1 regarding local control over land use. Please refer to Master Response C on requests for extensions of the public comment period.
- C38-2: Please refer to Master Response A.1 for more information on the relationship between Plan Bay Area and local control over land use and local regulations.
- C38-3: The MTC Commission and ABAG Executive Board will vote to decide approval of the Plan. The MTC and ABAG boards consist of elected representatives from counties and cities within the region, therefore, MTC's and ABAG's decisions reflect the decisions of these elected officials.
- C38-4: See response C38-3.
- C38-5: As part of the EIR process, MTC is required to respond to each comment that raises a significant environmental issue on the EIR. Consistent with CEQA, responses are provided in this Final EIR.
- C38-6: See response C38-3.
- C38-7: Page 2.3-5 of the Draft EIR explains that ABAG projections, independent of the proposed Plan, foresee shifts in housing demand by 2040 that would result in single-family homes being demanded by 39 percent of households in the region, down from 56 percent in 2010. If that projection holds true, then the region already has more single-family home supply than will be in demand in 2040, but that page also notes that "[a]lthough this suggests no demand for newly constructed single-family homes, some production will likely occur as the Bay Area housing market adjusts to these trends." See Master Response B.1 for more information on the population projections and Master Response B.2 regarding PDA Feasibility.
- C38-8: The EIR is an environmental document that identifies potential environmental impacts and changes to the environment that could occur as a result of the proposed Plan. CEQA does not require economic impacts to be evaluated as part of an EIR.
- C38-9: Plan Bay Area is a regional plan, and the accompanying EIR is "a programmatic document that presents a region-wide assessment of the potential impacts from the proposed Plan Bay Area." (Draft EIR, Executive Summary, p. ES-2.) Please see Master Response A.1 regarding local control over land use planning and Master Response A.3 on the specificity of a program EIR.
- C38-10: The proposed Plan is subject to CEQA and, as a result, this program EIR is being prepared. MTC and ABAG are serving as joint lead agencies in preparing this program EIR for the

proposed Plan. Pursuant to Section 15367 of the State CEQA Guidelines, the lead agency is the “public agency which has the principal responsibility for carrying out or approving a project.” The lead agency is “responsible for preparing an EIR...for the project.” (CEQA Guidelines, Section 15050(a)) Therefore, no conflict of interest arises as a result of MTC and ABAG developing the proposed Plan and serving as lead agencies for the EIR.

- C38-11: The projected population growth described in the proposed Plan and in the EIR is projected to occur even in the absence of Plan Bay Area. It will continue to be the responsibility of local jurisdictions to fund the public services for growth that occurs in their respective jurisdictions, which, because these jurisdictions retain the right to approve development locally, may or may not correspond with the allocations described in the proposed Plan.
- C38-12: CEQA does not require economic impacts to be evaluated as part of an EIR.
- C38-13: See response C38-9.
- C38-14: The EIR includes an analysis of geology and seismicity in Chapter 2.7, and an evaluation of sea level rise in Chapter 2.5, which also provides a number of adaptation strategies. Please refer to Master Response E for a detailed description of the sea level rise analysis in the EIR. The scale of review in the Draft EIR is a function of the programmatic nature of the document. See Master Response A.3 regarding the level of specificity of a program EIR.
- C38-15: Commenter’s opposition to the proposed Plan is acknowledged. Public hearings such as the one that cited in the comment are intended to gather comments that are then responded to in this Final EIR.

Letter C39 Denise Beck (5/15/2013)

- C39-1: As discussed on page 1.2-11 of the Draft EIR, the U.S. Department of Transportation requires that metropolitan planning organizations, such as MTC, prepare long-range transportation plans and update them every four years. The proposed Plan represents that update from the Transportation 2035 Plan, adopted in 2009. This EIR evaluates potential environmental impacts that could result from implementation of the proposed Plan. Mitigation measures are provided for each potentially significant impact. Some mitigation measures will be carried out by MTC and/or ABAG. Other mitigation measures are designed so that if considered and implemented by an implementing agency and/ or project sponsor, impacts from the plan will be reduced to the extent feasible. See Master Response A.1 and A.3 regarding local control over land use and the level of specificity in the EIR. For mitigation measures related to the impact areas mentioned in the comment, please refer to the following chapters: Air Quality (2.2), Climate Change and Greenhouse Gases (2.5), Land Use and Physical Development (2.3), Biological Resources (2.9), Water Resources (2.8), Public Utilities and Facilities (2.12). For a detailed description of the analysis of population displacement, please refer to Master Response F.

In its consideration of this EIR and the Draft Plan, MTC and ABAG may find that the proposed Plan would create significant and unavoidable environmental impacts, but that these impacts would be outweighed by other benefits, including having fewer impacts than under a No Project scenario.

C39-2: This issue is analyzed in Chapter 2.12, which explained that mitigation measures 2.12(a) through (c) would reduce the impact to less than significant, but concluded a significant and unavoidable impact since MTC and ABAG cannot require local implementing agencies to adopt the mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. As discussed under Impact 2.12-1, the Urban Water Management Plans (UWMPs) for the major water suppliers of the region indicate adequate water supplies for the amount of the region's projected growth, at a regional level. This amount of population growth and development projected for the region will occur regardless of the proposed Plan and would be the actual cause of any impacts from expansions of water supply. In other words, these impacts will occur with or without Plan Bay Area, as shown in Chapter 3.1 of the Draft EIR. Please refer to Master Response G on a description of water supply requirements for this regional program-level EIR.

The current 2010 Marin Municipal Water District's (MMWD) Urban Water Management Plan indicates adequate water supplies through the year 2035 without a need to resort to desalination. The proposed Plan would result in essentially the same year 2040 population as under the No Project alternative - a three percent increase overall, with the proposed Plan resulting in 500 more households in Marin County than under the No Project scenario. Given the water supplies indicated by MMWD, it is extremely unlikely that additional water supplies will need to be acquired due to growth under the proposed Plan. Per the UWMP Section 3.3, the district has coordinated its future water demands through 2035 through the Sonoma County Water Agency (SCWA), and SCWA's UWMP. Furthermore, as explained in the UWMP, the MMWD has a contracted volume of 14,300 acre-feet per year with SCWA; as of 2035, the MMWD anticipates needing no more than 8,500 acre-feet per year from this contracted volume. We assume that the Sonoma County Water Agency's supply and demand figures incorporate their obligations to MMWD; also note that Table 2.12-4 relates to a single dry year, for which water supply agencies typically apply water conservation requirements on customers, which will likely allow SCWA to reduce demand to meet supply. The details of providing adequate water are the responsibility of water supply agencies; the implementation of 2.12(a), (b), and (c) would mitigate these impacts to a less than significant level.

C39-3: Chapters 2.1 through 2.14 of the Draft EIR analyze the potential impacts of the proposed Plan and recommend related mitigation measures. See responses C39-1 and C39-2 as well.

Letter C40 Glen Bossow (5/16/2013)

C40-1: Please refer to Master Response D.2 on the connection between high-density housing near transit and reduced greenhouse gas emissions. See Master Response D.1 regarding the SB 375 GHG reduction analysis.

C40-2: Please refer to Master Response G on water supply. See response B30-5 regarding Marin Municipal Water District and desalination.

C40-3: Please refer to Master Response B.1 for more information on population projections, and the relationship between ABAG and DOF projections.

C40-4: This issue is effectively covered in Chapter 2.2 of the Draft EIR, under Impacts 2.2-5(a), (b), and (c), pp. 2.2-38 through 83. The Draft EIR proposes Mitigation Measure 2.2(d) to reduce these impacts.

C40-5: Alternative 5 is identified as the Environmentally Superior Alternative. Please see Chapter 3.1 for a comparative impact analysis of alternatives.

Letter C41 Carl Fricke (5/16/2013)

C41-1: Please refer to Master Response C on requests for extensions of the public comment period.

C41-2: As the comment notes, the Marinwood Area is within a Priority Development Area—the Urbanized 101 Corridor. This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors.

C41-3: The comment does not cite specific examples of inconsistencies. Please refer to Master Response B.1 for more information on population projections. Since local governments retain authority over local land use decisions, they will ultimately decide the extent to which the proposed Plan is implemented within their jurisdiction. See Master Response A.1 on local control over land use.

C41-4: The proposed Plan does not call for the elimination of or defunding of roads, and in fact devotes a significant portion of its budget to operating and maintaining the existing roadway system. The Draft EIR, on p. 1.2-49, notes that the proposed Plan allocates over 79 percent of its budget to committed projects, which include many highway and roadway projects, and the remaining discretionary funds are allocated mainly to “fix it first” projects with 88 percent of discretionary funds going to operations and maintenance. “Compared to Transportation 2035, the proposed Plan Bay Area would spend a higher percentage of its budget on transit and roadway operations and maintenance, less on expansion of transit network, and roughly the same percent on road and bridge expansion.” (Draft EIR, p. 1.2-49.) In addition, as Table 1.2-10 of the Draft EIR shows, the proposed Plan will increase road and bridge operations and maintenance from 30 percent of the overall Transportation 2035 budget to 32 percent of the Plan Bay Area budget, an increase of \$28 billion (see updated numbers in Section 2.2 of this Final EIR); these funds are available due to a decrease in the proportion and amount of money to be spent on transit system expansion compared to the last RTP. In light of this transportation investment strategy, the proposed Plan clearly supports a continuation of personal automobile use. MTC must fund a transportation system that serves a growing population and many lifestyles, while achieving GHG emissions reduction targets assigned by the State; and this requires supporting transit as well as roadway systems. The proposed land use pattern attempts to concentrate growth within transit-served locations, thereby lessening future growth and traffic pressures on rural roadways.

C41-5: This EIR evaluates Plan Bay Area as a single, regional project and assesses its impacts at a regional level across all nine counties, which is consistent with CEQA provisions regarding program EIRs. See Master Response A.3 regarding specificity of a program EIR.

C41-6: Funding of Plan implementation is not an environmental issue under CEQA, and thus is not analyzed in the EIR.

- C41-7: The Draft EIR provides a regional-scale evaluation of public services, including police, fire and schools, in the Draft EIR, Chapter 2.14, Public Services. The chapter analyzes the potential impacts and provides adequate mitigation measures to lessen these impacts. Local jurisdictions will continue to be responsible for ensuring that adequate funds are identified to support public services for new local development. See Master Response A.1 and response C41-3 regarding local control and implementation.
- C41-8: MTC and ABAG acknowledge that the EIR found 39 significant and unavoidable impacts, partially due to the fact that they do not have land use authority to mitigate these impacts. MTC and ABAG may find that the proposed Plan would create significant environmental impacts, but that these impacts would be outweighed by other benefits, including having fewer impacts than the No Project alternative. Please refer to Master Response G on water supply. For an analysis of the exposure to hazardous materials, please refer to the Draft EIR, Chapter 2.13, Hazards. For an analysis of the proposed Plan's impacts on wastewater treatment capacity, please refer to Draft EIR, Chapter 2.12, Public Utilities and Facilities. For a detailed description of the sea level rise analysis conducted in the Draft EIR, please refer to Chapter 2.5, Climate Change and Master Response E on sea level rise. Please refer to the Draft EIR, Chapter 2.9, Biological Resources, for the full analysis of the proposed Plan's potential impacts on biological resources as well as mitigation measures to lessen these potential impacts.
- C41-9: The proposed Plan is a regional plan, and its environmental effects are evaluated at the regional level in a program EIR. Please see Master Response A.3 on the level of specificity of a program EIR.
- C41-10: Chapter 2.12 of the Draft EIR analyzes the proposed Plan's impacts on water supply. Please also refer to Master Response G on water supply. An analysis of the energy needed to provide such water is outside the scope of the Plan. See Master Response A.3 regarding the level of specificity in the EIR.
- C41-11: Please refer to responses C41-1 through 10 above.

Letter C42 Frank Egger (5/15/2013)

- C42-1: Please refer to Master Response G on water supply. Additionally, Chapter 2.12, Public Utilities and Facilities, describes the impacts and mitigation measures of the proposed Plan on water supply and wastewater collection, transport, and treatment. Note that the projected population increase will occur with or without the proposed Plan.
- C42-2: The Urban Water Management Plans (UWMPs) for the major water suppliers of the region generally cover the period of time through 2035. The latest UWMPs indicate that, except for Solano County, adequate water supplies already exist during normal years through 2035 for an aggregate population greater than that accommodated by Plan Bay Area in 2040 (Draft EIR, pp. 2.12-19 to 23). The UWMPs generally indicate few to no planned actions to undertake capital projects to acquire additional water supplies or storage; if they do, any environmental impacts from these actions would not be as a result of the proposed Plan as the UWMPs existed prior to Plan Bay Area - the two are not connected. Furthermore, the population growth and development projected for the region will occur regardless of the proposed Plan and would be the actual cause of any impacts from expansions of water supply - these impacts will occur with or without Plan Bay Area, as shown in Chapter 3.1 of

the Draft EIR. Water supply and wastewater treatment are not functions of MTC or ABAG; these are and will remain the function of local service providers whose role is to provide adequate utilities for existing and projected customers.

- C42-3: This issue is analyzed under Impact 2.12-4 in the Draft EIR, p. 2.12-56, which finds a potentially significant impact and proposes mitigation measures which would reduce the impact to less than significant, if implemented. GHG emissions from wastewater treatment are factored into land-based GHG generation and are the same across all the Plan alternatives, as the population growth is independent of Plan Bay Area.
- C42-4: Please refer to response C42-2.
- C42-5: The Draft EIR notes two statutes, which are described in the regulatory setting of Draft EIR Chapter 2.12 (pp. 2.12-43 and 44) and cited in the impact analyses, related to role of local jurisdictions regarding adequate water supply and new developments: “The enforcement of SB 610 and SB 221 by local jurisdictions should ensure that an adequate water supply is available for large residential developments prior to their approval.” (Draft EIR p. 2.12-47).
- C42-6: The current MMWD Urban Water Management Plan indicates adequate water supplies through the year 2035. The proposed Plan would result in essentially the same year 2040 population as under the No Project alternative - a three percent increase, with the proposed Plan resulting in 500 more households in Marin County than under the No Project scenario. Given the water supplies indicated by MMWD, it is extremely unlikely that additional water supplies will need to be acquired due to growth under the proposed Plan. Per the MMWD Urban Water Management Plan (UWMP) Section 3.3, the district has coordinated its future water demands through 2035 with the Sonoma County Water Agency (SCWA), and SCWA’s UWMP. Furthermore, MMWD has a contracted volume of 14,300 acre-feet per year with SCWA; as of 2035, MMWD anticipates needing no more than 8,500 acre-feet per year from this contracted volume.

It is the responsibility of individual wastewater treatment suppliers to provide adequate treatment capacity for existing and projected population in order to receive a valid NPDES permit, a federal program administered by the regional water quality control board. The Draft EIR does recognize that localized potentially significant impacts could occur on wastewater treatment capacity. As a consequence, Mitigation Measure 2.12(d) requires land development under the proposed Plan to undertake environmental assessments, “to determine whether sufficient wastewater treatment capacity exists for a proposed project. These environmental assessments must ensure that the proposed development can be served by its existing or planned treatment capacity, and that the applicable NPDES permit does not include a Cease and Desist Order or any limitations on existing or future treatment capacity. If adequate capacity does not exist, the implementing agency must either adopt mitigation measures or consider not proceeding with the project as proposed.”

The current MMWD Urban Water Management Plan indicates adequate water supplies through the year 2035 without a need to resort to desalination. In addition, in August of 2010, the District adopted Ordinance 420, which states that the District shall not approve construction, or financing for construction, of a desalination facility unless such construction is approved by a majority of District voters, voting in an election held within the District’s service area for that purpose. Therefore, this EIR does not assume any desalinated water will be used for Marin County water supplies.

- C42-7: See response C42-6.
- C42-8: The Draft EIR includes Mitigation Measures 2.12(a), (b), and (c) to reduce the impacts on water supply to a less than significant level, if implemented. For more information, refer to response C42-2.
- C42-9: The planning process and environmental review relied on the public planning documents of water supply and wastewater treatment agencies regarding their existing and planned capacity. These are cited, summarized, and analyzed quantitatively in Chapter 2.12 of the Draft EIR.
- C42-10: Issues of housing unit size, density, condo conversions, etc., remain within the discretion of local jurisdictions. Please refer to Master Response A.1 for a detailed description of local control over land use. The land development pattern in the proposed Plan and the transportation projects and programs are designed to limit future growth to existing urban footprint and growth restrictions, which, if implemented, will reduce sprawl considerably as compared with the No Project alternative. The Draft EIR demonstrates that per capita CO₂ emissions from cars and light duty trucks will decline under the proposed Plan. See Master Response D.1 regarding SB 375's GHG emissions reduction targets.
- C42-11: See responses C42-1 through 10 above.

Letter C43 Adrian Jordan (5/16/2013)

- C43-1: Please refer to Master Response C on requests for extension of the public comment period for the Plan Bay Area Draft EIR. The Marin County Housing Element Supplemental EIR is a separate document with its own timeline for public comment; MTC and ABAG have no control over that EIR. Plan Bay Area explicitly recognizes that local governments continue to exercise authority over land use within their borders; as such, the proposed Plan will not and cannot rezone any property. Please also refer to the response to Sharon Rushton's letter, comment number C-33, for a response to her comments and research, which also incorporates comments made by Geoffrey H. Hornek. See also Master Response A.1 regarding local control over land use planning.

Letter C44 Katherine Jain (5/14/2013)

- C44-1: The proposed Plan reduces the amount of land that would be urbanized in comparison to the No Project alternative and thereby aims to preserve greenbelt space throughout the Bay Area region. Please also see Master Response D.2 on the connection between high-density housing near transit and reduced GHG emissions. Also note that projected population growth in the region will occur regardless of the proposed Plan.
- C44-2: See responses C42-1, 2, 3, 5, 6, 8 and 9 and please refer to Master Response G for more information on the water supply analysis in the EIR.

Letter C45 Marian Johnson (5/17/2013)

- C45-1: CEQA does not require the EIR to evaluate the economic impact of the proposed Plan. The population and job growth anticipated in the entire region is projected to occur regardless of whether Plan Bay Area is adopted. Please refer to Chapter 3.1 of the draft EIR for a

comparison of traffic conditions under the proposed Plan as compared to the No Project alternative (which presents “business-as-usual” conditions for land use and transportation). In general across the region, the No Project alternative leads to per-capita congested vehicle miles traveled (VMT) levels that are 168 percent higher than the proposed project during the AM peak, 94 percent higher during the PM peak, and 123 percent higher over the course of a typical weekday. Per-capita VMT is six percent greater than the proposed Plan, resulting in the typical Bay Area resident driving approximately 21 miles per day. (Draft EIR, p. 3.1-20.)

The EIR evaluates environmental issues and presents mitigation to address potentially significant impacts of the proposed Plan. For specific mitigation measures related to biological resources, please refer to Chapter 2.9, Biological Resources. See Master Response A.3 regarding the level of specificity in the EIR.

The comment cites no evidence of increased crime rates. In addition, crime is not an environmental impact that requires a response under CEQA.

C45-2: Please refer to Master Response C on requests for extensions of the public comment period.

Letter C46 Roger L. Duba (5/15/2013)

C46-1: Priority Development Area—the Urbanized 101 Corridor—of which you write was nominated by the Marin Board of Supervisors, which adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. See Master Response I regarding the PDA process.

C46-2: Plan Bay Area, the region’s first integrated Regional Transportation Plan/Sustainable Communities Strategy, considers both transportation and housing as equally important issues that are fundamentally connected. The region’s robust highway and public transit networks (discussed on pages 2.1-1 through 2.1-7 of the Draft EIR) will be maintained and improved using \$292 billion in funding under the proposed Plan. These facilities provide transportation mobility across the region that allows for further housing development through the proposed Plan’s focused growth land use strategy. See Master Response D.2 for a discussion of how higher-density development patterns will support reductions in per-capita greenhouse gas emissions and growth in regional transit ridership. Integrated transportation and land use planning is one of the key elements of SB 375. Transportation investments and land use development should ideally be concurrent with each other. However, the actual timing of transportation and land use investments can vary depending on funding availability, project readiness, and market forces. The proposed Plan focuses growth around existing infrastructure. Transit service is one of the requirements for an area to be a PDA, around which much of the region’s growth is anticipated to occur, See Master Response I regarding the requirements to be a PDA and the PDA process.

C46-3: The comment correctly notes that transit ridership tends to be lower in lower-density suburban and rural areas compared to higher-density urban areas. However, the proposed Plan’s focused growth land use strategy should support growth in transit ridership across the region, a strategy that reduces greenhouse gases in combination with clean vehicle initiatives. Further discussion of the strengths of dense development in increasing transit usage and reducing greenhouse gases can be found in Master Response D.2.

The Draft EIR does not analyze greenhouse gas emissions impacts on a localized level; as a program EIR, it is focused on regional impacts. See Master Response A.3 on the level of specificity of a program EIR and Master Response D.1 regarding SB 375's GHG reduction requirements.

- C46-4: As the comment notes, the Marinwood Area is within a Priority Development Area—the Urbanized 101 Corridor. This PDA was nominated by the Marin Board of Supervisors, which adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. See Master Response I regarding the PDA process.

Letter C47 Bruce De Benedictis (5/15/2013)

- C47-1: The proposed Plan invests in all modes of public transportation, including local services (such as bus and light rail) and express services (such as heavy rail and commuter rail). This comment incorrectly states that public transit is not disaggregated by mode in the transportation impacts chapter. In fact, transit ridership (page 2.1-5), transit seat-miles (page 2.1-27), and transit utilization (page 2.1-37) data are all broken down by mode in the Draft EIR.

- C47-2: The proposed Plan focuses both on improving jobs-housing fit (bringing housing and jobs closer together) and on providing transportation alternatives to an automobile commute (such as heavy-rail BART service). These strategies work together to decrease the share of residents engaged in long-distance automobile commuting, as indicated by the reductions in per-capita VMT under Impact 2.1-4 of the Draft EIR. While some of the projects in the Draft Plan do benefit longer-distance trips, such as the Regional Express Lanes Network, most of the proposed Plan's investments are focused on improving existing communities by investing in continued local streets maintenance and transit operations and by constructing infrastructure to serve infill development and redevelopment in Priority Development Areas. Projects such as the Central Subway, AC Transit East Bay Bus Rapid Transit, and El Camino Real Bus Rapid Transit emphasize improved mobility within existing communities and support the focused growth land use pattern envisioned under the proposed Plan.

With regards to the land use impacts of transportation projects that serve long-distance travel patterns, the associated impacts of such projects are analyzed in Chapter 2.3 (under Impacts 2.3-1 and 2.3-2). Both of these impacts are identified as significant and unavoidable, but can be reduced to less-than-significant levels if local implementing agencies adopt the recommended mitigation measures.

Letter C48 Daniel G. DeBrusschere (5/15/2013)

- C48-1: The EIR does not “propose” any reallocation of street maintenance funds. As noted on page 1.2-50 of the Draft EIR, 33 percent of funding in the proposed Plan, or \$94 billion, is dedicated to operating and maintaining existing roads and bridges. As per SB 375, the region is required to reduce greenhouse gases emissions, which will be a benefit to all Californians, including those with disabilities. Future projects must comply with CEQA. Where applicable, future project-specific environmental analysis will consider potential project-specific impacts associated with commenter's concerns. See Master Response A.1 regarding local land use authority. Additionally, any possible future violations of the ADA within the

region may be remedied through legal channels as provided by the Act as well as related state and local laws.

- C48-2: This EIR does not assume that local authority and responsibility for local street maintenance would be usurped or that local jurisdictions' ADA obligations would change. The comment claims that local funding for street maintenance will be taken away from local jurisdictions that do not adopt the Plan. That is incorrect. One program that accounts for 4.9 percent of funding in the Plan, the OneBayArea Grant (OBAG) program, includes as a requirement for eligibility that the jurisdiction have an adopted housing element. However, a housing element is not the same thing as Plan Bay Area. Jurisdictions do not need to adopt Plan Bay Area to be eligible for OBAG. County Congestion Management Agencies are responsible for developing the list of OBAG projects. A certain percentage of OBAG funds in each county are to be directed to Priority Development Areas, however, this amount of funding is not equal to a jurisdiction's total funds for local streets and roads (much of which does not actually flow through MTC). No change in local government's ADA obligations, as already noted, is implied or expected. See Master Response A.1 regarding local land use authority.

Letter C49 Raymond Day (5/15/2013)

- C49-1: Your support for the No Project alternative is acknowledged.
- C49-2: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR. Please also see Master Response C regarding the public comment period for the Draft EIR.
- C49-3: The proposed Plan used the best available data available at the time, and was developed over a series of years involving multiple scenarios. The process engaged thousands of stakeholders through dozens of community meetings, forums, and public hearings held in each county. See response C49-2 for more information regarding public engagement. The purpose of this EIR is to consider environmental impacts including impacts to infrastructure.

See Master Response B.1 regarding population projections.

The regional land development pattern, or distribution of growth to individual jurisdictions, is not a forecast. It is a blueprint for growth to achieve the goals and objectives of the Sustainable Communities Strategy (SCS) and was developed through a variety of land use and transportation scenarios that distributed the total amount of growth projected for the region to specific locations. These scenarios sought to address the needs and aspirations of each Bay Area jurisdiction, as identified in locally adopted general plans and zoning ordinances, while meeting Plan Bay Area performance targets adopted by the agencies to guide and gauge the region's future growth.

The framework for developing these scenarios consisted of the Priority Development Areas (PDAs) and Priority Conservation Areas (PCAs) nominated by local governments. ABAG and MTC incorporated local feedback from individual jurisdictions relying on their best assessment of feasible growth over the plan period and then applied a series of additional

factors to achieve the goals of the SCS, as set by SB 375 and ARB. The scenarios were then developed through a transparent, deliberative process, during which public input was sought at every step along the way. After further modeling, analysis and public engagement, the five initial scenarios were narrowed down to a single preferred land use scenario.

As required by SB 375, the land use distribution in the proposed Plan identifies the locations that can accommodate future growth, including the scale and type of growth most appropriate for different types of locations. In order to meet the Bay Area's greenhouse gas (GHG) emissions reduction and housing targets, set by SB 375 and ARB, and to make progress toward meeting MTC and ABAG's adopted performance targets, the proposed Plan encourages future job and population growth in existing communities with access to existing or planned transportation investments.

For more on how the proposed Plan distributed projected regional growth, see the Supplemental Report *Forecast of Jobs, Population and Housing*.

- C49-4: Impacts to infrastructure including water, sewer, schools, and highways are assessed in Chapter 2.12, Public Utilities; Chapter 2.14, Public Services; and Chapter 2.1, Transportation of the Draft EIR. Please also refer to Master Response G for a detailed discussion of water supply for this regional Plan.
- C49-5: See Master Response B.1 regarding population projections.
- C49-6: See Master Response D.2 for more information on the relationship between high density housing near transit and reduced greenhouse gas emissions. See also Master Response A.3 regarding the level of specificity in the EIR.
- C49-7: See Master Response D.2 for more information on the relationship between high density housing near transit and reduced greenhouse gas emissions.
- C49-8: The proposed Plan does not seek to increase segregation by income but rather the opposite by creating more housing choices for households at all income levels.

MTC and ABAG support Habitat for Humanity single family home rehabilitation, second units, equity sharing programs, senior housing and other policies and programs to increase diversity and housing choices, and also recognize that the most successful developments are those that mix market rate housing with more affordable options to house a range of households at different income levels. SB 375 requires metropolitan areas to create a Sustainable Communities Strategy (SCS) for the Regional Transportation Plan that aligns land use and transportation planning in order to reduce greenhouse gas emissions from cars and light-duty trucks. Addressing these different mandates requires achieving a balance between the more focused growth pattern necessary to achieve GHG emission reductions and the need to ensure that every jurisdiction contributes its "fair share" toward meeting the region's housing need.

The land development pattern in the proposed Plan directs housing growth to areas throughout the region (including PDAs and non-PDA areas) with high levels of transit service, low vehicle miles traveled (which is strongly correlated with GHG emissions), high employment in 2040, a high number of low-income workers commuting from other places, and high housing values. Particular emphasis was placed on home values, which was given a

weight of three in the formula, while low-income in-commuting was given a weight of two, and 2040 employment was given a weight of one. Each jurisdiction was ranked and scored on each of the three factors, and then the three were combined. A jurisdiction with a larger positive combined factor score received more housing units, while a jurisdiction with a smaller negative combined factor score received fewer housing units. These factors aim to expand housing and transportation options; increase access to jobs, particularly for low-income workers; and promote housing growth in places with high-quality services, such as parks, and schools. In particular, the methodology directs more housing to jurisdictions that currently offer the fewest affordable housing options. PDAs exist in a variety of wealthy jurisdictions and the presence (or lack) of a PDA does not prevent a jurisdiction from receiving its fair share of housing growth.

C49-9: MTC recognizes the importance of all modes of passenger transportation, including automobiles, public transit, walking, and bicycling. While public transit may not be appropriate for all trip purposes, Plan Bay Area invests in existing and new public transit services to make it a more time-competitive option for individuals across the region. At the same time, the proposed Plan funds improvements to the highway system, including freeway interchange operational improvements, new high-occupancy vehicle lanes, and a network of regional express lanes, all of which are designed to improve the transportation system for individuals who continue to drive to their daily destinations. The proposed Plan also devotes a significant portion of its budget to operating and maintaining the existing roadway system. The Draft EIR, on p. 1.2-49, notes that the proposed Plan allocates over 80 percent of its budget to committed projects, which include many highway and roadway projects, and the remaining discretionary funds are allocated mainly to “fix it first” projects with 88 percent of Plan revenues going to operations and maintenance: “Compared to Transportation 2035, the proposed Plan Bay Area would spend a higher percentage of its budget on transit and roadway operations and maintenance, less on expansion of transit network, and roughly the same percent on road and bridge expansion.”

In addition, as Table 1.2-10 of the Draft EIR shows, the proposed Plan will increase road and bridge operations and maintenance from 30 percent of the overall Transportation 2035 budget to 32 percent of the Plan Bay Area budget, an increase of \$28 billion (see updated numbers in Section 2.2 of this Final EIR); these funds are available due to a decrease in the proportion and amount of money to be spent on transit system expansion compared to the last RTP. In light of this transportation investment strategy, the proposed Plan clearly supports a continuation of personal automobile use. MTC must fund a transportation system that serves a growing population and many lifestyles while hitting targets assigned by the State, and this requires supporting transit as well as roadway systems. The proposed land use pattern attempts to concentrate growth within transit-served locations, thereby lessening future growth and traffic pressures on rural roadways.

Letter C50 Vickie Day (5/15/2013)

C50-1: Your support for the No Project alternative is noted.

C50-2: This issue is directly addressed in Chapter 2.2 of the Draft EIR, under Impacts 2.2-5(a), (b), and (c), pp.2.2-38 through 83. The Draft EIR proposes Mitigation Measure 2.2(d) to reduce these impacts to the extent feasible.

Letter C51 Sidney (Susan) Dent (5/16/2013)

- C51-1: The EIR evaluates the potential environmental impacts and changes that could occur as a result of the proposed Plan. Please refer to Chapter 2.9, Biological Resources, for an analysis of the possible biological impacts of the proposed Plan.
- C51-2: The population and job growth anticipated in the region will happen regardless of the Plan; see Master Response B.1 on population projections. Chapter 2.1 of the Draft EIR found that compared to existing conditions, the proposed Plan would not have a significant impact on commute travel times, non-commute travel times, or per capita vehicle miles travelled, although it would have a significant and unavoidable impact on per capita congested vehicle miles traveled; Chapter 3.1 found that the No Project alternative would also have this significant and unavoidable impact with congestion substantially greater than the proposed Plan as a result of fewer road and transit expansion projects. Chapter 2.5 found that the proposed Plan would not have adverse significant impacts related to GHG emissions. Water supply is assessed in Chapter 2.12 which found that at a regional level there are no significant impacts as the Urban Water Management Plans (UWMPs) for the major water suppliers of the region indicate adequate water supplies for the amount of the region's projected growth, at a regional level. See also Master Response G regarding water supply. In the case of a localized water shortage caused by the distribution of growth under the proposed Plan, mitigation measures 2.12(a) through (c) would reduce the impact to less than significant, if applied by the implementing agency. See Master Response A.3 regarding the level of specificity in the EIR.
- C51-3: The proposed Plan is designed specifically to reduce per capita GHG emissions from cars and light trucks, per SB 375. See Chapter 2.5 of the Draft EIR for more details. See Master Response D.1 regarding SB 375 GHG reduction targets.

Letter C52 Sidney Dent (5/15/2013)

- C52-1: See responses to letter C51.

Letter C53 Eric Egan (5/16/2013)

- C53-1: Please refer to Master Response C on requests for extensions of the public comment period.
- C53-2: As the comment notes, the Marinwood Area is within a Priority Development Area—the Urbanized 101 Corridor. This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the proposed Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors.

Letter C54 Stephen Einhaus (5/15/2013)

- C54-1: Your support for the No Project alternative is acknowledged. As the comment notes, the Marinwood Area is within a Priority Development Area—the Urbanized 101 Corridor. This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG

Executive Board and is therefore included in the Draft Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors.

Letter C55 Charles Cagnon (5/16/2013)

C55-1: Economic issues such as price elasticity are beyond the scope of CEQA. See Master Response B.1 for further information on the population projections.

The proposed Plan seeks to create more housing choices for households at all income levels, regardless of ethnicity.

Many public workshops were held around the region during development of the proposed Plan and after the release of the Draft Plan, including a public hearing in each of the nine Bay Area counties; public comments made on the EIR at those Draft Plan hearings can be found in category “E” in Section 3 of this Final EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan.

C55-2: See Master Response B.1 for more information on population projections. The Draft EIR notes, on p. 2.3-5, that supply and demand of housing type, which would likely manifest as price, is taken into account: “The projected oversupply of single-family homes is expected to reduce demand for other housing types by almost 170,000 units as some households that would otherwise choose multifamily units instead opt for single family homes made more affordable due to excess supply.” MTC and ABAG acknowledge that the land use pattern in the proposed Plan deviates from the “business as usual” development scenario in the No Project alternative. It does so in order to fulfill the GHG emissions reduction mandates of SB 375, better attain the adopted objectives of Plan Bay Area, and to avoid or reduce environmental impacts.

C55-3: These comments do not raise environmental concerns that require a response under CEQA. See Master Response F regarding displacement.

C55-4: See response C55-1. For the EIR process, MTC and ABAG followed CEQA requirements for public noticing of the EIR. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

Letter C56 Bob Cohen (5/16/2013)

C56-1: This comment suggests that climate models currently used by the scientific community do not account for all of the processes that may affect global temperatures; therefore these models should not be used to develop environmental policy. The global climate science community is continually advancing the state of the science with respect to understanding historic climate change and developing models to assist in the larger understanding of how the climate may change over time in the future. The Draft EIR relies on the best information and science available, at the time of this Draft EIR, to evaluate alternatives and compare findings. Although no single global climate model may accurately predict the future, the use of these models for comparison purposes is reasonable and defensible for the purposes of a Draft EIR.

Regardless of any differences of opinion on the causes and existence of climate change, Plan Bay Area is required to adhere to the GHG emissions reductions targets established by SB 375.

- C56-2: This comment extends comment C56-1 to questions regarding the rates of sea level rise used in the Draft EIR, due to uncertainties associated with the accuracy of the available global climate models. The commenter suggests that sea level is not dependent on changes in CO₂. The Draft EIR relies on the best science available at the time of this Draft EIR, and information on the appropriate sea level rise rates to use for the San Francisco Bay region were derived from multiple sources, including IPCC, the California Climate Action Team's 2010 Interim Guidance Document ⁴, and the recent 2012 National Research Council Report ⁵. Although there is a degree of uncertainty associated with estimates of future rates of sea level rise, as each respective study reports, there is agreement between the respective studies that sea level rise in the San Francisco Bay region is increasing beyond historical rates of sea level rise. The commenter is not questioning the general findings of the Draft EIR, but questioning the available climate science data.
- C56-3: The commenter suggests that sea level rise trends are not increasing and predictions of extreme sea level rise are incorrect. See response C56-2.
- C56-4: The commenter suggests that any conclusions reached using regional climate models are wrong and have no basis in this report. See responses C56-1 and 2.
- C56-5: The commenter suggests that any decreases in CO₂ that might occur in the Bay Area will have little, if any, effect on either temperatures or the rate of sea level rise. Regardless of any differences of opinion on the causes and existence of climate change, Plan Bay Area is required to adhere to the GHG emissions reductions targets established by SB 375.
- C56-6: Your opposition to the proposed Plan and the EIR are noted.

Letter C57 Anne Cole (5/15/2013)

- C57-1: Your support for the No Project alternative is acknowledged.
- C57-2: See response C49-2.
- C57-3: See responses C49-3 and C49-4.
- C57-4: See responses C49-5 and C49-8.

⁴ Sea-Level Rise Task Force of the Coastal and Ocean Working Group of the California Climate Action Team. State of California Sea-Level Rise Interim Guidance Document. Developed with science support provided by the Ocean Protection Council's Science Advisory Team and the California Ocean Science Trust, October 2010.

⁵ National Research Council. Sea-level rise for the Coasts of California, Oregon, and Washington: Past, Present, and Future. Prepared by the Committee on Sea Level Rise in California, Oregon, and Washington and the National Research Council Board on Earth Sciences and Resources and Ocean Studies Board Division on Earth and Life Studies. Pre-publication copy, 2012

- C57-5: Please refer to Master Response D.2 on the connection between high-density housing near transit and reduced greenhouse gas emissions. As the proposed Plan is a regional level plan, GHG analysis is done on a regional level, and county-specific analysis is not part of the regional-level EIR. See Master Response A.3 regarding the level of specificity in the EIR.
- C57-6: See Chapter 3.1 of the Draft EIR for the analysis of GHG emissions reduction performance by the project alternatives. In terms of alternative methods of reduction, SB 375's mandate that the SCS must reduce per capita GHG emissions from cars and light trucks to the assigned targets requires MTC and ABAG to reduce vehicle miles travel by these modes, with the main strategies available being reducing trip length by placing housing closer to jobs and vice-versa and shifting more trips onto other travel modes (transit, walking, biking). See Master Response D.1 regarding the calculations in the SB 375 GHG analysis. For a description of the connection between transit and reduced greenhouse gas emissions, refer to Master Response D.2, which also contains information on the greenhouse gas emissions of public transit versus that of cars and light trucks.
- C57-7: See response C49-8.
- C57-8: CO₂ and PM emissions from all transportation modes are included in the modeling used in Chapters 2.2 (air quality) and 2.5 (GHG) of the Draft EIR. As the proposed Plan is a regional level plan, GHG analysis is done on a regional level, and county-specific analysis is not part of the regional-level EIR. See Master Response A.3 regarding the level of specificity in the EIR. See Master Response D.1 regarding the calculations in the SB 375 GHG analysis.

Letter C58 Leal Charonnat (5/1/2013)

- C58-1: MTC and ABAG acknowledge your concern regarding the importance of infill development. While the proposed Plan aims to direct development into PDAs, which represent infill areas region-wide that are suitable for development intensification, ultimately it remains a choice and responsibility of local governments to direct development to infill locations and to build out their allocated urban areas. Please refer to Master Response A.1 for more information on local control over land use.

Letter C59 Peter Hensel (5/15/2013)

- C59-1: Please refer to Master Response G on a description of water supply requirements for this regional program-level EIR. The most recent versions of Urban Water Management Plans (UWMPs) were prepared in 2010 per the additions to the Urban Water Management Planning Act in 2005. These plans specify the specific water needs and facilities for each urban water management agency. The water supply analysis in Chapter 2.12 found that mitigation measures 2.12(a) through (c) would reduce impacts to less than significant, but had to find a significant and unavoidable impact since MTC and ABAG cannot require local implementing agencies to adopt the mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. As discussed under Impact 2.12-1, the UWMPs for the major water suppliers of the region indicate adequate water supplies for the amount of the region's projected growth, at a regional level. This amount of population growth and development projected for the region will occur regardless of the proposed Plan and would be the actual cause of any impacts from expansions of water supply - these impacts will occur with or without Plan Bay Area, as shown in Chapter 3.1 of the Draft EIR.

As per SB 610 and SB 221, which are described in the regulatory setting of Draft EIR Chapter 2.12 (pp. 2.12-43 and 44) and cited in the impact analyses: “The enforcement of SB 610 and SB 221 by local jurisdictions should ensure that an adequate water supply is available for large residential developments prior to their approval.” (Draft EIR p. 2.12-47).

- C59-2: Projecting and managing water demand is a responsibility of individual water supply agencies. The EIR analysis relies on the analysis in local UWMPs.
- C59-3: It would be too speculative for this EIR to assess the impacts of unforeseeable extreme weather shifts during the lifetime of the proposed Plan, and beyond the scope of the analysis required under CEQA.
- C59-4: This comment is general and not related the implementation of the proposed Plan. Please refer to Master Response G on water supply for a detailed description of water supply analysis in the EIR. The Urban Water Management Plans relied upon in this EIR are required to analyze supply and demand scenarios for multiple-dry years.
- C59-5: The current MMWD Urban Water Management Plan indicates adequate water supplies through the year 2035 without a need to resort to desalination. The proposed Plan would result in essentially the same year 2040 population as under the No Project alternative - a three percent increase, with the proposed Plan resulting in 500 more households in Marin County than under the No Project scenario. Given the water supplies indicated by MMWD, it is unlikely that additional water supplies will need to be acquired due to growth under the proposed Plan.
- C59-6: The Draft EIR describes these statutes in the regulatory setting of Chapter 2.12, on pages 2.12-43 and 44. The proposed Plan does not directly authorize any development and is therefore not a “project” as defined by Water Code section 10912, rather it is a long-term transportation investment and land use pattern strategy. Therefore the Plan is not subject to the requirements of SB 610 or SB 221. Land development projects developed under the proposed Plan must undergo their own environmental review and adhere to those statutes if they apply. See Master Response A.2 regarding additional CEQA review for projects and Master Response G for a detailed description of the water supply impact analysis required of a regional-scale program EIR. Furthermore, note that the population growth anticipated for the region will occur with or without the proposed Plan.
- C59-7: See response C59-6, Master Response A.1 on local control over land use, and Master Response B.1 on population projections. SB 375 explicitly states that an SCS does not and may not usurp local land use control. The population projections were undertaken to estimate the region’s growth through 2040, and are independent of the Plan and EIR. Priority Development Areas (PDAs) were nominated and approved by local jurisdictions, not selected by MTC or ABAG. Local jurisdictions are not obligated to endorse, pursue, or adopt Plan Bay Area, and face no punishment if they do not do so; they will forgo eligibility for some OneBayArea Grant funds, which are intended to help plan for the growth anticipated. The proposed Plan is a separate project from the RHNA, which will use the growth blueprint Plan Bay Area as one of several considerations.
- C59-8: This issue is analyzed under Impact 2.12-4, which found that mitigation measures 2.12(a) through (h), adopted and implemented by an individual project as feasible, would reduce the impact to less than significant, but had to find a significant and unavoidable impact since

MTC and ABAG cannot require local implementing agencies to adopt the mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. As discussed under Impact 2.12-1, the Urban Water Management Plans (UWMPs) for the major water suppliers of the region indicate adequate water supplies for the amount of the region's projected growth, at a regional level. This amount of population growth and development projected for the region will occur regardless of the proposed Plan and would be the actual cause of any impacts from expansions of water supply - these impacts will occur with or without Plan Bay Area, as shown in Chapter 3.1 of the Draft EIR. In the case of a localized water shortage caused by the distribution of growth under the proposed Plan, mitigation measures 2.12(a) through (h) will reduce the impact to less than significant, if applied by the implementing agency.

C59-9: Your support for the No Project alternative is acknowledged.

Letter C60 Peter Hensel (5/15/2013)

C60-1: The proposed Plan is designed to meet the mandates of SB 375 to ensure adequate housing for anticipated growth and reduce per capita GHG emissions from cars and light trucks, with the intention of reducing the long-term adverse effects of climate change. The proposed Plan has also been designed to pursue the objectives adopted by MTC and ABAG, as described in Chapter 1.2 of the Draft EIR, which include improving health, safety, circulation, and the economy concurrently. This approach is consistent with Section 21001 (b) of the Public Resource Code

C60-2: Potential impacts to biological resources are analyzed relative to appropriate thresholds of significance. As presented in Chapter 2.3, Land Use in Table 2.3-2, detached/ single-family homes constituted 56 percent of the share of demand in 2010, and are predicted to constitute 39 percent of demand as of 2040, the highest percentage of all building types. Therefore, under the proposed Plan, single-family neighborhoods will remain as the primary type of housing in the Bay Area through 2040.

C60-3: As required by CEQA, the EIR evaluated the impacts of the proposed Plan on biological resources. See Draft EIR Chapter 2.9 and Master Response A.3.

Letter C61 Eleanor S. Hansen (5/14/2013)

C61-1: MTC and ABAG believe the analysis of potential environmental impacts in the Draft EIR is thorough and adequate. As required by CEQA, this EIR evaluates the categories of potential impacts as reviewed through the public scoping process and presents mitigation measures to reduce identified impacts to the extent feasible. Chapters 1.1 of the Draft EIR also states that, "[f]or analytic purposes in this EIR, 2010 is the base year (existing conditions), except for greenhouse gas emissions where 2005 is the base year for one criterion to demonstrate compliance with SB 375. 2040 is the horizon year (future conditions) when it is assumed that the proposed Plan will be fully implemented."

C61-2: Every chapter of Part Two of the Draft EIR contains a summary of existing physical settings for the topic area. This provides the baseline of existing conditions for the EIR.

C61-3: Traffic impacts of the proposed plan are presented in Chapter 2.1, Transportation. The EIR presents analysis of projected traffic conditions after full implementation of the Plan in 2040,

and provides mitigation for related environmental effects on that time horizon. This approach is appropriate for a regional, program-level analysis. See Master Response A.3 regarding the level of specificity in the EIR.

- C61-4: The traffic impacts in Chapter 2.1 of the Draft EIR compare expected conditions under the proposed Plan in 2040, the year of the plan horizon, to existing conditions in 2010. As stated on page 2.1-1 of the Draft EIR, “Note that all of the existing conditions data for transportation reflects travel patterns and infrastructure for the baseline year of 2010. More information about the selection of this baseline analysis year is provided in Part 1 of this EIR.”
- Qualifying projects that use the CEQA streamlining provisions of SB 375 must apply all of the applicable and feasible mitigation measures in this EIR and will still need to obtain discretionary permits or other approvals from the lead agency and the local jurisdiction, in accordance with local codes and procedures, including any agreements related to zoning, design review, use permits, and other local code requirements. See Master Response A.2 for more information on CEQA streamlining.
- C61-5: CEQA requires the evaluation of a No Project alternative as it performs in the same horizon year as the proposed Plan, in this case 2040; this is the approach taken by this EIR. As page 1.1-9 of the Draft EIR states: “As with the evaluation of the proposed Plan, this EIR evaluates impacts of the No Project alternative and the other alternatives in 2040, the horizon year for the proposed Plan.” The Draft EIR does not substitute the No Project alternative for existing conditions. See response C61-1 regarding the 2010 base year for existing conditions.
- C61-6: The subjects listed are discussed in Chapters 2.1 through 2.14, Chapter 3.1, and Chapter 3.2 of the Draft EIR.
- C61-7: See responses C61-4, 5, and 6. The Draft EIR analyzed the Plan’s potential growth inducing impacts in Chapter 3.2. As Chapter 3.2 explains, the Plan provides a strategy to accommodate projected regional population growth but should not be considered growth-inducing.
- C61-8: This EIR evaluates Plan Bay Area as a single, regional project and assesses its impacts at a regional level across all nine counties, which is consistent with CEQA provisions regarding program EIRs. As stated in Chapter 2.0 of the Draft EIR, “as a program-level EIR individual project impacts are not addressed in detail; the focus of this analysis is to address the impacts which, individually or in the aggregate, may be regionally significant.” As a result, site specific impacts are properly not included; these would be analyzed and mitigated, if appropriate, by project-level environmental review. See Master Response A.2 for information on additional environmental review and A.3 regarding the level of specificity in the EIR. Also see response C61-4 regarding the baseline for the transportation analysis.
- C61-9: The proposed Plan includes relatively little roadway expansion, devoting just 5 percent of its available funds to do so (see Draft EIR, Table 1.2-10) while the regional population increases by 30 percent (Table 1.2-1). MTC and ABAG believe the traffic modeling and analysis in Chapter 2.1 are thorough and accurate. As discussed in Chapter 3.2, the Plan is designed to help local agencies accommodate regional population growth that will occur

with or without the Plan. The EIR discloses projected population growth, but the Plan is not growth inducing.

C61-10: CEQA streamlining under an SCS is a State mandate under SB 375 and beyond the authority of MTC and ABAG. See Master Response A.2 regarding CEQA streamlining.

C61-11: See responses C61-1 through C61-10.

Letter C62 Lorriana Leard (5/15/2013)

C62-1: As the comment notes, the Tam Valley is within a Priority Development Area—the Urbanized 101 Corridor. This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors. See Master Response I

This EIR evaluates Plan Bay Area as a single, regional project and assesses its impacts at a regional level across all nine counties, which is consistent with CEQA provisions regarding program EIRs. As stated in Chapter 2.0 of the Draft EIR, “as a program-level EIR individual project impacts are not addressed in detail; the focus of this analysis is to address the impacts which, individually or in the aggregate, may be regionally significant.” As a result, specific housing developments and site specific impacts such as on local roadways are not included in this EIR; these would be analyzed and mitigated, if appropriate, by project-level environmental review. See Master Response A.3 regarding the level of specificity in the EIR.

Letter C63 Jill Kai (5/15/2013)

C63-1: Your support for the No Project alternative is acknowledged. As the comment notes, Marinwood is within a Priority Development Area—the Urbanized 101 Corridor. This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors.

C63-2: The Draft EIR, on p. 1.2-49 and 50, notes that the proposed Plan allocates \$109 billion to highway and roadway projects. Overall, the Plan’s greatest emphasis is on “fix it first” projects, with 88 percent of funds going to transit and roadway operations and maintenance. “Compared to Transportation 2035, the proposed Plan Bay Area would spend a higher percentage of its budget on transit and roadway operations and maintenance, less on expansion of transit network, and roughly the same percent on road and bridge expansion.” In addition, as Table 1.2-10 of the Draft EIR shows, the proposed Plan will increase road and bridge operations and maintenance from 30 percent of the overall Transportation 2035 budget to 32 percent of the Plan Bay Area budget, an increase of \$28 billion (see updated numbers in Section 2.2 of this Final EIR); these funds are available due to a decrease in the proportion and amount of money to be spent on transit system expansion compared to the last RTP. In light of this transportation investment strategy, the proposed Plan clearly supports a continuation of personal automobile use. MTC must fund a transportation system that serves a growing population and many lifestyles while hitting targets assigned by the State, and this requires supporting transit as well as roadway systems. The proposed land

use pattern concentrates growth within transit-served locations, thereby lessening future growth and traffic pressures on rural roadways.

Letter C64 Justin Kai (5/15/2013)

C64-1: Your support for the No Project alternative is acknowledged. As the comment notes, Marinwood is within a Priority Development Area—the Urbanized 101 Corridor. This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors. See Master Response I.

C64-2: See response C49-8.

Letter C65 Libby Lucas (5/14/2013)

C65-1: For analysis of the regional biological impacts of the proposed Plan, including an analysis of the possible impacts on wetlands, please refer to Chapter 2.9, Biological Resources. Regarding the level of detail in the tables, this is a regional-scale program EIR which evaluates the proposed Plan’s impacts at that scale; see Master Response A.3 on the level of specificity required in a program EIR.

This EIR evaluates Plan Bay Area as a single, regional project and assesses its impacts at a regional level across all nine counties, which is consistent with CEQA provisions regarding program EIRs. As stated in Chapter 2.0 of the Draft EIR, “as a program-level EIR individual project impacts are not addressed in detail; the focus of this analysis is to address the impacts which, individually or in the aggregate, may be regionally significant.” As a result, site specific impacts such as along specific roadways and for particular wetlands are not included in this EIR; these would be analyzed and mitigated, if appropriate, by project-level environmental review. Only certain projects will qualify for CEQA streamlining (see Table 1.1-1 in the Draft EIR) and would be required to implement all of the applicable and feasible mitigation measures in this EIR, and still need to obtain discretionary permits or other approvals from the lead agency and the local jurisdiction, in accordance with local codes and procedures, including any agreements related to zoning, design review, use permits, and other local code requirements (p.1.1-13). See Master Response A.2 for detailed information on CEQA streamlining and additional environmental review. See Master Response A.3 regarding the level of specificity in the EIR.

C65-2: See response C65-1 regarding the regional nature of this EIR. When specific projects such as the I-280 ramp extensions mentioned in the comment move forward, geologic and other impacts will be evaluated at the project level.

C65-3: The analysis in Chapter 2.12 of the Draft EIR relied in part on the latest Urban Water Management Plan of the SFPUC, which indicated adequate water supplies through 2035. It is within the rights of a water supply agency to encourage or require water conservation. Please refer to Master Response G on water supply.

C65-4: Please refer to figure 2.8-3, which shows the latest FEMA 100-year floodplain maps. A discussion of sea level rise impacts can be found in EIR Chapter 2.5, Climate Change.

Letter C66 Patty Moore (5/15/2013)

- C66-1: Your support for the No Project alternative is acknowledged.
- C66-2: Please refer to Master Response C on requests for extensions of the public comment period.
- C66-3: Please refer to Master Response A.2 on CEQA streamlining. Your opposition to reduced parking requirements is acknowledged. The VMT tax concept is only included in Alternative 5, which was developed by environmental and equity stakeholders, as described in the Draft EIR, pages 3.1-7 and 8. The stakeholders sought to exempt low income residents from any future VMT tax in order to reduce the financial impact such a tax might have on low income residents. However, the modeling analysis was not able to exempt low income residents; therefore the analysis in the Draft EIR includes a VMT tax applied to all residents regardless of income level.

Letter C67 Hilary Mize (5/15/2013)

- C67-1: Your support for the No Project alternative is acknowledged. As the comment notes, Marinwood is within a Priority Development Area—the Urbanized 101 Corridor. This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. See Master Response I for additional information on the PDA process.
- C67-2: Please refer to Master Response D.2 on the connection between high-density housing near transit and reduced greenhouse gas emissions.

Letter C68 Ryan Mize (5/15/2013)

- C68-1: Your support for the No Project alternative is acknowledged. As the comment notes, Marinwood is within a Priority Development Area—the Urbanized 101 Corridor. This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. See Master Response I for additional information on the PDA process.
- C68-2: The Plan provides a strategy for accommodating projected regional population growth, in part by identifying higher density housing opportunities in transit-served locations. Potential emissions from all transportation modes are included in the modeling used in Chapters 2.2 (air quality) and 2.5 (GHG) of the Draft EIR. As the proposed Plan is a regional level plan, GHG analysis is done on a regional level, and county-specific analysis is not part of the regional-level EIR. See Master Response A.3 regarding the level of specificity of the EIR. See Master Response D.1 regarding the calculations in the SB 375 GHG analysis.

Letter C69 Paul and Elizabeth McDermott (5/16/2013)

- C69-1: The EIR for the proposed Plan is a programmatic document and evaluates impacts on a regional scale, covering impacts—including cumulative impacts—throughout the entire nine-county region of the Bay Area. See Master Response A.3 regarding the level of specificity of the EIR.

- C69-2: Chapter 2.13 of the Draft EIR evaluates potential impacts from hazardous materials and notes that projects are already required to comply with the Resource Conservation and Recovery Act, Title 22 of the California Code of Regulations, California Hazardous Waste Control Law, Cal/EPA requirements, HAZMAT training requirements, and any local regulations such as city or county Hazardous Materials Management Plans regulating the generation, transportation, treatment, storage, and disposal of hazardous materials and waste. Please refer to Master Response G for a description of the water supply analysis as conducted in the EIR.
- C69-3: For the analysis on these facilities, please refer to the EIR Chapter 2.12, Public Utilities and the mitigation measures proposed to reduce any potentially significant impacts on wastewater treatment and stormwater drainage facilities.

Letter C70 Joe McBride (5/15/2013)

- C70-1: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt. MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.
- C70-1.5: The EIR provides an open analysis of the proposed Plan and its environmental impacts, including those on public utilities and services; see Chapters 2.12 and 2.14 of the Draft EIR. Additionally, as shown in Chapter 3.1, the proposed Plan development pattern would only add around 500 more households to all of Marin County by 2040 compared to under the No Project alternative; much of the County's growth will occur regardless of the proposed Plan due to regional population and job growth.
- C70-2: The EIR is an environmental document that identifies potential environmental impacts and changes that could appear as a result of the proposed Plan. The proposed Plan is a regional-level Plan and therefore all analysis has been conducted on a regional scale; see Master Response A.3 regarding the specificity of a program EIR. For a detailed description of the water supply analysis as presented in the EIR, please refer to Master Response G on water supply. The Marin Municipal Water District's Urban Water Management Plan lays out the specific water-related adaptation and mitigation measures that plan for water infrastructure needs through 2035; these policies are solely at the discretion of MMWD and beyond the authority of MTC and ABAG.
- C70-3: See response C49-5, which describes how the forecast begins with jobs and therefore does not prioritize housing development over job creation. See Master Response D.2 for more information on the relationship between high density housing near transit and reduced greenhouse gas emissions. Chapter 2.5 of the Draft EIR analyzes whether the proposed Plan would attain the per capita GHG emissions reduction targets for cars and light trucks as required by SB 375 (it does) and also whether it would result in a net increase in direct and indirect GHG emissions in 2040 when compared to existing conditions (it does). Pages 2.5-55 and 56 of the Draft EIR show that overall GHG emissions from transportation would decrease under the proposed Plan.

C70-4: Please refer to Master Response D.2 on the connection between high-density housing near transit and reduced greenhouse gas emissions.

C70-5: See response C49-8.

C70-6: See response C49-9.

Letter C71 Jessica Middleton (5/16/2013)

C71-1: Commenter correctly summarizes the number of significant, irreversible environmental changes and significant unavoidable environmental impacts of the proposed Plan. The MTC Commission and ABAG Board will vote whether to approve the proposed Plan or on of the alternatives analyzed in the EIR in light of these findings.

C71-2: Please refer to Master Response G on water supply.

C71-3: For an analysis of the exposure to hazardous materials, please refer to the EIR Chapter 2.13, Hazards.

C71-4: For an analysis of the proposed Plan's impacts on wastewater treatment capacity, please refer to Draft EIR Chapter 2.12, Public Utilities.

C71-5: Please refer to the Draft EIR Chapter 2.2, Air Quality, for the proposed Plan's potential impacts related to toxic air contaminants and particulate matter.

C71-6: For a detailed description of the sea level rise analysis conducted in the Draft EIR, please refer to Chapter 2.5 as well as Master Response E on sea level rise.

C71-7: Please refer to the Draft EIR, Chapter 2.9, Biological Resources, for the full analysis of the proposed Plan's potential impacts on biological resources as well as mitigation measures to combat these potential impacts.

C71-8: Please refer to response C71-7.

C71-9: Commenter provides no specific examples of how the EIR is inadequate. Therefore, MTC and ABAG cannot meaningfully respond. However, MTC and ABAG disagree with the general assertion that the EIR fails to comply with the requirements of CEQA. See also Master Response B.1 regarding the population projections.

Letter C72 Michael Meyer (5/15/2013)

C72-1: Please refer to Master Response B.1 on population and job projections.

C72-2: Draft EIR Chapter 2.14, Public Utilities addresses the proposed Plan's potential impacts on water supply and wastewater resources. Additionally, please refer to Master Response G on water supply. Climate change impacts are analyzed in Chapter 2.5, including sea level rise, and also see Master Response E on sea level rise. In addition, flood hazards are addressed in the EIR in Chapter 2.8, Water Resources.

C72-3: The proposed Plan cannot "force" housing development anywhere; as noted repeatedly in the Draft EIR, MTC and ABAG do not have land use authority. See Master Response A.1

on local land use control. Local infrastructure capacity will be evaluated for individual land use plans and developments through project-level environmental review. All projects under the proposed Plan, including those qualifying for CEQA streamlining, will still be subject to regulations of local jurisdictions including permitting requirements and impact fees. The Draft EIR does evaluate public utilities and services at a regional level in Chapters 2.12 and 2.14.

C72-4: Commenter's support for the No Project alternative is acknowledged. Decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C73 Cindy Miracle (5/16/2013)

C73-1: Population growth is projected to occur regardless of implementation of the proposed Plan; Plan Bay Area is not advocating for this growth but rather attempting to mitigate its impacts. See Master Response B.1 regarding population projections. Draft EIR Chapter 2.12, Public Utilities, analyzes the potential impacts on water supply as a result of the proposed Plan and as discussed under Impact 2.12-1, the Urban Water Management Plans for the major water suppliers of the region indicate adequate water supplies for the amount of the region's projected growth, at a regional level. In addition, please refer to Master Response G on water supply.

C73-2: Please refer to response C73-1. In addition, the Urban Water Management Plans (UWMPs) for the major water suppliers of the region generally cover the period of time through 2035. The latest UWMPs indicate that, except for Solano County, adequate water supplies already exist through 2035 for an aggregate population greater than that accommodated by Plan Bay Area in 2040 (Draft EIR, pp.2.12-19 to 23). The UWMPs generally indicate few to no planned actions to undertake capital projects to acquire additional water supplies or storage; if they do, the water supplier would need to comply with CEQA before undertaking such capital projects.

C73-3: Please refer to response C73-1. The current MMWD Urban Water Management Plan indicates adequate water supplies through the year 2035 without a need to resort to desalination. In Marin County, the proposed Plan would result in essentially the same year 2040 population as under the No Project alternative - a three percent increase, with the proposed Plan resulting in 500 more households than under the No Project scenario. Given the ample water supplies indicated by MMWD, it is extremely unlikely that additional water supplies will need to be acquired due to growth under the proposed Plan. Furthermore, MMWD would need to comply with CEQA before undertaking future water supply projects. In addition, the decision to use desalination as a water source would be solely the decision of MMWD and is not advocated for or required by the proposed Plan. Moreover, in August of 2010, the District adopted Ordinance 420, which states that the District shall not approve construction, or financing for construction, of a desalination facility unless such construction is approved by a majority of District voters, voting in an election held within the District's service area for that purpose. It should also be noted that, as stated in *North Coast Rivers Alliance v. Marin Municipal Water District Board of Directors* (2013) 216 Cal.App.4th 614, the MMWD Board decided, as a matter of policy, even if a desalination plant is authorized by the voters in the future, MMWD will not develop a desalination plant unless all its electricity could be supplied from renewable sources. (*Id.* at p. 654.)

Contrary to commenter's assertion, the Draft EIR does not include a Statement of Overriding Considerations. However, CEQA does require that the MTC Commission and ABAG Board adopt a Statement of Overriding Considerations in the event they exercise their discretion to adopt the proposed Plan or any alternative thereto that has significant and unavoidable environmental impacts.

Letter C74 Pamela Macknight (5/14/2013)

C74-1: MTC and ABAG acknowledge that the EIR found 39 significant and unavoidable impacts, due to in part to the fact that SB 375 expressly does not provide MTC and ABAG with local land use authority. Therefore, MTC and ABAG cannot require local implementing agencies consider future land use projects to adopt the mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. Please see Master Response A.1 on local control over land use for additional information. To adopt the proposed Plan or an alternative analyzed in the EIR, the MTC Commission and ABAG Board would be required to adopt a Statement of Overriding Considerations as required by CEQA.

Letter C75 Paul D. Magginetti (5/16/2013)

C75-1: See pages 1.2-50 and 51 of the Draft EIR for a breakdown of how the anticipated revenues will be spent, and the updated numbers in Section 2 of this Final EIR. Plan Bay Area is a regional transportation plan which includes a proposed land development blueprint as required by SB 375; anticipated revenues are almost all earmarked for transportation expenditure. The main exception is the OBAG program, which provides grants to assist jurisdictions with planning efforts to implement the proposed Plan and livability initiatives. See Master Response F for details.

C75-2: Table 1.2-10 of the Draft EIR shows that 87percent of anticipated revenues would be spent on operations and maintenance, and the remainder on transit expansion (7%) and roadway expansion (5%). It is beyond the scope of an EIR to break down costs beyond those critical to the project description.

C75-3: Please refer to master response B.1 on population projections. Regarding your comment about transportation use expectations, Table 2.1-13 in the Draft EIR, p. 2.1-29, compares the typical weekday mode split for the region in 2010 and 2040. The table shows that 2.151 million typical weekday daily person trips would occur by transit in 2040 under the proposed Plan, seven percent of the regional total, up from five percent in 2010. It is not possible to ascertain the travel mode used specifically by the region's additional households in the future.

C75-4: The EIR examines multiple impact areas related to transportation, as summarized on page ES-9 of the Executive Summary, and as covered in Chapter 3.1 of the Draft EIR, pages 3.1-19 to 31. As noted by the Executive Summary, Alternative 3 has the least negative transportation impacts overall compared to the rest of the alternatives.

C75-5: The 66 dBA threshold is explained on p. 2.6-20 of the Draft EIR. Mitigation Measures 2.6(e), (f), and (g) would normally reduce impacts to a less-than-significant level, but as acknowledged on p. 2.6-34, "there may be instances in which site-specific or project-specific conditions preclude the reduction of all project impacts to less than significant levels, such as

where a new rail line or rail extension passes through a heavily developed residential neighborhood.” Local jurisdictions maintain all local land use authority, as explained in Master Response A.1, and have the ability to proscribe residential uses from an area due to noise and other concerns.

- C75-6: Please see Draft EIR, pp. 2.3-32 to 42, for an explanation of the analytic methods and criteria used to determine the likelihood of displacement or disruption resulting from land use and transportation projects. See also Master Response F regarding displacement. Since cities and counties retain their local land use authority, MTC and ABAG would not be able to proscribe development under the proposed Plan regardless of the significance of its impacts. See Master Response A.1 regarding local land use control.
- C75-7: Under CEQA, the conversion of any open space or farmland by a proposed plan is usually considered significant, which was the standard selected by MTC and ABAG after the receipt of public comments during the scoping process. No impacts are considered more or less important than others. EIRs are intended to provide for the public disclosure of potential environmental impacts to facilitate informed decision-making.
- C75-7.5: Population growth is anticipated to occur, as forecasted, regardless of whether Plan Bay Area is adopted. The proposed Plan represents an attempt to accommodate that growth and seeks to concentrate development in Priority Development Areas (PDAs) that were nominated by local jurisdictions. Neither MTC nor ABAG has the authority to change local zoning or to otherwise impose a particular type of development on a community. See Master Response A.1 regarding local control over land use under the proposed Plan and Master Response I regarding the PDA process.
- C75-8: The super majority discussion regarding Alternative 5 involved the feasibility of its use of a VMT tax, which may need approval from the State legislature. Nothing in the proposed Plan (Alternative 2) or the other alternatives would require such approval, only a majority vote by the MTC and the ABAG Board. An EIR must be performed and certified on a proposed plan or project prior to the decision to adopt it.
- C75-8.5: The comment asks about the “incentives” for implementation of changes to land use policy. The One Bay Area Grant program is a new grant program accounting for 4.9 percent of the total Plan funding. To be eligible for OBAG funding, jurisdictions must have current adopted housing elements and complete streets policies. OBAG is funded primarily through federal Surface Transportation Program and Congestion Mitigation and Air Quality funds, which are regional discretionary funds.
- C75-9: Under CEQA, a lead agency (here, MTC and ABAG) must balance the “economic, legal, social, technological, or other benefits” of a project against its unavoidable environmental risks. If the agency determines in its judgment that the project’s benefits outweigh its unavoidable environmental effects, the agency may approve the project, but must state in writing the reasons supporting its approval of the project based on the final EIR and/or other information in the record. (State CEQA Guidelines, Section 15093). Bay Area residents have an opportunity to give their input through the public participation processes required by CEQA, but the ultimate decision to approve the proposed Project or an alternative thereto rests with the elected officials from throughout the region who are on the MTC Commission and ABAG Board.

- C75-10: The Draft EIR, Chapter 2.13 (Hazards) evaluates the risk of locating projects on hazardous sites and recommends implementation of Mitigation Measure 2.13(d) to mitigate this risk (pp. 2.13-35 to 36). As this is a programmatic plan, site-specific analysis is not included in the EIR. See Master Response A.3 regarding program-level EIRs.
- C75-11: The requirement to prepare a regional transportation plan that includes a sustainable communities strategy arises under State law and there are no federal approvals that would necessitate NEPA review, so the preparation of this type of plan is subject only to CEQA. Future projects covered by the proposed Plan that receive federal funding or require federal permits may be required to undergo joint CEQA/NEPA review.
- C75-12: Per Mitigation Measure 2.11(a), structures more than 45 years of age would require, “an assessment by a qualified professional...to determine their eligibility for recognition under State, federal, or local historic preservation criteria.” As indicated in the measure, these historic preservation criteria vary by jurisdiction. However, the standards for a historical resources inventory are set forth in CEQA Guidelines Section 15064.5(b) and, when federal funding or permits are involved, Section 106 of the National Historic Preservation Act. Even though MTC and ABAG cannot require local compliance with Mitigation Measure 2.11(a), projects that seek to benefit from CEQA streamlining under SB 375 will have to implement that measure’s provisions.
- C75-13: Chapter 2.4 of the Draft EIR examines the energy impacts of the proposed Plan in depth, considering electricity, natural gas, gasoline, etc. The analysis looks at both direct and indirect energy use resulting from land use and transportation projects. The analysis concludes that implementation of the proposed Plan would lead to an overall 10 percent decrease in per capita energy use. No mitigation is needed to address this issue because the proposed Plan’s impact on energy consumption is less than significant. (See Draft EIR, Chapter 2.4 (Energy), p. 2.4-23.) The Draft EIR’s analysis does not consider phasing of improvements or interim stages of the proposed Plan because its purpose is to evaluate the Plan as a whole. (See Draft EIR, p. ES-8.) Site-specific infrastructure issues are beyond the scope of this EIR. Implementing agencies must comply with CEQA before adopting second-tier projects. See Master Response A.3 regarding the programmatic nature of this EIR.
- C75-14: The standards governing the construction and operation of natural gas pipeline infrastructure are beyond the scope of the proposed Plan and EIR. Please see Master Response A.3 regarding the scope of a program EIR. Public utilities must comply with CEQA as part of the CPUC permitting process for natural gas pipeline infrastructure.
- C75-15: The commenter misread the Draft EIR, which found no significant impact on exceeding wastewater treatment requirements of the RWQCBs. Page 2.12-58 explains that, “Existing and future land use plans, and development proposed under these plans, have been and will continue to undergo environmental assessment under CEQA that ensures that new development will not exceed a system’s ability to meet wastewater treatment requirements per the system’s NPDES permit.” It is reasonable for this EIR to assume that local jurisdictions will adhere to existing laws and regulations to which they are subject. Also, Plan Bay Area covers development through the year 2040, and it is reasonable to assume that wastewater treatment systems that fall out of RWQCB standards must eventually make improvements to meet them in order to continue operations. Local jurisdictions are under no compulsion to implement the development pattern in the proposed Plan, or may do so at

a later point in time after infrastructure has been improved; see Master Response A.1 regarding local land use control.

- C75-15.5: The comment asks if OBAG funds will be used to fund public utilities, specifically water infrastructure. OBAG funds consist of federal highway and transit funds from the Surface Transportation Program (STP) and Congestion Mitigation and Air Quality (CMAQ) Program. These funds cannot be used to fund public utility infrastructure.
- C75-16: The Draft EIR, Chapter 2.13 (Hazards), discusses the risk posed by hazardous materials and/or waste contaminating some parcels in the Bay Area, not all of which are located in Priority Development Areas (PDAs). To mitigate this impact, it recommends implementation of Mitigation Measure 2.13(d), which requires an evaluation of project sites, preparation of Phase I and Phase II ESAs, as appropriate, and implementation of any recommendations resulting from those ESAs. The measure requires compliance with ASTM standards to ensure that qualified personnel perform appropriate tests of soil, water, etc. See also Master Response A.1 regarding local control over land use. However, projects that wish to benefit from CEQA streamlining under SB 375 will have to implement this mitigation measure, if feasible.
- C75-17: Public services will need to be expanded in many locations to accommodate future growth. Note that the projected growth in the region will occur regardless of the proposed Plan, which only proposes a development pattern to accommodate the growth; see Master Response B.1 for more information on the growth projections. Public services are typically paid for and funded at the local level by a variety of methods, including impact and use fees and property and sales taxes; development under the proposed Plan would be subject to all such local regulations. Chapter 2.14 of the Draft EIR analyzes impacts on public services, finds potentially significant impacts, and proposes mitigation measures, which as noted on pages 2.14-14 and 16, must be implemented in order for a project to benefit from CEQA streamlining under SB 375. Mitigation Measures 2.14(a) and (b) require lead agencies to ensure that adequate public services, and related infrastructure and utilities, will be available to meet levels identified in applicable local plans prior to approval of new development projects. This requirement addresses Commenter's concern about proper phasing of infrastructure construction in relation to project construction. Development in PDAs will be subject to the same requirements regarding infrastructure provision as development outside of PDAs.

Letter C76 Krystal Macknight (5/15/2013)

- C76-1: Please refer to Master Response G on water supply. In addition, Chapter 2.14, Public Utilities, states the regional impacts on water supply and sanitation. Because the proposed Plan is a regional level plan, these impacts are evaluated on a regional scale. See Master Response A.3 regarding the programmatic nature of this EIR. That said, the Draft EIR used the latest planning documents from the Marin Municipal Water District and the wastewater treatment providers in Marin County; the commenter does not specify what is not realistic about the capacity numbers that came from these service providers.
- C76-2: Please refer to Chapter 2.5, Climate Change, for the impact analysis related to sea level rise and climate change and accompanying mitigation measures. Additionally, please refer to Master Response E on sea level rise.

C76-3: MTC and ABAG acknowledge that the EIR found 39 significant and unavoidable impacts, due in part to the fact that SB 375 expressly does not provide MTC and ABAG with local land use authority. Therefore, MTC and ABAG cannot require local implementing agencies consider future land use projects to adopt the mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. Please see Master Response A.1 on local control over land use for additional information. To adopt the proposed Plan or an alternative analyzed in the EIR, the MTC Commission and ABAG Board would be required to adopt a Statement of Overriding Considerations as required by CEQA.

Letter C77 Stephen Nestel (5/15/2013)

C77-1: Commenter's support for the No Project alternative is acknowledged. MTC and ABAG followed CEQA requirements for public noticing of the EIR. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

C77-1.3: Please refer to the Draft EIR Chapter 2.2, Air Quality, for the proposed Plan's potential impacts related to toxic air contaminants and particulate matter and mitigation measures.

C77-1.5: The EIR provides an open analysis of the proposed Plan and its environmental impacts, including those on public utilities and services; see Chapters 2.12 and 2.14 of the Draft EIR. Additionally, as shown in Chapter 3.1, the proposed Plan development pattern would only add around 500 more households to all of Marin County by 2040 compared to under the No Project alternative; much of the County's growth will occur regardless of the proposed Plan due to regional population and job growth.

C77-2: See response C49-5, which describes how the forecast begins with jobs and therefore does not prioritize housing development over job creation. See Master Response D.2 for more information on the relationship between high density housing near transit and reduced greenhouse gas emissions. Chapter 2.5 of the Draft EIR analyzes whether the proposed Plan would attain the GHG emissions reduction targets for cars and light trucks as required by SB 375 (it does) and also whether it would result in a net increase in direct and indirect GHG emissions in 2040 when compared to existing conditions (it does). Pages 2.5-55 and 56 show that overall GHG emissions from transportation would decrease under the proposed Plan.

C77-3: Please refer to Master Response D.2 on the connection between high-density housing near transit and reduced greenhouse gas emissions.

C77-4: Greenhouse gas emissions of the region's transit systems are included in the analysis of Impact 2.5-2 in Chapter 2.5 of the Draft EIR. Impacts have been assessed at a regional level and a conceptual localized level. County level information has been provided in the EIR when feasible, but does not represent an obligation to evaluate all impacts at that level.

C77-5: The SCS provides for low and moderate income homes by producing a land use pattern sufficient to accommodate RHNA and through ABAG's and MTC's efforts to support

additional affordable housing production. This includes Chapter 6 of the Plan, which identifies strategies for facilitating greater affordable housing preservation and production in the region. Many of these efforts require policy changes at the state or federal level that are beyond the control of the regional agencies, who will act as advocates for these changes. The regional agencies are providing more direct support for affordable housing through the Transit Oriented Affordable Housing (TOAH) fund, which supports affordable projects in Priority Development Areas and the identification of Affordable Housing as an allowable use for future Cap and Trade funds. Through these and other mechanisms, MTC and ABAG determined that of the 660,000 new housing units contemplated by the proposed Plan, 26 percent will be affordable to very low income households, 17 percent to low income households, 17 percent to moderate income households, and 39 percent to above moderate income households. (See Draft EIR, p. 1.2-53.) See also Master Response F, which addresses the issue of displacement in greater detail and identifies actions included in the Draft Plan to help address this challenge.

C77-6: See response C49-9.

C77-7: See responses C77-2 and C77-4.

Letter C78 Nancy Okada (5/16/2013)

C78-1: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C79 Joseph Orr (5/15/2013)

C79-1: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt. As the commenter notes, the Marinwood Area is within a Priority Development Area—the Urbanized 101 Corridor. This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors. See Master Response I regarding the PDA process.

C79-2: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

Letter C80 Lori Orr (5/15/2013)

C80-1: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt. As the commenter notes, the Marinwood Area is within a Priority Development Area—the Urbanized 101 Corridor. This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the

Draft Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors. See Master Response I regarding the PDA process.

- C80-2: Commenter does not provide any evidence that the data used in the proposed Plan and EIR are out of date or from non-neutral sources. MTC and ABAG disagree with this general assertion. MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR. In addition, potential impacts of the proposed Plan on schools are analyzed in Chapter 2.14 of the Draft EIR, Public Services. An evaluation of water infrastructure can be found in Chapter 2.12 of the Draft EIR, Public Utilities, and in addition please refer to Master Response G on water supply. Chapter 2.1 of the Draft EIR, Transportation, analyzes the regional impacts on highways and other major regional routes. For details on the population projections used for the Draft EIR, please refer to Master Response B.1 on population projections.
- C80-3: See Master Response B.1 on the population projections. The comment on “large high-density developments” is unclear—the proposed Plan does not specify the density or size of any individual projects; such developments may occur with or without the proposed Plan. However, it should be noted that the proposed Plan envisions limited development in Marin County, consistent with the existing scale of Marin’s communities.
- C80-4: Feasibility of the proposed Plan’s blueprint for growth was further tested by an assessment of a representative sample of PDAs from throughout the region by Economic and Planning Systems (EPS). Overall, the study concluded that the proposed development pattern contained in Plan Bay Area, while ambitious, represents an achievable level of growth with sufficient policy changes, some of which are now underway or currently being examined. See Master Response B.2 on feasibility of the PDAs.

Letter C81 Linda Rames (4/26/2013)

- C81-1: Water supplies are analyzed in Chapter 2.12 of the Draft EIR. As the proposed Plan is a regional level plan, all analysis in the EIR is done on the regional scale; see Master Response A.3 on the specificity of a program EIR. An evaluation of water resources specific to Marin County is therefore outside the scope of the EIR. Please refer to Master Response G on water supply. That said, the current MMWD Urban Water Management Plan indicates adequate water supplies through the year 2035. In Marin County, The proposed Plan would result in essentially the same year 2040 population as under the No Project alternative - a three percent increase, with the proposed Plan resulting in 500 more households than under the No Project scenario. Given the water supplies indicated by MMWD, it is unlikely that additional water supplies will need to be acquired due to growth under the proposed Plan.
- C81-2: Per the Marin Municipal Water District’s (MMWD) Urban Water Management Plan (UWMP) Section 3.3, the district has coordinated its future water demands through 2035 through the Sonoma County Water Agency (SCWA), and SCWA’s UWMP. Furthermore, the MMWD has a contracted volume of 14,300 acre-feet per year with SCWA; as of 2035, the MMWD anticipates needing no more than 8,500 acre-feet per year from this contracted volume. This issue was not raised in the Draft EIR for the reasons listed in response C81-1.

- C81-3: Please refer to response C81-1. These numbers come from MMWD's Urban Water Management Plan; the decrease in demand is likely due to Marin's low rate of growth combined with conservation programs.
- C81-4: This information comes from MMWD's Urban Water Management Plan. MTC and ABAG properly relied on the expert conclusions reached by MMWD regarding its projected future water supplies.
- C81-5: MTC and ABAG believe that the mitigation measure is adequate, especially in light of the water conservation targets set by the State under SB X7-7 and SB 610 and SB 221 which should ensure that an adequate water supply is available for large residential developments prior to their approval.
- C81-6: MTC and ABAG cannot locate the text quoted in this comment; it does not appear in the Draft EIR. The comment may be referring to the text that notes that despite Mitigation Measure 2.12(a), "MTC and ABAG cannot require local implementing agencies to adopt the above mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. Therefore it cannot be ensured that this mitigation measure would be implemented in all cases, and this impact remains significant and unavoidable." This statement is correct. See Master Response A.1 regarding local land use authority.
- C81-7: It would be speculative for the EIR to state that such capital projects would be needed and to know how they would be designed, implemented, and mitigated. Impact 2.12-4 finds this to be a potentially significant impact and proposes Mitigation Measures 2.12(a) through (h). See also Master Response A.3 regarding the programmatic nature of this EIR. CEQA does not require an evaluation of economic impacts; an analysis of the costs associated with water development is outside the scope of the EIR. Costs of water and wastewater utilities are typically borne by existing and new customers who cover the costs of service through utility rates and hookup fees.
- C81-8: The potential impacts of the proposed Plan on these areas are thoroughly evaluated in Chapter 2.14 of the Draft EIR, Public Services, at a level appropriate for a regional-level programmatic EIR. The chapter also provides mitigation measures to lessen possible impacts, but MTC and ABAG cannot require local implementing agencies to adopt the mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation for these potential impacts where necessary. Please see Master Response A.1 on local control over land use for additional information.
- C81-9: The Priority Development Area referenced in the comment—the Urbanized 101 Corridor in unincorporated Marin County—was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors. See Master Response I regarding the PDA process.
- C81-10: CEQA does not require an evaluation of economic impacts; an analysis of the costs associated with water development is outside the scope of the EIR. Local public services are typically funded by property and sales taxes and impact fees.

C81-11: Refer to the response C150-18 regarding the growth in traffic congestion under year 2040 Plan conditions. As indicated in that response, the growth in regional population and employment is the primary driver of increased traffic congestion. In fact, the transportation investments and land use strategy included in the proposed Plan reduce congestion compared to No Project conditions, as shown in Table 3.1-11. The proposed mitigations under Impact Area 2.1-3 would help to mitigate the growth in regional traffic congestion; however, the Draft EIR properly acknowledges that this impact is significant and unavoidable despite these mitigation measures.

C81-12: Mitigation measures are identified for all significant impacts, but many of the significant and unavoidable impacts identified occur because MTC and ABAG cannot require local implementing agencies to adopt the mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. See Master Response A.1 regarding local land use control. Many of the mitigation measures are considered industry best practices. MTC and ABAG believe all the mitigation measures proposed in the EIR are reasonable and implementable.

Letter C82 Jean Rieke (5/14/2013)

C82-1: Please refer to Master Response C on requests for extensions of the public comment period.

Letter C83 Pamela Sandu (5/12/2013)

C83-1: This comment is primarily focused on the transportation programs funded in the proposed Plan. The commenter notes that while there is some very effective transit service in the urban core, in the suburbs, the service is not effective. The commenter is critical of the amount of funds going to operate and maintain the existing system, stating that the systems need to provide more cost effective transportation options, and consider more innovative service delivery. MTC has a long-standing commitment to “fix it first”, which includes investing to maintain and operate the existing road and transit network. Within the general categories of transit capital or transit operating, transit agencies have a great deal of flexibility and autonomy regarding how those funds are spent and what service they provide. MTC recently completed the Transit Sustainability Project, which focused on improving the cost effectiveness and efficiency of the existing system, and considered alternative service delivery strategies. The project resulted in performance targets related to cost effectiveness and efficiency for the large transit operators in the region, as well as a new Transit Performance Initiative, which provides incentives and funding for projects that speed service and improve the customer experience.

C83-2: Recognizing the increasing demand for non-automobile modes given the region’s aging population, the proposed Plan expands existing public transit services and funds senior transportation programs across the region. As shown on page 2.1-27 of the Draft EIR, the proposed Plan expands transit seat-miles by 27 percent over the next three decades, providing additional fixed-route service that will make it easier for older residents to reduce their usage of automobiles. The proposed Plan also includes funding for a number of senior transportation programs designed to provide innovative transportation solutions. In addition to county-specific programs, a regional program administered by MTC (the Senior & Disabled Transportation Program – RTPID #230716) includes \$238 million in federal funding to address senior-specific mobility issues. This program has historically funded

flexible transportation options, such as shuttles and paratransit services, to serve the Bay Area's aging population.

Letter C84 Brad Sharp (5/15/2013)

- C84-1: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt. As the commenter notes, the Marinwood Area is within a Priority Development Area—the Urbanized 101 Corridor. This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors. See Master Response I regarding the PDA process.
- C84-2: See response C49-5, which describes how the forecast begins with jobs and therefore does not prioritize housing development over job creation. See Master Response D.2 for more information on the relationship between high density housing near transit and reduced greenhouse gas emissions.
- C84-3: See response C84-1. The proposed Plan does not specify the density or size of any individual projects; such developments may occur with or without the proposed Plan. See Master Response A.1 regarding local land use control. However, it should be noted that the proposed Plan does not anticipate high density development for Marin County.

Letter C85 Jim Shroyer (5/15/2013)

- C85-1: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.
- C85-2: Greenhouse gas data from 2005 is used because 2005 is the base year relative to which AB 32 requires future greenhouse gas emissions projections to be compared. This is noted on page 1.1-9 of the Draft EIR. See also Master Response D.1 regarding regional GHG emissions reductions for land use and transportation planning sectors under SB 375.
- C85-3: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.
- C85-4: See Master Response D.2 regarding the connection between high-density housing near transit and reduced GHG emissions,

Letter C86 Stephen F. Shank (5/13/2013)

- C86-1: The local traffic concerns identified by the commenter are noted. The proposed Plan is a long-term, regional-scale plan covering 101 cities and nine counties, over 150 major transportation projects, and many other transportation and land use projects over the next

approximately 28 years. Accordingly, the EIR analyzes the proposed Plan at a programmatic level. See Master Response A.3 regarding the programmatic nature of this EIR

- C86-2: The Draft EIR analyzes the capacity of wastewater facilities at a regional level in Chapter 2.12, Public Utilities. It remains the responsibility of local jurisdictions to assess infrastructure capacity for subsequent individual development projects that may follow this proposed Plan. See Master Response A.3 regarding the programmatic nature of this EIR.
- C86-3: Please refer to the Draft EIR Chapter 2.8, Water Resources, which evaluates the possible flood impacts as a result of the proposed Plan and provides mitigation measures for possible impacts. As stated in the Draft EIR on page 2.8-34, “any developments proposed within the 100-year flood zone would be required to meet local, State and federal flood control design requirements. In general, local jurisdictions have flood control policies that require new construction in flood-prone areas to be built to flood-safe standards, such as ensuring that ground levels of living spaces are elevated above anticipated flood elevations”. Therefore, if proposed development can meet these requirements then the potential impact related to flooding would be less than significant.

Letter C87 Toni Shroyer (5/6/2013)

- C87-1: For relevant impacts to public services, please refer to the Draft EIR Chapter 2.14, Public Services.
- C87-2: Development projects - even if using SB 375 CEQA streamlining benefits - must obtain discretionary permits or other approvals the local jurisdiction, in accordance with local codes and procedures, including any agreements related to impact fees.
- C87-3: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR. Commenter’s support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C88 Clayton Smith (5/16/2013)

- C88-1: The impact areas mentioned in the comment are analyzed in the Draft EIR at a level appropriate to the proposed Plan’s regional, programmatic nature. See Master Response A.3 regarding the programmatic nature of this EIR. Please refer to the Draft EIR, Chapter 2.14, Public Services, for an evaluation of the proposed Plan’s potential impacts on public services and the adequate accompanying mitigation measures. In addition, please refer to the Draft EIR, Chapter 2.12, Public Utilities, for the potential impacts and adequate mitigation measures. In addition, please refer to Master Response G for more information on water supply. Regarding population projections used, including a discussion of the Department of Finance projections versus those of ABAG, see Master Response B.1.

Letter C89 Barbara Snekkevik (5/15/2013)

- C89-1: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt. As the commenter notes, the Marinwood Area is within a Priority Development Area—the Urbanized 101 Corridor. This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors. See Master Response I regarding the PDA process.
- C89-2: See response C81-1. Please also refer to Master Response G on water supply for a detailed description of the water supply analysis as conducted in the EIR.
- C89-3: See response C89-1. The proposed Plan does not specify the density or size of any individual projects; such developments may occur with or without the proposed Plan. See Master Response A.1 regarding local land use control. However, it should be noted that the proposed Plan does not anticipate high density development for Marin County.

Letter C90 Elizabeth Specht (5/15/2013)

- C90-1: Please refer to Master Response G on water supply. In addition, the decision to use desalination as a water source would be solely the decision of MMWD and is not advocated for or required by the proposed Plan. The current MMWD Urban Water Management Plan indicates adequate water supplies through the year 2035 without a need to resort to desalination. In Marin County, the proposed Plan would result in essentially the same year 2040 population as under the No Project alternative - a three percent increase, with the proposed Plan resulting in 500 more households than under the No Project scenario. Given the ample water supplies indicated by MMWD, it is unlikely that additional water supplies will need to be acquired due to growth under the proposed Plan. Moreover, in August of 2010, the District adopted Ordinance 420, which states that the District shall not approve construction, or financing for construction, of a desalination facility unless such construction is approved by a majority of District voters, voting in an election held within the District's service area for that purpose.

Letter C91 Elizabeth Specht (5/15/2013)

- C91-1: Please refer to response C90-1.

Letter C92 John Stein (5/16/2013)

- C92-1: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.
- C92-1.5: Please refer to Master Response B.2 regarding feasibility of the proposed Plan's Priority Development Areas.

C92-2: Please refer to Master Response H for more information on the health impacts of emissions.

C92-3: The SCS provides for low and moderate income homes by producing a land use pattern sufficient to accommodate RHNA and through ABAG's and MTC's efforts to support additional affordable housing production. This includes Chapter 6 of the Plan, which identifies strategies for facilitating greater affordable housing preservation and production in the region. Many of these efforts require policy changes at the state or federal level that are beyond the control of the regional agencies, who will act as advocates for these changes. The regional agencies are providing more direct support for affordable housing through the Transit Oriented Affordable Housing (TOAH) fund, which supports affordable projects in Priority Development Areas and the identification of Affordable Housing as an allowable use for future Cap and Trade funds. Through these and other mechanisms, MTC and ABAG determined that of the 660,000 new housing units contemplated by the proposed Plan, 26 percent will be affordable to very low income households, 17 percent to low income households, 17 percent to moderate income households, and 39 percent to above moderate income households. (See Draft EIR, p. 1.2-53.) See also Master Response F, which addresses the issue of displacement in greater detail and identifies actions included in the Draft Plan to help address this challenge.

C92-4: See response C49-5, which describes how the forecast begins with jobs and therefore does not prioritize housing development over job creation. See Master Response D.2 for more information on the relationship between high density housing near transit and reduced greenhouse gas emissions.

The proposed Plan also includes policies that support telecommuting such as the 511 Rideshare program managed by MTC. The 511 Rideshare program encourages a menu of options for ways to reduce emissions and congestion, including carpooling, vanpooling, bicycling, transit, and telecommuting/tele-working. In order to make telecommuting a realistic option for commuters, the 511 Rideshare program works with employers to implement telework policies. The program conducts management surveys, analyzes management concerns and offers creative policy solutions, and even drafts policies for companies to implement. 511 Rideshare employer outreach staff also offer ideas on technologies to support telecommuting.

See also Master Response A.1 regarding local land use control.

Letter C93 Robin Stelling (5/16/2013)

C93-1: This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors.

C93-2: Please refer to Master Response B.1 on population projections.

C93-3: As the proposed Plan is a regional-level plan, all analysis has been conducted on a regional scale. See Master Response A.3 regarding the programmatic nature of this EIR. Water supply and sanitation information specific to Marin County can be found in the Marin Municipal Water District's Urban Water Management Plan, which specifies water demands through 2035. Please refer to Master Response G on water supply and Master Response E on sea

level rise. In addition, the EIR, Chapter 2.12, Public Utilities, evaluates the wastewater facilities of the Bay Area region and presents the potential impacts along with adequate mitigation measures.

- C93-4: By State and federal requirement, the RTP/SCS, also known as Plan Bay Area in the San Francisco Bay Area, must cover all nine Bay Area counties, including Marin. See also response C93-0.5.

Letter C94 Terry Stelling (5/16/2013)

- C94-1: For relevant impacts to public services, please refer to the Draft EIR Chapter 2.14, Public Services.
- C94-2: This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors. See Master Response I regarding the PDA process.
- C94-3: See Master Response B.1 regarding population projections. In Marin County, the proposed Plan would result in essentially the same year 2040 population as under the No Project alternative - a three percent increase, with the proposed Plan resulting in 500 more households than under the No Project scenario.
- C94-4: As the proposed Plan is a regional-level plan, all analysis has been conducted on a regional scale. See Master Response A.3 regarding the programmatic nature of this EIR. Water supply and sanitation information specific to Marin County can be found in the Marin Municipal Water District's Urban Water Management Plan, which specifies water demands through 2035. Please refer to Master Response G on water supply and Master Response E on sea level rise. In addition, the EIR, Chapter 2.12, Public Utilities, evaluates the wastewater facilities of the Bay Area region and presents the potential impacts along with adequate mitigation measures.
- C94-5: As no specific examples are provided regarding a lack of substantial evidence, MTC and ABAG cannot meaningfully comment. With regards to the level of analysis provided for Marin County, all counties are analyzed at a similar level of detail. This EIR evaluates Plan Bay Area as a single, regional project and assesses its impacts at a regional level across all nine counties, which is consistent with CEQA provisions regarding program EIRs. See Master Response A.3 regarding the programmatic nature of this EIR. The individual second tier projects envisioned by the proposed Plan - transportation improvements and land use development - must comply with CEQA.

Letter C95 Rachel Stengel (5/15/2013)

- C95-1: See responses to Letter C49.

Letter C96 Kerry Stoebner (5/14/2013)

- C96-1: See responses to Letter C73.

Letter C97 Carolyn Turner (5/7/2013)

- C97-1: This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors. See Master Response I regarding the PDA process.
- C97-2: The local traffic concerns identified by the commenter are noted. The proposed Plan is a long-term, regional-scale plan covering 101 cities and nine counties, over 150 major transportation projects, and many other transportation and land use projects over the next approximately 28 years. Accordingly, the EIR analyzes the proposed Plan at a programmatic level. See Master Response A.3 regarding the programmatic nature of this EIR.
- C97-3: See Master Responses D.1 and D.2 regarding the GHG emissions reductions conclusions reached in this EIR.
- C97-4: Please refer to Master Response G on water supply. In addition, the decision to use desalination as a water source would be solely the decision of MMWD and is not advocated for or required by the proposed Plan. The current MMWD Urban Water Management Plan indicates adequate water supplies through the year 2035 without a need to resort to desalination. In Marin County, the proposed Plan would result in essentially the same year 2040 population as under the No Project alternative - a three percent increase, with the proposed Plan resulting in 500 more households than under the No Project scenario. Given the ample water supplies indicated by MMWD, it is unlikely that additional water supplies will need to be acquired due to growth under the proposed Plan. Moreover, in August of 2010, the District adopted Ordinance 420, which states that the District shall not approve construction, or financing for construction, of a desalination facility unless such construction is approved by a majority of District voters, voting in an election held within the District's service area for that purpose.

Letter C98 Lisa Culbertson (5/15/2013)

- C98-1: Please see Master Response C regarding requests for extensions of the public comment period. MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.
- C98-2: See the Plan objectives adopted by MTC and ABAG on page 1.2-22 of the Draft EIR which generally do not include the items listed in the comment. See Chapters 2.3, 2.10, and 2.11 which analyze and mitigate the proposed Plan's potential significant impacts on land use, visual resources, and cultural resources issues, which overall cover the qualities of existing neighborhoods. All land development under the proposed Plan will be subject to local land use control, design guidelines, permits, impact fees, and all other regulations in force; see Master Response A.1 for more information on local land use control and Master Response A.2 on CEQA streamlining. Your opposition to the proposed Plan is acknowledged. As the comment notes, the Marinwood Area is within a Priority Development Area—the

Urbanized 101 Corridor. This PDA was nominated by the Marin County Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the proposed Plan. See Master Response I regarding PDAs.

C98-3: This comment addresses the relationship between the Plan's job growth projections and recent local trends and local growth projections, specifically for the county of Marin. The distribution of jobs in the Draft Plan takes into account a variety of factors—including input from jurisdictions, level of transit service, existing employment base, population growth, and concentration of knowledge-based economic activity. As such, the jobs distribution assumes that local conditions will change over the next three decades (e.g. market feasibility, changes in land use, etc.), and is not constrained by existing zoning or past trends.

More specifically, the overall regional employment forecast for 2040 is estimated as a share of the U.S. Bureau of Labor Statistics' national growth projections, reflecting the difference in 2010 between national and regional labor force participation in various economic sectors, such as the professional services and retail sectors. It is important to note that indicators suggest that the regional economy has been steadily recovering from the 2007-2009 recession.

At the county level, the distribution of 2040 employment among the nine counties for each industry sector is based upon county shares of regional employment in *Caltrans' California County-Level Economic Forecast: 2011-2040*. The distribution of employment by jurisdiction and Priority Development Area was then calculated as a share of county growth based on three basic approaches depending on the type of job: population-serving jobs, knowledge-sector jobs, and all other jobs. ABAG staff reviewed the employment figures for Marin County and considers the allocations appropriate given the level of population and housing growth anticipated in the county and the existing base of employment. This level of growth could be reasonably accommodated over the thirty-year time-frame of the Plan given the potential for changes in and intensification of land uses within the county.

The commenter also notes that the Plan should account for the level of in-commuters and transit in the overall distribution. Both the employment and housing distribution do account for levels of transit service in various locations and the level of in-commuting in various locations is factored into the housing distribution.

In summary, ABAG's regional forecast for employment for the county of Marin is accurate and supported by substantial evidence. See response C37-4, below and Master Response B.1 for more information on the regional forecast, and the *Draft Forecast of Employment, Population and Housing* for the Draft Plan for more information on the employment distribution methodology (http://onebayarea.org/pdf/Draft_Plan_Bay_Area/Draft_PBA_Forecast_of_Jobs_Population_and_Housing.pdf).

C98-4: The comment refers to the validity of the regional growth forecast, specifically the population and housing forecasts. ABAG's population and housing forecasts are accurate and supported by substantial evidence. Please refer to Master Response B.1 for more

information on the population forecast, including the differences between ABAG's and DOF's projections.

The commenter requests an assessment of impacts and costs for local services such as schools, police, fire, water, etc. In Chapter 2.14, the Draft EIR analyzes impacts to public services and facilities to the extent appropriate for a long-term regional land use and transportation plan. See Master Response A.3 for the level of specificity in the EIR. See Master Response G for more information on water supply.

The comment also refers to the types of housing anticipated in the Plan. The precise type and nature of housing developed in a given jurisdiction remains entirely under the local control of that jurisdiction (see Master Response A.1 regarding local control). More specifically, it is important to note that while the Plan does anticipate that nearly 80 percent of projected new housing will be built in the region's Priority Development Areas (PDAs), by 2040 the bulk of the region's total housing stock will still be provided by single-family homes even assuming modest production. Moreover, the PDAs are areas that have been identified and nominated by local jurisdictions throughout the region and each jurisdiction plans for the type of growth that their communities envision for these areas. As such, the PDAs comprise a wide range of place types that encompass the widely varying characteristics of communities across the Bay Area, from smaller, lower density transit neighborhoods and town centers, to medium-density suburban centers and mixed-use corridors, to larger urban neighborhoods and regional centers. Therefore, the plan does not make the assumption that all future housing preference is for high-density, mixed-use housing within urban areas; the Plan does, in fact, provide for a range of housing preferences and locations. See Master Response I regarding the PDA process.

Note that household and job growth expected for the region will occur regardless of the implementation of the proposed Plan, which seeks to mitigate the impacts of such growth on the regional transportation system while reducing greenhouse gas emissions. As shown in Table 3.1-3 of the Draft EIR (p. 3.1-14), the development pattern in the proposed Plan (Alternative 2) would result in 112,021 households in Marin County, in comparison to 111,509 households under the No Project alternative, and compared to 103,210 households in 2010. That is, without the adoption of the proposed Plan or any alternative, MTC and ABAG expect an additional 8,299 households in Marin between 2010 and 2040, an 8 percent increase, while under the proposed Plan, MTC and ABAG expect an additional 8,811 households in Marin by 2040, a 9 percent increase—and just 512 more households than under the No Project alternative.

Local public services are typically funded at the local level through property and sales taxes and impact fees. See Master Response A.1 for more information on local land use control. Utilities are typically funded by service and hookup fees which cover the cost of operations, as regulated by the California Public Utilities Commission. See Master Response H on UrbanSim modeling and subsidies.

As discussed on p. 2.3-5 of the Draft EIR, ABAG's projections anticipate a shift in the type of housing desired in the region, and note that multi-family and townhome units may be currently underrepresented relative to demand. The proposed Plan provides a broader array of housing options than currently exist. The region has a relatively small supply of multi-family units located near transit services, for example, and a relatively large supply of auto-

dependent single family homes. The proposed Plan's growth development pattern attempts to match housing development with demand trends by balancing options. In addition, the types of housing built will ultimately be determined by local jurisdictions and private developers.

C98-5: See Master Response D.2 on the connection between high-density housing near transit and reduced greenhouse gas emissions.

Regarding travel by car, the proposed Plan devotes a significant portion of its budget to operating and maintaining the existing roadway system. The Draft EIR, on p. 1.2-49, notes that the proposed Plan allocates over 79 percent of its budget to committed projects, which include many highway and roadway projects. Overall, 87 percent of total funds are going to operations and maintenance of the existing system: "Compared to Transportation 2035 [the current regional transportation plan], the proposed Plan Bay Area would spend a higher percentage of its budget on transit and roadway operations and maintenance, less on expansion of transit network, and roughly the same percent on road and bridge expansion."

In addition, as Table 1.2-10 of the Draft EIR shows, the proposed Plan will increase road and bridge operations and maintenance from 30 percent of the overall Transportation 2035 budget to 32 percent of the Plan Bay Area budget, an increase of \$28 billion (see updated numbers in Section 2.2 of this Final EIR); these funds are available due to a decrease in the proportion and amount of money to be spent on transit system expansion compared to the last RTP. In light of this transportation investment strategy, the proposed Plan clearly supports a continuation of personal automobile use. MTC must fund a transportation system that serves a growing population and many lifestyles while hitting targets assigned by the State, and this requires supporting transit as well as roadway systems. The proposed land use pattern attempts to concentrate growth within transit-served locations, thereby lessening future growth and traffic pressures on outlying roadways.

C98-6: As the comment notes, there are many ways to reduce GHG emissions. The strategies the comment mentions are all included in the proposed Plan. The comment notes vehicle technology and fuel efficiency, including incentives for individuals for the most fuel efficient cars, as an effective way to reduce GHG emissions. The Climate Program Initiative includes a vehicle buyback program and an incentive program focused on electric vehicles. In addition, the comment notes that creating more jobs in Marin County could reduce the need for people to commute into Marin County. Improving the jobs/housing balance is a key strategy of the proposed Plan, as noted by the *Jobs Housing Connection Strategy*, which was the land use strategy developed by ABAG that serves as the basis of the proposed land use. In addition, see Master Response D.2 on the connection between high-density housing near transit and reduced greenhouse gas emissions.

The comment criticizes the proposed Plan for not focusing on the benefits of new technologies in terms of reducing GHG emissions. One of the key objectives of Plan Bay Area is to reduce the GHG emissions as required by SB 375. SB 375 specifically requires MPOs to not include reductions that are the result of vehicle technology and fuel efficiency improvements in reaching the required GHG emission reduction targets. See Master Response D.1 for more information regarding SB 375 requirements.

The comment requests that a cost benefit analysis of the proposed Plan be done as it relates to overall GHG emission reduction estimates. The request will be considered by MTC and

ABAG; however, a cost benefit analysis is beyond the scope of an EIR. The proposed Plan does not intrude on basic economic and personal freedoms. See Master Response A.1 regarding local control.

Master Response D-2 addresses the relationship between public transit and greenhouse gas emissions; public transit has significantly lower GHG emissions per passenger-mile than automobile travel. The proposed Plan focuses on reducing passenger vehicle GHG emissions per the mandate of Senate Bill 375. That said, as transit vehicles are replaced over the life of the Plan, they will likely be succeeded by increasingly GHG-efficient vehicles (e.g. many local transit agencies are currently converting from older diesel buses to hybrid or natural gas buses).

- C98-7: See response B25-8 regarding the analysis of public health impacts of emissions. As a program Draft EIR, this document focuses on regional impacts of the transportation and land use strategy. Any project-specific traffic issues should instead be considered as part of local project analyses. Further information on the programmatic nature of this environmental document can be found on page 1.1-4; additional information regarding the Draft EIR's emphasis on regional impacts can be found on page 2.0-1 and see Master Response A.3 regarding the specificity of a program EIR.
- C98-8: See response C98-9 regarding regional traffic congestion impacts. As shown in Table 2.1-16, the proportion of trips at LOS F (where GHG emissions per mile would be greatest for automobiles) are still expected to be a minuscule proportion of overall VMT in year 2040 under the Proposed Plan. Any growth in GHG emissions from greater levels of travel in LOS F conditions are negated by mode shift to transit, reduced driving distances, and reduced travel at free-flow freeway speeds (more moderate speeds of approximately 45-55 mph are considered optimal for automobile GHG emissions). This leads to the forecasted reductions in per-capita GHG emissions as shown in Chapter 2.3.
- C98-9: The Draft EIR appropriately considers impacts to travel time under Impact Areas 2.1-1 and 2.1-2 (commute and non-commute travel times for all modes). Impact Area 2.1-2 specifically focuses on non-commute travel, which includes escort trips (e.g. transporting children to school or activities), shopping trips, and other discretionary travel. While per-capita congested VMT is expected to have a significant and unavoidable impact on the region's population (as shown under Impact Area 2.1-3), this is primarily due to the population and employment growth expected over the next three decades, rather than the transportation investments or land use pattern envisioned under the proposed Plan. Because residential and employment locations are shifted to be closer together under the proposed Plan, travel time impacts are expected to be less than significant, even as regional traffic congestion worsens.
- C98-10: See response C98-7 regarding the scale of analysis in this EIR. Localized impacts should instead be considered as part of local project analyses, including for PDA land use plans adopted by local jurisdictions.
- C98-11: See Master Response H on UrbanSim modeling and subsidies.
- C98-12: The EIR concludes certain environmental impacts will be significant; however, it should be noted that the Plan significantly reduces impacts when compared to the no project scenario. Whether such impacts are outweighed by the Plan's benefits will be considered by decision-makers prior to taking action on the Plan. In addition many of the significant and

unavoidable impacts occur because MTC and ABAG cannot require local implementing agencies to adopt the mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. Please see Master Response A.1 on local control over land use for additional information

C98-13: The MTC Commission and ABAG Executive Board are responsible for approving Plan Bay Area. Implementation of the Plan relies on voluntary actions by local jurisdictions and agencies to implement the programs and policies identified in the Plan. See Master Response A.1 regarding local control.

C98-14: See responses C98-1 through 13 above.

Letter C128 Kim Kurtzman Meehyun (5/15/2013)

C128-1: Commenter's opposition to the proposed Plan is noted. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Please see Master Response C regarding requests for extensions of the public comment period. MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

As the commenter notes, the Marinwood Area is within a Priority Development Area—the Urbanized 101 Corridor. This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the proposed Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors. See Master Response I regarding the PDA process.

- C128-2: See response C128-1.
- C128-3: See responses C49-3 and C49-4.
- C128-4: See response C49-5.
- C128-5: Any changes to zoning or land use must be made voluntarily at the local level. The proposed Plan does not override local land use authority, and MTC and ABAG have no local land use authority. All development under the proposed Plan will be subject to local jurisdictions' land use regulations and permit requirements, including zoning, design guidelines, and impact fees. See Master Response A.1 on local land use control.
- C128-6: See response C49-8.
- C128-7: See responses C128-1 through 6. See Master Response B.1 regarding population projections. Given the adequacy of the Draft EIR, MTC and ABAG will not be revising and recirculating it.

Letter C149 Luke Teyssier (5/16/2013)

- C149-1: See Master Response C regarding the request to extend the public comment period. MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR. The comment says that “significant and important facts and conclusions were misstated” but without further detail MTC and ABAG cannot respond to this statement.
- C149-2: Economic impacts are not an environmental issue area required under CEQA. Regarding the issue of the type of development leading to greater GHG emissions from commuting by construction workers, the proposed Plan accommodates housing for all economic segments of the population. See Master Response F. Furthermore, there is no reason to assume that local workers cannot be hired; one of the goals of the land development pattern proposed in the plan is to ensure that job growth is matched with nearby housing development. In addition, the permanent GHG reductions from constructing multi-family and transit-oriented housing mixed with employment uses will more than outweigh any temporary increases from construction workers commuting. Please refer to Master Response D.2 on the connection between high-density housing near transit and reduced GHG emissions.
- C149-3: See Master Response G regarding water supply analysis required of the regional scale program EIR. Impacts on biological resources including sensitive habitat are analyzed in Chapter 2.9, water resources in Chapter 2.8, and water supplies in Chapter 2.12 of the Draft EIR. These chapters note existing mandatory federal and State regulations that reduce these impacts, and provide additional mitigation measures required of any project wishing to take advantage of CEQA streamlining under SB 375; these additional measures may also be adopted and enforced by local jurisdictions although MTC and ABAG cannot compel them to do so. Development projects proposed within the region must comply with CEQA; where applicable, future project-level environmental analysis will evaluate and mitigate project-specific impacts relating to adequate water supplies or storm sewer infrastructure, and the potential for those issues to impact sensitive habitat, create significant traffic impacts, etc. See Master Response A.1 regarding local land use authority.
- The Draft EIR found in Chapter 2.12 that at a regional level there is adequate water supply through 2040 according to the Urban Water Management Plans of the region’s major water supply agencies. These agencies must comply with CEQA prior to approving future water supply projects; where applicable, the agencies will undertake environmental review of capital projects they propose to expand their water supply and must also undergo review and approval from the regional Water Quality Control Board and federal regulations before expanding their take of surface or groundwater.
- C149-4: The comment does not specify what the “flawed data” is and so MTC and ABAG cannot provide a specific response, only that the GHG emissions projections for the Draft EIR used VMT outputs from the MTC Travel Model and utilized the EMFAC2011 model created by CARB, which is the approach required by CARB to comply with SB 375. Also see response C149-6 below.

- C149-5: The Draft EIR, in Chapter 3.1, found that the No Project alternative would not meet the GHG emissions reductions mandate of SB 375, and therefore may not be selected as Plan Bay Area per State law to the extent a feasible alternative is available that is able to meet the GHG emissions reductions mandate of SB 375. Consistent with CEQA, SB 375, and related legal obligations, the decision-makers will consider the advantages and disadvantages of each alternative in determining which alternative to approve and may, in their discretion, modify the proposed Plan or an alternative identified in the EIR prior to taking final action approving one of them.
- C149-6: Per SB 375, MTC and ABAG are not permitted to take the regulations noted in the comment into account; see Master Response D.1 regarding GHG emissions included in analysis for the SB 375 target.
- C149-7: See the responses to the letter from the City of Sausalito, A16; the City did not challenge the projected jobs and housing in the Draft Plan. See Master Response B.1 regarding the growth projections and relationship with the DOF projections.
- C149-8: RHNA is a separate process from Plan Bay Area. See Master Response B.1 on the population projections for Plan Bay Area.
- C149-9: CEQA streamlining under certain conditions is State law as stipulated in SB 375 and beyond the authority of MTC and ABAG. See Master Responses A.1 regarding local control over land use and A.2 regarding CEQA streamlining. The environmental review process for the Sausalito Housing Element is beyond the scope of this EIR, which only pertains to Plan Bay Area.
- C149-10: See Master Response D.2 on the connection between high-density housing near transit and reduced GHG emissions.
- C149-11: Your support for the No Project alternative is acknowledged. Decision-makers will consider the advantages and disadvantages of each alternative in determining which alternative to approve.

Letter C150 Wendell Cox (5/13/2013)

- C150-1: The comment states that the Draft EIR is based on flawed data. See relevant responses below.
- C150-2: Under SB 375 the regional transportation plan must include a land development pattern (the sustainable communities strategy) and together these components must reduce per capita emissions from cars and light trucks to attain targets set by CARB if feasible; the Draft EIR found that the No Project alternative would not attain these targets and identifies other alternatives (including the proposed Plan) that would attain the targets for the region. See response C150-12 and others below. See Master Response D.1 regarding SB 375 targets.
- C150-3: The comment states that the Draft EIR should have included the effects of the latest federal light vehicle fuel economy standards. In fact, MTC and ABAG are not permitted to include these in attaining the CARB standard. See Master Response D.1 regarding the GHG analysis required as part of SB 375.

C150-4: The comment builds off of comment C150-3 and states that were the latest federal light vehicle fuel economy standards used, the No Project would have comfortably met the GHG emissions objectives and the proposed Plan would be unnecessary. As explained in Master Response D.1 regarding GHG analysis, fuel economy regulations per SB 375 and the CARB Scoping Plan cannot be counted towards meeting the MPO's GHG reduction targets. As demonstrated in Chapter 3.1 of the Draft EIR, the No Project alternative fails to meet the GHG reduction targets for both 2020 and 2035 established by CARB for the Bay Area.

In addition, while the SB 375 GHG target is a key objective of the proposed Plan, there are many other goals and targets the proposed Plan seeks to achieve. The Plan goals are outlined in the Draft EIR on page 1.2-21, and the performance targets are listed in the Draft EIR on page 1.2-22. A more extensive discussion of the policy targets developed by MTC and ABAG to guide the development of the Plan is included on pages 95 through 108 in the Draft Plan document.

C150-5: The comment criticizes the Draft EIR for not applying economic metrics to its GHG emissions reduction strategies. CEQA does not require that an EIR utilize economic metrics to evaluate GHG emissions reduction strategies. A cost benefit analysis was completed for large capital projects proposed for the Plan, as well as for the Climate Policy Initiatives, as noted later by the commenter in comment C150-16. Detailed information on that project assessment can be found in the Supplemental Report *Project Performance Assessment*.

When CARB developed the Scoping Plan, it considered how difficult it would be for various sectors to reduce GHG emissions and set the targets based on extensive analysis. This included consideration being given to the efficacy of regulations, technology, and planning and investments in reducing GHG emissions, including economic considerations. The SB 375 GHG emissions reduction targets set by CARB for MPOs to achieve through the Sustainable Communities Strategies were deemed by the State to be reasonable. Meeting the GHG emissions reduction target established by SB 375 and the CARB Scoping Plan is a State law. MPOs do not have the option of claiming that it is simply too expensive to reduce GHG emissions.

C150-6: The comment states that densification has failed to achieve objectives where tried. See Master Response D.2 regarding GHG emissions and densification/transit oriented development.

C150-7: Refer to response C150-17.

C150-8: Refer to response C150-18.

C150-9: The comment states that nearly all the transportation-related GHG emissions reductions are from fuel economy improvements. See Master Response D.1. State and federal regulations are an extremely effective way to reduce GHG emissions. It is much more difficult to reduce GHG emissions from transportation investments.

C150-10: Economic impacts are not environmental issues under CEQA. For more information on displacement and potential effects on low income populations, please see Master Response F.

C150-11: Refer to response C150-23.

C150-12: The comment claims that the Draft EIR substantially under-estimates 2040 GHG emissions reductions. See Master Response D.1 regarding what is included in GHG analysis for SB 375.

In addition, the comment claims that GHG reductions from Climate Policy Initiatives (Climate Initiatives) strategies are skewed to favor the proposed Plan, as compare to the No Project alternative. The No Project alternative does not include the full Climate Initiatives. The No Project alternative does not include new investments or programs, by definition. The Climate Initiatives are a new program, included for the first time in the proposed Plan. Therefore, the analysis is correct in not including the full GHG emissions reductions associated with the Climate Initiatives in the No Project analysis. The analysis, as noted on page 3.1-58 of the Draft EIR, *does* include in the No Project those projects included in the Climate Initiatives that expand on existing programs and policies (car sharing, vanpool incentives/employer shuttles, and the Commuter Benefits Ordinance). These projects were included to reflect the existing and ongoing benefits these programs provide.

The comment states that it is not clear that the Climate Initiatives would yield materially different results under the No Project alternative than under the proposed Plan. Including the full suite of Climate Initiatives projects in the No Project alternative is not consistent with the definition of a No Project alternative.

C150-13: See response C26-45.

C150-14: See Master Response B.1 for more information on the population projections used in the proposed Plan, including a discussion of the DOF estimates.

C150-15: The comment documents what the commenter believes the GHG emissions reductions should have been. As outlined in the responses above, the assumptions used to develop these revised figures are flawed. The analysis prepared by MTC and ABAG staff and expert consultants relied on in preparing this EIR constitutes reasonable GHG emission reduction forecasts consistent with applicable law and predicated upon facts and expert opinions.

C150-16: See response C150-5. In addition, it is true that there are other, less costly ways per ton to reduce GHG emissions than some of the transportation investments and Climate Initiatives strategies proposed in the proposed Plan. Many of those strategies, such as new technologies and regulations, cannot be included in the MPO's analyses of GHG reductions required to attain the SB 375 emissions reduction targets. See Master Response D.1 for more details on the GHG analysis for SB 375. See response C150-22 for information related to the cost metric of densification policies.

C150-17: The comment states that past efforts at densification have failed to achieve objectives. See Master Response D.2 regarding GHG emissions and densification/transit oriented development. In addition, the comment notes that 95 percent of the GHG emissions reductions in the proposed Plan that are attributed to land-use strategies are from energy efficiency and scooping measures, which would be achieved with or without the Proposed Plan. It is indeed true that the vast majority of overall GHG reductions in the region between 2010 and 2040 are attributable to regulations and energy efficiency improvements that are unrelated to the proposed Plan and not under the direct purview of MTC or ABAG. However, all GHG emissions reductions are important, so while land use changes in the

proposed Plan are not the primary source of reductions, they are an important piece of the puzzle and one that MTC and ABAG have a role in advancing.

C150-18: MTC recognizes that regional traffic volumes would increase under year 2040 Plan conditions compared to the year 2010 baseline. Note that the overall growth in traffic volumes (as measured by total VMT) is primarily due to increased levels of regional population and employment, rather than the specific transportation investments and land use decisions incorporated in this Plan. This is demonstrated by the relatively comparable levels of regional VMT between the proposed Plan and the No Project alternative, as shown in Table 3.1-8 of the Draft EIR.

Contrary to this commenter's assertions, the issue of traffic congestion is appropriately considered in the Draft EIR under Impact 2.1-3. Compared to the proposed Plan, per-capita daily VMT in congested conditions was 115 percent greater under the No Project alternative, as shown in Table 3.1-11. Additionally, the No Project alternative has 33 percent more hours of vehicle delay than the proposed Plan, as shown in Table 3.1-8. Contrary to the commenter's claim, the analysis indicates that higher-density development patterns combined with the proposed Plan's related transportation investments would lead to lower levels of traffic congestion.

While greater regional population and employment can be expected to increase traffic congestion, the focused land use development strategy actually mitigates some of the adverse effects of growth. Although year 2040 traffic congestion under the proposed Plan is expected to be worse than current conditions (thus it is recognized as a significant and unavoidable impact on page 2.1-34 of the Draft EIR), the proposed mitigation measures would help to minimize these impacts.

C150-19: The comment claims that MTC and ABAG ignore the impact of traffic congestion on GHG emissions. This is not accurate. As demonstrated in Figures 24 and 26 (pp. 59 and 61) in the *Draft Summary of Predicted Traveler Responses* supplementary report, MTC and ABAG expect congestion to increase between today and 2040. These congestion estimates were entered into the CARB emissions estimation software (EMFAC2011). As such, MTC and ABAG explicitly consider the increase in congestion on the proposed Plan's GHG estimates. MTC and ABAG also point the author of the comment to Figure 4 (pp. 21) of the *Draft Summary of Predicted Traveler Responses* supplementary report, which demonstrates the increase in roadway capacity in the proposed Plan relative to the No Project alternative.

C150-20: The comment claims that greater traffic congestion is likely to have negative health impacts due to air pollution. Chapter 2.2 of the Draft EIR analyzes this issue in depth and finds that the proposed Plan would have no significant impact in terms of criteria pollutant emissions (ROG, NO_x, CO, and PM_{2.5}) and regional toxic air contaminant emissions, but would have potentially significant impacts regarding construction-related emissions, increased emissions of PM₁₀ from on-road mobile sources compared to existing conditions, sensitive receptors located in TPP areas where the increased cancer risk is above the threshold and within set distances to mobile or stationary sources of TAC or PM_{2.5} emissions. See Chapter 2.2 for Mitigation Measures 2.2(a), (b), (c), and (d). See response B25-8 for more information on the emissions analysis and public health.

C150-21: Refer to the responses C172-18 and C153-9.

C150-22: Refer to response C150-10. Also, the commenter argues that the proposed Plan will negatively impact future housing affordability, the regional economy, and low-income households. The commenter follows this argument by asserting that the Plan has “potential detrimental effects on household affluence, especially on low income households” and that “these [effects] are not considered in the Plan Bay Area Draft EIR.”

Analysis of “household affluence” is not required under CEQA. If the commenter is alluding to the potential impact of a project or alternative on economic indicators such as income, CEQA does not require that these be quantified or analyzed. Similarly, CEQA does not require analysis of implicit or explicit policies in a project or alternative that could influence economic indicators, such as those the commenter argues are included in the Plan.

C150-23: This comment is primarily focused on the transportation investments of the Proposed Plan. It should be noted that the proposed Plan works to address mobility and affordability issues for households at all income levels. See Master Response F. The comment incorrectly conflates mobility for low-income households with automobile ownership – the proposed Plan instead improves mobility primarily by offering better public transit options (e.g., reducing travel times and improving service frequencies) and by bringing households and employment opportunities closer together. New and improved BART service, for example, provides a public transit option (featuring travel times competitive with highway travel) for travelers at all income levels. Similarly, new bus rapid transit lines throughout the region reduce travel times on highly-utilized urban bus lines often frequented by lower-income individuals. Greater proximity between residential and employment locations featured in the proposed Plan’s future land use pattern would also reduce commuting costs and travel times for people who own cars.

The proposed Plan already includes many of the commenter’s proposed strategies to improve mobility of individuals at all income levels:

- Expanded car-sharing programs are a key component of the Climate Initiatives Program as detailed on page 1.2-51 of the Draft EIR.
- The commuter benefit ordinance included as mitigation measure 2.1(b) would increase opportunities for telecommuting by encouraging employers to support alternatives to driving.
- Innovative strategies to specifically provide low-income individuals with improved mobility options are already funded as part of MTC’s Lifeline Program. The Lifeline Program is proposed for \$767 million in additional funding over the life of Plan Bay Area.

By arguing that no EIR alternatives addressed low-income mobility issues, the comment ignores the elements of the proposed Plan described above, as well as the inclusion of Alternative 5 (the Environment, Equity, and Jobs alternative) in the Draft EIR, which was specifically designed by social equity advocates to provide even greater mobility and affordability for low-income households than the proposed Plan. Rather than encourage automobile use, stakeholders instead sought to make more aggressive improvements to the regional transit system (beyond what is included in the proposed Plan). In summary, the Draft EIR thoroughly considered a wide array of transportation improvements benefitting Bay Area residents with a variety of income levels.

C150-24: Your support for the No Project alternative is acknowledged. Decision-makers will consider the advantages and disadvantages of each alternative in determining which alternative to approve.

Letter C151 Chris Engl (5/15/2013)

C151-1: There is ample evidence that transit-oriented development will reduce future GHG emissions, see Master Response D.2. In addition, the proposed Plan does not call for the elimination of or defunding of roads, and in fact devotes a significant portion of its budget to operating and maintaining the existing roadway system. The Draft EIR, on p. 1.2-49, notes that the proposed Plan allocates over 79 percent of its budget to committed projects, which include many highway and roadway projects, and the remaining discretionary funds are allocated mainly to “fix it first” projects with 87 percent of total Plan funds going to operations and maintenance. “Compared to Transportation 2035, the proposed Plan Bay Area would spend a higher percentage of its budget on transit and roadway operations and maintenance, less on expansion of transit network, and roughly the same percent on road and bridge expansion.”

In addition, as Table 1.2-10 of the Draft EIR shows, the proposed Plan will increase road and bridge operations and maintenance from 30 percent of the overall Transportation 2035 budget to 32 percent of the Plan Bay Area budget, an increase of \$28 billion (see updated numbers in Section 2.2 of this Final EIR); these funds are available due to a decrease in the proportion and amount of money to be spent on transit system expansion compared to the last RTP. In light of this transportation investment strategy, the proposed Plan clearly supports a continuation of personal automobile use. MTC must fund a transportation system that serves a growing population and many lifestyles while hitting targets assigned by the State, and this requires supporting transit as well as roadway systems. The proposed land use pattern attempts to concentrate growth within transit-served locations, thereby lessening future growth and traffic pressures on rural roadways.

C151-2: See Master Response C regarding requests to extend the public comment period. Additionally, MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR. Regarding your request to vote on the plan, The MTC and ABAG Board consist of elected representatives from many counties and cities of the region and their decisions reflect the decisions of these voter-selected officials.

C151-3: The Draft EIR, in Chapter 2.5, found that the proposed Plan would reduce GHG emissions per capita from cars and light trucks by 16 percent by 2035 and would not increase overall GHG emissions in 2040 despite a significant population and job increase.

C151-4: Commenter’s opposition to the proposed Plan is acknowledged. Decision-makers will consider the advantages and disadvantages of each alternative in determining which alternative to approve.

C151-5: The Plan is financially constrained and must be implemented within the expected revenues.

- C151-6: The Draft EIR, on p. 1.2-49, notes that the proposed Plan allocates over 79 percent of its budget to committed projects, which include many highway and roadway projects, and the remaining discretionary funds are allocated mainly to “fix it first” projects with 87 percent of total Plan funds going to operations and maintenance. “Compared to Transportation 2035, the proposed Plan Bay Area would spend a higher percentage of its budget on transit and roadway operations and maintenance, less on expansion of transit network, and roughly the same percent on road and bridge expansion.” In addition, as Table 1.2-10 of the Draft EIR shows, the proposed Plan will increase road and bridge operations and maintenance from 30 percent of the overall Transportation 2035 budget to 32 percent of the Plan Bay Area budget, an increase of \$28 billion (see updated numbers in Section 2.2 of this Final EIR); these funds are available due to a decrease in the proportion and amount of money to be spent on transit system expansion compared to the last RTP.
- C151-7: The project objectives for Plan Bay Area include increasing the local road pavement condition index (PCI) and decreasing the share of distressed lane-miles of state highways. The proposed Plan is expected to increase the PCI by 8 percent over existing conditions, compared to a 21 percent under the No Project alternative. However, the proposed Plan is expected to increase distressed highway lane-miles by 63 percent, the same amount as under the No Project alternative. Decision-makers will consider these and other advantages and disadvantages of the alternatives in determining which alternative to approve.
- C151-8: See responses C151-3, -5, -6, and -7 above.
- C151-9: The commenter raises no environmental issue to which a response is required under CEQA. The EIR is concerned with the impact of the proposed Plan on a set of environmental criteria, not the relative levels of funding versus other regions. See response C151-6.
- C151-10: The comment is related to past funding decisions by MTC to invest in fixed guideway transit rather than buses and does not raise an environmental issue to which a response is required.
- C151-11: See responses C151-3, -5, -6, and -7 above.
- C151-12: MTC has many responsibilities allocated to it from the State and federal governments and requested by its constituents, including the funding of transit operations.
- C151-13: These technologies are not allowed by SB 375 to be included in meeting the GHG emission reduction targets. See Master Response D.2 on calculations allowed by SB 375 to meeting the GHG targets.
- C151-14: The commenter asks why the proposed Plan does not treat funding from gasoline taxes and bridge tolls as user fees. This is not a comment on the Draft EIR. The expenditure of bridge tolls is largely determined by voter-approved regional measures that identified specific capital projects and operating uses for the bridge tolls.
- C151-15: See Table 1.2-2 on page 1.2-22 of the Draft EIR for the listing of the project objectives adopted by MTC and ABAG for Plan Bay Area.

C151-16: The commenter raises no environmental issue to which a response is required under CEQA. Furthermore, providing the MSC pricing analysis requested by the commenter would not affect the impact analyses in the EIR.

C151-17: The comment criticizes the use of “Anticipated/Unspecified” funding as a revenue source in the proposed Plan. This is not a comment on the EIR, but is instead a comment on the revenue forecast used for Plan Bay Area. As noted in the Supplemental Report *Financial Assumptions*, the inclusion of “Anticipated” revenues in the financially constrained plan strikes a balance between the past practice of only including specific revenue sources currently in existence or statutorily authorized, and the more flexible federal requirement of revenues that are “reasonably expected to be available” within the plan period. The comment criticized the fact that there is no forecast for where the funding is expected to come from. However, examples of past “anticipated/unspecified” revenues are included in the *Financial Assumptions* Supplemental Report.

MTC performed a retrospective analysis of projections for predecessor long-range plans, including a review of unexpected revenues that had come to the region but had not been anticipated or included in these projections. Over a 15-year analysis period, the San Francisco Bay Area received an annualized amount of roughly \$400 million (in 2011 dollars) from these “unanticipated” fund sources. These revenue sources include Traffic Congestion Relief Plan, Proposition 42, nonformula federal funds, Proposition 1B, and American Recovery and Reinvestment Act funding. For each fund source, only the amount distributed to the Bay Area was included. Based on this retrospective analysis, MTC believes it is reasonable to anticipate that additional revenues will become available to the region over the course of the Plan Bay Area period. MTC generated an estimate of these anticipated revenues by projecting the \$400 million figure forward at a 3 percent annual growth rate. To be conservative, these revenues are not assumed in the first five years of the plan.

C151-18: Providing a cost-benefit analysis is not a requirement of CEQA. An EIR is concerned with environmental impacts. The comment raises no environmental issue to which a response is required under CEQA. Decision-makers will consider the advantages and disadvantages of each alternative in determining which alternative to approve, in so doing the decision-makers may consider non-environmental issues including cost-benefit considerations.

C151-19: As the comment itself notes, telecommuting was included in the transportation modeling for the proposed Plan and each alternative. This was one of several trends included in the model that may increase or decrease future travel. Also see response C151-20.

C151-20: The comment criticizes the proposed Plan for not including an assumption that more people will telecommute. As shown in Figure 9 (pp. 39) in the Draft Summary of Predicted Traveler Responses supplementary report, the trend of workers working at home is approximately linear from 1980 to 2010. This linear trend does not align with, as the comment notes, the “parabolic decline in the price of computer, computer peripherals and the price of mobile devices.” This evidence suggests that telecommuting is not directly related to the price of these items. MTC and ABAG believe the telecommuting assumptions are reasonable and conservative (i.e., if telecommuting increases more than expected, the environmental impact of the plan would be reduced).

The comment questions why the Draft Plan does not include telecommuting policies and programs. Support for telecommuting is included in the 511 Rideshare program managed by

MTC. The 511 Rideshare program encourages a menu of options for ways to reduce emissions and congestion, including carpooling, vanpooling, bicycling, transit, and telecommuting/tele-working. In order to make telecommuting a realistic option for commuters, the 511 Rideshare program works with employers to implement telework policies. The program conducts management surveys, analyzes management concerns and offers creative policy solutions, and even drafts policies for companies to implement. 511 Rideshare employer outreach staff also offer ideas on technologies to support telecommuting.

C151-21: The No Project assumes expanded urban growth boundaries and it was found to not meet the SB 375-mandated GHG emissions reductions targets; see the Draft EIR, Chapter 3.1.

C151-22: This question is broad and unclear, and does not appear to be on the EIR.

C151-23: The comment raises no environmental issue to which a response is required under CEQA. CEQA does not require evaluation of financial issues, only environmental impacts.

C151-24: The comment questions if MTC and ABAG treated each of the alternatives objectively and fairly in terms of cost estimates, and what MTC and ABAG's track records are for cost estimates for past projects of large magnitude. All alternatives used the same financial cost assumptions. Project costs are submitted by the project sponsors. MTC, as the project sponsor of the Regional Express Lanes Network, has developed cost estimates for that project. However, that project has not yet been implemented, so an analysis of the accuracy of those cost estimates is not available.

C151-25: This question is beyond the scope of an EIR, which is intended to publicly disclose potential environmental impacts under a proposed Plan, propose mitigation measures that would reduce any identified impacts, and evaluate a range of feasible alternatives that also meet adopted objectives—the EIR is not required to evaluate all possible alternatives.

C151-26: This comment questions why the proposed Plan invests in new projects when maintenance of the existing system has an unfunded need. This is a comment on the Draft Plan, not on the environmental analysis of the Plan. The proposed Plan follows the long-standing Commission policy of “fix it first” and invests 87 percent of total revenue in operating and maintaining the existing road and transit system. While there is still a need for additional funding for maintenance of the local streets and roads and the transit capital, a small amount of funds were identified for roadway and highway expansion or transit expansion either by the counties as county priority projects or during the project performance assessment as strong performers. The vast majority of funds are still committed to operating and maintaining the existing system.

In addition, the comment questions investing in new transit project that will need to be subsidized in the future. Project sponsors, when developing their project costs, must include operating costs for the life of the Plan. For a project to be in the Plan it must be fully funded including capital and operating needs.

C151-27: The *Plan Bay Area Draft Performance Assessment Report*, published by MTC in March 2013, found that Alternative 5 generally performed the best of the scenarios—including the proposed Plan and the No Project alternative—against the project objectives adopted by MTC and ABAG.

C151-28: See responses C151-3, -5, -18, and -23.

Letter C152 Susan Kirsch (5/15/2013)

C152-1: Please see responses to the letters cited: Thomas Rubin – C166, Robert Silvestri – C26 and C156, Ann Spake – C155, Kerry Stoeber – C96, Linda Rames – C81, Liz Specht – C90 and C91, and Sharon Rushton – C33. Please refer to the other responses in this Final EIR as well.

C152-2: The NOP stated that, “The Jobs-Housing Connection alternative is the proposed Project,” on page 11. An NOP must identify the proposed project. Please see Chapter 1.2 of the Draft EIR for a description of the plan development process.

C152-3: The MTC and ABAG Board consist of elected representatives from many counties and cities of the region and their decisions reflect the decisions of these voter-selected officials.

C152-4: The issues cited relate to the Plan preparation process, not the EIR.

C152-5: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR. Also see Master Response C regarding the request to extend the public comment period.

CEQA does not require public hearings for an EIR; these were held as a courtesy for those wishing to submit their comments orally. The actions or inactions of individuals regarding their representation to MTC and ABAG are immaterial to the adequacy of the EIR.

C152-6: The failure of the proposed Plan to achieve this performance target is noted and will be taken into consideration by the MTC and ABAG prior to taking action on Plan Bay Area.

C152-7: The EIR proposes many feasible mitigation measures intended to mitigate significant impacts. Please see the Executive Summary of the Draft EIR, Table ES-2. However, MTC and ABAG cannot compel local governments to utilize these mitigation measures. Please also see Master Response A.2, which discusses further environmental review.

C152-8: MTC and ABAG may find that the proposed Plan would create significant environmental impacts, but that these impacts would be outweighed by other benefits, including having fewer impacts than under the No Project alternative. The Findings and Facts in Support of Findings and a Statement of Overriding Considerations will accompany the Final EIR when MTC and ABAG review it for certification.

C152-9: The Draft EIR, in Chapter 3.1, found that the No Project alternative resulted in the greatest adverse environmental impacts and would likely create five significant and unavoidable impacts in addition to those under the proposed Plan. Also, the No Project alternative would not attain the GHG emissions reductions targets established by ARB and therefore may not be selected according to SB 375.

C152-10: See response C152-5.

- C152-11: See response C152-3.
- C152-12: The Draft EIR includes a list of preparers in Chapter 4.
- C152-13: These comments are not on the EIR and do not raise environmental issues under CEQA. That said, MTC and ABAG are unaware of any efforts to merge counties and/or public services and that concept is not raised in SB 375.

Letter C153 Randal O'Toole (5/15/2013)

- C153-1: This characterization of the proposed Plan is incorrect. The proposed Plan does not assume or advocate for the demolition of single-family homes or any other housing units. The EIR, in the table cited, is simply presented the results of background research conducted for ABAG on the Jobs-Housing Connection Strategy. In fact, on the same page of the Draft EIR cited, p. 2.3-5, it states that, "The projected oversupply of single-family homes is expected to reduce demand for other housing types by almost 170,000 units as some households that would otherwise choose multifamily units instead opt for single family homes made more affordable due to excess supply." In other words, the expected oversupply of single-family houses relative to demand, estimated to be an excess of 160,000 units, would result in lower production of multi-family units than would otherwise occur because that demand would be satisfied with existing single-family housing stock. The same page of the Draft EIR also notes that, "Although this suggests no demand for newly constructed single-family homes, some production will likely occur as the Bay Area housing market adjusts to these trends."
- C153-2: As Table 2.3-2 on p. 2.3-5 of the Draft EIR shows, single-family detached homes are expected to still be the housing type most in demand. As of 2010 just over half (56%) of housing in the Bay Area is single-family detached homes. Looking ahead, ABAG's economists expect that the demand for single family homes is expected to decline. See Appendix D of ABAG's Jobs-Housing Connection Strategy, May 2012, for an explanation of factors expected to reduce single-family home demand in the Bay Area, including lingering effects of the housing bubble, tightening credit standards, lower median household incomes, energy costs, changing rates of marriage, and changes in household size and composition. These factors apply to this region alone and are not a statement on the popularity of single-family homes in the remainder of the country.
- C153-3: See Draft EIR Chapter 3 for a detailed comparison of the Alternatives. MTC and ABAG will consider the benefits and feasibility of the alternatives before reaching a decision. The decision to approve a project will be supported by findings regarding the various alternatives.
- C153-4: This comment questions the assumptions about transit ridership. See Master Response D.2 on the connection between high-density housing near transit and reduced GHG emissions.
- C153-5: See Master Response F regarding displacement and Master Response D.2 regarding SB 375's GHG emissions reductions requirements.
- C153-6: This comment does not raise an environmental issue to which a response is required.
- C153-7: The vetting process for the alternatives is explained in Chapter 3.1; it was wholly consistent with CEQA. These alternatives were selected among a broader range considered as those

that would feasibly attain most of the basic objectives of the proposed Plan and, in some instances, potentially avoid or substantially lessen the environmental consequences attributed to the proposed Plan. Cost-effectiveness, tradeoffs and preferences are all factors that decision-makers will consider after EIR certification when they determine what actions to take on the proposed Project. Your comments on the proposed Plan, the alternatives and the planning process are acknowledged and will be considered as part of the decision-making process.

C153-8: Your comments on the proposed Plan and potential socio-economic effects are acknowledged. They do not relate to the EIR, which provides environmental review of the Plan.

C153-9: This comment argues that per-capita transit ridership has declined even as the region has invested into transit expansion projects – therefore asserting that the forecasted per-capita transit ridership growth is unrealistic. While regional transit ridership has grown over time as shown in Table 2.1-6 of the Draft EIR, the share of Bay Area residents commuting by transit has remained steady over the past two decades despite significant transit investments such as BART extensions to Millbrae, Pittsburg, and Dublin/Pleasanton. This is primarily due to land use factors rather than inherent personal preferences for automobile travel.

Two land use trends have made it difficult to expand the transit mode share (or grow per-capita transit ridership) – residential sprawl and job sprawl. First, much of the region’s residential development since the mid-20th century has been occurring in edge suburbs and exurbs due to higher development costs in the existing urban core. These low-density areas are generally dependent on the automobile and difficult to serve with public transit. Second, regional employment has become increasingly dispersed with employers moving from city centers to suburban office parks. These dispersed locations are equally difficult to serve by public transit as they lack the concentration of jobs found in dense transit-oriented city centers such as San Francisco’s Financial District.

The proposed Plan leads to growth in per-capita transit ridership not only by investing in public transit but also by emphasizing a highly focused land use pattern for both residential and employment growth. By channeling growth into Priority Development Areas with high-frequency transit services, the proposed Plan aims to reverse historical auto-oriented land use development patterns in lieu of focused development more efficiently served by public transit. See Master Response D.2.

C153-10: The No Project alternative does assume an expansion of the “urban footprint” based on historical trends. An expansion of the roadway network is not a feasible alternative because funding for substantial improvements to the highway system, such as added lanes and new freeways and arterials, is simply not available from the federal or State governments. Historically, federal funding assumed up to 90 percent of the costs of highway improvements, but this level of funding for new highway projects is simply not available. Currently, only about 12 percent of the funding for State Highways in California comes from the federal government. MTC and ABAG do not expect to see a substantial increase in this amount anytime soon. About double that amount comes from State funding. The rest comes from local sources. In the Bay Area, the primary source of transportation funding comes from sales tax measures and bridge tolls. Overall, transportation needs for the future are under-funded at well below 50 percent. As a consequence, MTC has been developing and implementing a “fix it first” policy to address deteriorating infrastructure. Where local sales

tax measures have been used to support highway projects, that funding has been largely expended, and there are no unallocated revenues. Finally, on the question about expanded bus service, MTC and ABAG note that Alternative 3, Transit Priority Focus, includes increased AC Transit service, not just BART, and Alternative 5 included a significant increase in bus service, both local and TransBay.

- C153-11: This EIR does include an extensive and complete analysis of each of the proposed Plan's components (its policies) on GHG emissions; see Chapter 2.5. Costs and housing affordability, however, are not environmental effects and so are not subject to review under CEQA.
- C153-12: As explained in response C153-10, the alternatives were derived from a rigorous vetting processing (see "Alternatives Screening" on pg. 3.1-2). This was not done by compiling policies in a random fashion, but instead reflected a systematic assessment with an open public review and comment process. Stakeholders contributed to the formulation of alternatives, as explained in the Draft EIR.
- C153-13: Your comments about the alternatives presented in the three bullets are correct. Your comments about the perceived bias towards density concerns the substance of the proposed Plan and raises no environmental issue to which a response is required under CEQA
- C153-14: This comment is not correct, as previously explained in Response C153-1. This EIR does not state that there will be any demolition of single-family homes; it simply reports the results of a supply and demand analysis conducted for ABAG as part of the background research underpinning the proposed Plan.
- C153-15: MTC and ABAG acknowledge these comments regarding the proportion of multi-family and single family housing units in the Draft Plan, as well as future affordability and the merits of specific research noted in the Draft Plan. MTC and ABAG took multiple sources of research into account in developing the housing distribution in the proposed Plan. See Master Response F.
- C153-16: See response C153-15.
- C153-17: See responses C26-43 and C26-45.
- C153-18: MTC and ABAG have reviewed and understand the literature, but have come to different conclusions. Under CEQA and California case law, it is recognized that experts may disagree, and such disagreement does not render an EIR invalid. For information on the literature MTC and ABAG have reviewed, see Master Response D.2, Connection between High Density Housing near Transit and GHG emissions.
- C153-19: The first part of this comment deals primarily with the funding allocations of the proposed Plan itself, rather than the EIR analysis. In order to maximize mode shift to transit, a greater proportion of funding in the proposed Plan is allocated to expanding, operating, and maintaining the region's transit system. As shown in Table 2.1-13, this is forecasted to lead to significant growth in transit ridership over the lifespan of the Plan. In contrast to the commenter's assertion that mode shift to transit will not lead to forecasted reductions in greenhouse gas emissions, Master Response D.2 provides significant evidence that supports

the benefits of transit mode shifts for GHG reduction. Refer to response C153-9 on the issue of forecasted per-capita transit ridership growth.

- C153-20: The comment cites statistics showing that the energy consumption of an average automobile is similar to the energy consumption of average public transportation service when measured per passenger mile. However, the comment fails to acknowledge the differential impact of adding travelers to automobiles versus adding passengers to public transportation service. As more and more travelers use the Bay Area's transportation system, adding travelers to existing public transportation is less energy intensive than adding travelers to private automobiles because the existing transit system has far greater publically available capacity than existing private automobiles. Implicitly, the comment suggests that MTC and ABAG should strive to capitalize on the region's sunk investment in public transportation infrastructure by designing policies to increase ridership on existing service, thus reducing public transportation's energy consumption on a per passenger mile basis. MTC and ABAG agree and the proposed Plan attempts to do just this via focused land use planning. Master Response D.2 provides additional information about the relative GHG intensity of automobile modes in comparison to public transit – which contradict this comment's assertion that automobiles and public transit have equivalent levels of Carbon intensity.
- C153-21: Please see response C153-20. This comment also seems to ignore the fact that the Bay Area's primary rail system, BART, runs on electricity.
- C153-22: See Master Responses D.1 and D.2.
- C153-23: The comment raises no environmental issue to which a response is required under CEQA.
- C153-24: The source or methods used to compute the numbers in Table One are not identified. The results, therefore, are speculative. MTC and ABAG remind the author of the comment that reducing GHG emissions is only one of many objectives of Plan Bay Area, and that the goal of addressing greenhouse gas emissions through land use and transportation planning is MTC and ABAG's directive under SB 375. See Master Response D.2.
- C153-25: Refer to comment responses C153-9 and C153-19 on the issue of per-capita transit ridership forecasts.
- C153-26: MTC and ABAG expect that concentrating growth will increase localized traffic congestion, as stated in the comment, but on net reduce emissions as automobile trip lengths can be reduced (by bringing activities closer together) and alternative transportation modes, including walking, are more likely. SB 375 directs MTC and ABAG to reduce emissions from automobiles and light-duty trucks. Please refer to the Chapter 3.1 of the Draft EIR, Table 3.1-11: Per-Capita Daily Vehicle Miles of Travel by Level of Service (2010-2040), which shows lower levels of congestion across all V/C ratio ranges and time periods for the proposed Plan compared to the No Project alternative.
- C153-27: This comment is not correct; Table 3.1-28 properly excludes Pavley reductions from the per capita analysis for Criterion 1 under the Thresholds of Significance for Climate Change and GHG impacts presented in Chapter 2.5 because that exclusion is required by SB 375. See Master Response D.1.
- C153-28: See Master Response F regarding displacement.

- C153-29: See response C153-28.
- C153-30: Under SB 375 the proposed Plan must demonstrate the capacity to construct enough housing units to accommodate the project population; this is a statutory requirement. The comments on open space refer to the objectives of the Plan, not the adequacy of the EIR. Also see Master Response F regarding displacement.
- C153-31: These comments regard localized and specific impacts of land development design on crime prevention. This is a project-level issue and should be evaluated in project-level environmental review and/or local discretionary review; see Master Response A.3 regarding analysis required in a program EIR. All development under the proposed Plan is subject to local permitting, design guidelines, impact fees for public safety, and other land use controls; see Master Response A.1 regarding local land use control
- C153-32: The comment raises no environmental issue to which a response is required under CEQA.
- C153-33: The observation about the GHG analysis is not correct; this EIR does not ignore State law that mandated improvements in fuel efficiency. This mandate is fully analyzed in Chapter 2.5, Climate Change and Greenhouse Gas Emissions. In fact, tables showing projected emissions distinguish GHG reductions related to the proposed Plan from reductions attributable to Pavley regulations and the Low Carbon Fuel Standard.
- C153-34: The comment raises no environmental issue to which a response is required under CEQA.

Letter C154 Linda Pfeifer (5/15/2013)

- C154-1: See response C149-3.
- C154-2: See responses C149-5 and C149-6.
- C154-3: See responses C149-7 and C149-8.
- C154-4: See response C149-9.
- C154-5: See Master Response D.2 on the connection between high-density housing near transit and reduced GHG emissions.
- C154-6: Your support for the No Project alternative is acknowledged.

Letter C155 Ann Fromer Spake (5/15/2013)

- C155-1: MTC and ABAG believe that this EIR, as a programmatic assessment of environmental consequences and summary of mitigation measures that can reduce or eliminate adverse impacts, does in fact conform to CEQA requirements and provides a valid, legal basis for decision-making by both agencies and, after certification, by responsible agencies and local agencies undertaking projects supported and/or funded by the proposed Plan. Impacts are assessed at a level appropriate to this regional-scale, programmatic Plan and EIR. Mitigation measures are included for all significant impacts, though MTC and ABAG cannot compel local jurisdictions to adopt them. See Master Response A.2 for additional information on

CEQA streamlining options. Also see Master Response A.3 on the requirements for a program EIR.

- C155-2: Highways are shown in their correct geographic location and alignment, and the information presented in tables and text is valid and correlated with the geographic information. With this in mind, this Draft EIR does, in fact, adequately disclose, analyze and mitigate potentially significant health effects. Peer review by responsible agencies confirms this. The U.S. Environmental Protection Agency, in their letter (see Letter A21 for details) commends MTC and ABAG for the Local Pollutant Impact Analysis and supports inclusion of the mitigation measures for localized impacts. See also response to comment B25-8.
- C155-3: MTC and ABAG may find that the proposed Plan would create significant environmental impacts, but that these impacts would be outweighed by other benefits, including having fewer impacts than under a No Project scenario. In addition many of the significant and unavoidable impacts occur because MTC and ABAG cannot require local implementing agencies to adopt the mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. Please see Master Response A.1 on local control over land use for additional information. This issue will be also addressed in the Statement of Overriding Considerations that accompanies the Final EIR when submitted to the MTC and ABAG Board for certification.
- C155-4: The Draft EIR does include substantial evidence in each chapter, supporting the impact analysis, and fully describes the mitigation measures so they can be evaluated as to their merit. On the question of sea level rise, MTC and ABAG are currently working with federal, State and regional agencies on project-level vulnerability and risk assessment. This is an ongoing process, supported and continuing under the proposed Plan. This clearly is evidence of taking responsibility for implementation, not deferring action. This is not *post hoc* rationalization. Enforcement responsibility that would rest with local governments and the land use authority they retain under the proposed Plan would not change, so responsibility for enforcing risk mitigation measures would devolve to these jurisdictions under the mitigation measures proposed for the criterion used for the sea level rise analysis; see Master Response A.1 regarding local land use control.
- State agencies responsibilities for sea level rise planning and adaptation was set in place in Executive Order S-13-08, and the proposed Plan would not change that obligation. The proposed Plan will ask implementing agencies to require project sponsors to incorporate appropriate adaptation strategies into local transportation and land use projects. MTC and ABAG also will be formulating regional guidance to facilitate implementation of a regional sea level rise adaptation strategy. However, because MTC and ABAG cannot compel local agencies to adopt the mitigation measures listed in all cases, this impact remains significant, and this conclusion is highlighted for decision-makers in the Executive Summary. The analysis and disclosure is not deferred, and known mitigation measures are fully described. Moreover, the EIR includes specific information as to which transportation projects are potentially affected by sea level rise, so local planners do have a factual basis for determining the scope of any subsequent project-level environmental review. See Master Response E for additional information on sea level rise.
- C155-5: The interrelationships between the proposed Plan and its environmental setting is included in each of the chapters so there is, in fact, a context created for the impact analysis. The effects of sea level rise on a transportation project and land development are described,

quantified and summarized, not ignored, as the responder suggests. Similarly, exposure to seismic risk is described, quantified and summarized, including the people who would be affected. These pre-existing hazards are part of the baseline conditions, and this information is presented in the Draft EIR, Chapter 2.7.

- C155-6: The comment mischaracterizes the CEQA streamlining rules and procedures created by SB 375. For additional information see Master Response A.2.
- C155-7: PDAs are nominated by local jurisdictions. In the case of the Highway 101 urban corridor, the PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors. See Master Response I regarding the PDA process.
- C155-8: As a programmatic assessment, this EIR examines effects on the mainline highway system and major transportation corridors. The concern expressed about localized transportation impacts is legitimate and certainly warrants further analysis and consideration as part of project-specific implementation of Plan Bay Area as well as local General Plans and Housing Elements. No further analysis is required in this Programmatic EIR. See Master Response A.3 regarding the level of specificity in the EIR as well as response to comment C155-12. See Master Response I regarding the PDA process.
- C155-9: The comment raises no environmental issues to which a response is required under CEQA.
- C155-10: The comment raises no environmental issues to which a response is required under CEQA.
- C155-11: The comment raises no environmental issues to which a response is required under CEQA.
- C155-12: As Plan Bay Area does not evaluate project-specific operational traffic impacts (instead focusing on regional impacts).. Any local traffic operational issues as identified in this comment should be considered at the local level. Further information on the programmatic nature of this environmental document can be found on page 1.1-4; additional information regarding the Draft EIR's emphasis on regional impacts can be found on page 2.0-1. Also see Master Response A.3 on the specificity of a Program EIR.
- C155-13: The analysis in the Draft EIR was that the project is consistent with the Air District's 2010 Clean Air Plan (CAP). The CAP does not state that sensitive receptors should not be located within 500 feet of a stationary or mobile source of emissions. The Air District recommends that best practices be applied to any new sensitive receptor land uses within this distance and if concentrations of toxic air contaminants and particulate matter are above certain levels the lead agency conduct a more detailed air quality assessment to determine potential health impacts and adequacy of mitigation measures.
- C155-14: The commenter does not identify what makes the "current risk assessment inadequate" to ensure that future residents exposed to harmful levels of TACs. When and if housing is proposed in this area a project-specific review will be conducted. See Master Response A.3 regarding the level of specificity in the EIR.

- C155-15: Overall all criteria pollutants will be decreasing over the life of the proposed Plan, except particulate matter (PM₁₀). This increase in PM₁₀ is primarily due to an increase in re-entrained road dust along heavily traveled highways and roadways due to increases in vehicle miles of travel expected to occur. The Draft EIR identified this impact as significant and unavoidable.
- C155-16: Individual development projects will undergo further environmental review at the project level. County level information has been provided in the EIR when feasible, but does not represent an obligation to evaluate all impacts at that level, nor at a site-specific level. See Master Response A.3 regarding level of specificity in the EIR.
- We acknowledge that Highway 1 was mislabeled as Highway 101 in the Draft EIR Local Pollutant Analysis map for Southern Marin County. This has no effect on the adequacy of the air quality analysis in the Draft EIR. .
- C155-17: The Draft EIR identifies when increased health risk should be more closely evaluated and disclosed by the local lead agency when considering a project application. See the analysis and mitigation measures in Chapter 2.2.
- C155-18: While PM₁₀ emissions are expected to increase with the project, PM_{2.5}, or the finest of particulate matter and most harmful to public health is expected to decrease overall by approximately 5 percent. New State and federal emission standards for vehicles and trucks are anticipated to further reduce these emissions during the life of this project.
- C155-19: The comment raises no environmental issues to which a response is required under CEQA.
- C155-20: Based on the significance thresholds for the local pollutant analysis, the Draft EIR does characterize the severity of the impacts by identifying all areas above this health-based standard. The methodology for the analysis assumes an absolute worst-case exposure for individuals, such as being outdoors 24 hours per day, seven days per week and 365 days per year for a seventy year lifetime. In these areas above the threshold, lead agencies should conduct a more detailed analysis to determine the actual health impacts and identify project alternatives or mitigation measures to lessen any identified impacts.
- C155-21: The Pacific Institute Study (Study) identified areas of high volumes of truck traffic and distribution centers and how they relate to the location of CARE communities. The Study did not include any air pollutant modeling or exposure assessment. The Draft EIR local pollutant analysis identified areas of most concern (above thresholds) and should be further studied prior to locating any sensitive receptors in these areas.
- C155-22: The Draft EIR does not evaluate the potential impacts from an individual land use project that might occur within a jurisdiction. That level of project specific information is not available and it would be purely speculative to do the analysis. The Draft EIR does evaluate the potential air quality impacts based on build out of the anticipated transportation investments by estimating their effect on vehicle miles of travel and congestion. These emission estimates are used to determine what the local and regional air quality impacts will be on existing and future sensitive receptors.
- C155-23: See responses C155-16 and C155-17.

- C155-24: The Bay Area is a non-attainment area for ozone and particulate matter because of emissions from the existing population and not because of future or proposed new development. All the health risk assessment methodology used in the Draft EIR assumes outdoor exposure and not that people are staying indoors, which results in a conservative analysis of a worst-case scenario. See Chapter 2.2 of the Draft EIR.
- C155-25: Whether there are overriding considerations for significant unavoidable adverse environmental impacts is a decision that MTC and ABAG make at the conclusion of the public review process when the Final EIR is being considered for certification. Action on projects to be included in the proposed Plan would take place after EIR certification and be informed by the analysis in this EIR. It should also be noted, however, that the No Project alternative results in more significant impacts than the proposed Plan.
- C155-26: The comment raises no environmental issues to which a response is required under CEQA.
- C155-27: The proposed Plan is designed to focus all future growth within current urban footprint and urban boundary lines. Open space and agricultural preservation is a goal of the Plan.
- C155-28: See Master Response B.1 for information on population projections.
- C155-29: See Master Response B.1 for information on population and projections and their interrelationships.
- C155-30: Economic issues are beyond the range of CEQA review. The comment raises no environmental issue to which a response is required under CEQA. See Master Response F on displacement.
- C155-31: It would be speculative for the EIR to opine about what jurisdictions may do or not do to secure funding and how that would relate to local land use authority, which the proposed Plan respects. See Master Response A.1 for additional information on local control over land use.
- C155-32: MTC and ABAG agree that preservation of open space is important. The proposed Plan performs significantly better than the No Project alternative with regards to impact on farmland, open space, and Williamson Act lands. Impacts on special status species and habitats are fully addressed, and the mitigation measures do take into account the relocation issues by emphasizing the importance of avoiding impacts to protected resources and preserve the function of habitat. Relocation would be a last resort. Avoidance and minimization measures are preferred, which is consistent with a principle of fostering sustainability.
- C155-33: The Draft EIR, Chapter 2.4, evaluates Energy impacts. See Master Response A.3 regarding the level of specificity of the EIR.
- C155-34: See Response C155-12. On a regional scale, Draft Plan Bay Area does include funding to improve safety and enhance communities to make them more attractive to pedestrians, bicyclists, and transit riders – even as regional traffic volumes grow over the life of the Draft Plan. Many of the counties in the region included explicit funding in the Draft Plan for bicycle and pedestrian programs, road safety enhancements, and streetscape improvements. Additionally, the OneBayArea Grant Program provides funding for enhancement projects,

many of which are designed to make streets more accommodating for alternative transportation modes.

C155-35: Comment is acknowledged.

C155-36: The comment raises no environmental issues to which a response is required under CEQA.

C155-37: As this is a programmatic-level assessment, noise from the local heliport cited was not separately quantified and analyzed. Specialized noise assessment, as noted by the responder, would certainly be appropriate if an increase in the licensed activity at this heliport (arrivals and departures) were requested. See Master Response A.3 regarding the level of specificity of the EIR.

C155-38: As this is a programmatic-level assessment, traffic noise and construction noise were evaluated at a regional scale, and site-specific effects related to bay mud were not considered. See Master Response A.3 regarding the level of specificity of the EIR.

C155-39: The comment suggests that the proposed Plan would increase exposure of people and structures to the risk of property loss, injury, or death involving strong seismic ground shaking, effects of liquefaction, building on fill and bay mud, and projected inundation and sea level rise. As discussed in the Draft EIR on page 2.7-25, improvements associated with the proposed Plan would be required to adhere to stringent building codes that include seismic design requirements to minimize potential damage and injury from maximum credible earthquakes in the region as well as secondary effects of liquefaction (see also responses C33-11 and C180-7). Building code requirements also include geotechnical evaluation of the subsurface materials such as the density and susceptibility to settlement under static and dynamic (earthquake) conditions. Site preparation requirements including foundation design and replacement of undocumented fill with engineered fill are standard treatment measures to overcome the potential hazards associated with the presence of fill and bay mud deposits.

As discussed in the Draft EIR on page 2.5-61, there are areas within the planning area that are projected to be susceptible to inundation by estimated sea level rise levels in the future. However, in the absence of definitive timing and extent of sea level rise, Mitigation Measure 2.5(a) through (d) provides the means to implement adaptive management strategies to respond to sea level rise.

C155-40: The comment states that there is a 63 percent chance that a magnitude 6.7 or greater earthquake is likely to occur over the next 30 years and that the San Andreas and Hayward faults are considered to have the highest probability of being the causative faults. The comment also states that the Tamalpais PDA is located within 10-11 miles of both of these faults. The comment is in agreement with the analysis that is already found in the Draft EIR.

C155-41: The comment states that the liquefaction hazard map shown in the Draft EIR fails to correctly show the high liquefaction hazard that is present in Tamalpais Valley. The map presented in the Draft EIR (Figure 2.7-2) is not intended to be used for site specific analysis and as required by the California Building Code, the potential for liquefaction would be determined by a site specific geotechnical investigation. The potential for liquefaction would be determined using laboratory analysis of subsurface soil samples in accordance with industry standard methods and building code requirements on a project-by-project basis.

However, it is noted that Figure 2.7-2 does show, within the constraints of an area-wide figure, Tamalpais Valley to be a zone of high to very high liquefaction hazard.

- C155-42: The comment states that “to choose to intensify development in high seismic risk areas without EIR analysis of the significant effects of the environment shows no regard for the impacts of the environment on people and structures and illustrates illusions about our technological ability to manage and ignore the power of natural forces”. The Draft EIR acknowledges the seismic hazards present in the planning area and provides mitigation to reduce the potential for significant effects to less than significant levels. Seismic design requirements are developed through incorporation of scientific study of past events and continue to be updated.
- C155-43: The comment states that the proposed Plan would have a significant impact related to geology, soils and seismicity in the Tamalpais Valley PDA related to Criterion 2, 3, and 6 of Chapter 2.7 of the Draft EIR. The comment also states that there are high liquefaction hazards and fill and bay mud deposits in this area. As discussed in Chapter 2.7, there is a range of geotechnical hazards present across the planning area including the Tamalpais Valley PDA. The implementation of the mitigation measures presented in Chapter 2.7 would require that each individual project receive a geotechnical investigation that would evaluate the presence or absence of these hazards and provide recommendations for site preparation and/or foundation design to minimize these. As noted in response C155-41, the Draft EIR expressly recognizes high liquefaction potential in Tamalpais Valley.
- C155-44: The comment states that the proposed Plan could increase development within the floodplain and that the mitigation measures do not include avoidance or limitations on development in floodplains that could also result in loss of wetlands. The comment also states that FEMA National Flood Insurance Program requires communities to limit development in floodplains. As stated in the Draft EIR on page 2.8-34, “any developments proposed within the 100-year flood zone would be required to meet local, State and federal flood control design requirements. In general, local jurisdictions have flood control policies that require new construction in flood-prone areas to be built to flood-safe standards, such as ensuring that ground levels of living spaces are elevated above anticipated flood elevations”. Therefore, if proposed development can meet these requirements then the potential impact related to flooding would be less than significant. See response C155-48 for discussion on the potential loss of wetlands.
- C155-45: The comment concerns two Executive Orders including 11990–Protection of Wetlands and 11988–Floodplain Management which are consistent with the Marin Countywide Plan that established the Highway 101 Corridor as an area for preservation. See response C155-48 for discussion of the protection of wetlands. Otherwise the comment is noted and does not address the adequacy of the Draft EIR. However, as stated in response C155-44 above, proposed development located in the 100-year flood zone would be required to adhere to local, State and federal flood control design requirements.
- C155-46: The comment raises no environmental issues to which a response is required under CEQA.
- C155-47: Please refer to Master Response E for more information on the analysis of sea level rise.
- C155-48: The comment states that the proposed Plan will potentially have an adverse effect on sensitive or endangered species, and speculates that it would inhibit restoration of historic

wetlands, and preclude ability to allow for migration inland as sea level rises. The Draft EIR acknowledges that development under the proposed Plan may have adverse effects on sensitive or endangered species and proposes mitigation measures to avoid and minimize such impacts to less than significant (see impact discussion 2.9-1 and Mitigation Measures 2.9(a) through 2.9 (c)). It is acknowledged that there are possible impacts that could result from Plan implementation should a project directly affect wetlands or adjacent upland habitat, specifically the potential to inhibit the restoration of historic wetlands or preclude the ability for tidal marsh wetlands to migrate inland in response to sea level rise. However, project-level review requires a site-specific biological assessment, which would document the presence of wetlands and transitional habitat in the project vicinity, at which time these issues would be considered on a project-specific basis. The text on p. 2.9-67 of the Draft EIR lists potential general impacts on wetlands, including permanent loss of habitat, loss or degradation of function, and fragmentation, and the specific impacts called out by the commenter would be included under the more general categories listed. Please also refer to responses B17-23 and B17-28 regarding wetland avoidance and no net loss and compensatory mitigation requirements should wetland impacts be unavoidable.

The comment further states that some of the proposed development also falls within wetland (WCA) or stream (SCA) conservation areas. Although it is not clearly stated in the comment, it is assumed the comment is referring to Marin County wetland and stream conservation areas, designated by Marin County ordinances. The Draft EIR acknowledges that impacts to wetlands and streams will occur throughout the planning area and provides mitigation measures to avoid and minimize such impacts. While reference is not specifically made to Marin County ordinances it is stated repeatedly throughout the impacts discussions that projects under the proposed Plan would be consistent with local policies and ordinances wherever they occur throughout the Bay Area. For example, specific to wetlands, Mitigation Measure 2.9(d) on pp. 2.9-71 and 2.9-72 states, “Where avoidance of jurisdictional waters is not feasible, project sponsors shall minimize fill and the use of in-water construction methods, and only place fill with express permit approval from the appropriate resources agencies ... and in accordance with applicable existing regulations, such as the Clean Water Act or local stream protection ordinances” and “Compliance with existing local regulations and policies, including applicable HCP/NCCPs, that exceed or reasonably replace any of the above measures protective of jurisdictional wetlands or special-status natural communities”. In addition, the text under Impact 2.9-4 further discusses potential conflicts with local ordinances and proposes measures to mitigate such impacts to less than significance; specifically, Mitigation Measure 2.9(f), which states that “Mitigation shall be consistent with the requirements of CEQA and/or follow applicable ordinances or plans developed to protect trees or other locally significant biological resources”, and, “As part of project-level environmental review, implementing agencies shall ensure that projects comply with the most recent general plans, policies, and ordinances, and conservation plans.” Please also refer to response B17-31, regarding consistency with local ordinances.

The comment also includes several quotations referring to the importance of tidal marsh ecosystems and the transitional ecozone between the intertidal zone and upland habitat, the importance of conserving these areas, the predicted impacts of sea level rise on such habitat, agency definitions of wetlands, the importance of eelgrass beds, and potential impacts of upland development on such resources. Although these passages provide additional detail, these impacts are all addressed at a general level in the Draft EIR, as is appropriate for a program EIR; also refer to Master Response A.3 regarding the level of analysis required in a program EIR.

- C155-49: The comment states that the PDA and adjacent area in Tamalpais Valley include areas occupied by specific special-status species and that development in or adjacent to this habitat would have significant and unavoidable impacts and lists numerous species and several resources that could be impacted. The Draft EIR recognizes that development in or adjacent to sensitive habitat, including habitat supporting special-status wildlife, could have potentially significant effects (see the impact discussions 2.9-1 and 2.9-2) and proposes mitigation measures to reduce such impacts to less than significant levels on a project-specific basis. The Draft EIR also determined that, on a regional basis, all impacts on biological resources would be significant and unavoidable. Furthermore, as noted in Master Responses A.2 and A.3, site- and project-specific impacts not analyzed in this program EIR would be subject to further, more detailed review at the time a specific project is proposed. Whether the impacts of development are within a specific PDA or not, if the impacts of a particular project rise to significant and unavoidable levels would be determined in the subsequent project-specific analysis to be conducted once the location and details of that project are known. The question raised about whether the proposed Plan should be chosen will be considered by MTC and ABAG after EIR certification.
- C155-50: This comment is the first of several (see also comments C155-51 and C155-52) where the commenter provides a quotation from the Draft EIR special-status species impact discussion and then provides lists of species to be added to the impact discussion. Some of the species included are not considered special-status under CEQA and are thus not required to be considered in the Draft EIR. Also refer to Master Response A.3 regarding the level of analysis required in a program EIR.
- C155-51: See response C155-50.
- C155-52: See response C155-50.
- C155-53: This observation is consistent with the visual impact analysis presented in Chapter 2.10.
- C155-54: This comment addresses the boundaries of a Priority Conservation Area (PCA) and adjacent Priority Development Area (PDA). ABAG and MTC acknowledge the commenter's concern regarding the geographic extent of the PDA relative to the extent of the PCA. PDA boundaries were designated by local jurisdictions. Modifying these boundaries is the responsibility of jurisdictions. ABAG and MTC cannot take action in response to this comment as part of the EIR. See Master Response I regarding the PDA process.
- C155-55: Please refer to Master Response G for more information on water supply analysis.
- C155-56: The decision to use desalination as a water source would be solely the decision of MMWD and is not advocated for or required by the proposed Plan. The current MMWD Urban Water Management Plan indicates adequate water supplies through the year 2035 without a need to resort to desalination. The proposed Plan would result in essentially the same year 2040 population as under the No Project alternative - a three percent increase, with the proposed Plan resulting in 500 more households in Marin County than under the No Project scenario. Given the water supplies indicated by MMWD, it is unlikely that additional water supplies will need to be acquired due to growth under the proposed Plan. The current MMWD Urban Water Management Plan indicates adequate water supplies through the year 2035 without a need to resort to desalination. In addition, in August of 2010, the District adopted Ordinance 420, which states that the District shall not approve construction, or

financing for construction, of a desalination facility unless such construction is approved by a majority of District voters, voting in an election held within the District's service area for that purpose. Therefore, this EIR does not assume any desalinated water will be used for Marin County water supplies.

- C155-57: Economic issues are beyond the range of CEQA review. The comment raises no environmental issue to which a response is required under CEQA.
- C155-58: The comment raises no environmental issues to which a response is required under CEQA.
- C155-59: MTC and ABAG agree with the responder's comments.
- C155-60: The comment states that areas within the Tamalpais/Almonte community have been affected by hazardous materials in the past. The comment is concerned with specific potential development sites identified in the Marin County General Plan 2012 Housing Element and the presence, or former presence, of hazardous materials in soil and groundwater at those sites. It is beyond the scope of this programmatic EIR to analyze site-specific conditions. As stated in the Draft EIR Executive Summary (pp. ES-3 and ES-4 of the Draft EIR), this document "is a program EIR, as defined by Section 15168 of the CEQA Guidelines." As such, it presents a general assessment of the environmental impacts of implementing the proposed Plan on a region-wide scale. Individual projects are not addressed in detail, although mention of some possible, or funded projects, are discussed as appropriate. As noted throughout the Draft EIR, all impacts to individual project would be evaluated in the future, by the appropriate implementing agency as required under CEQA and/or NEPA prior to each project being approved. As a program-level EIR, this document, includes mitigation measures to offset potentially significant impacts and sets the basis for subsequent tiering for project-specific or site-specific environmental review. Specific analysis of localized impacts in the vicinity of individual projects is not included in this program level EIR. See Master Response A.2 regarding CEQA streamlining and further environmental review.

It is noted that, as required by Mitigation Measures 2.13(d) in this EIR, proposed improvements would be required to evaluate sites for the potential presence of legacy contamination. See also response C75-16. For information, it is also noted that responses to the comments on the Tamalpais Valley sites mentioned by the commenter were provided in the responses document for the Marin County Housing Element Supplemental EIR.⁶

- C155-61: The comment raises no environmental issues to which a response is required under CEQA.
- C155-62: The comment expresses concerns regarding the potential health risks to construction workers and future residents from vapor intrusion, dermal contact and inhalation. The comment claims that the 2012 Marin County Housing Element EIR did not adequately disclose or analyze this specific hazard and the potential impacts "are not being considered in the analysis of the continued expectations of our PDA in the Bay Plan." The Hazards analysis in the Draft EIR acknowledges the presence of legacy contaminants throughout the planning area, and as such requires implementation of Mitigation Measure 2.13(d) which

⁶ County of Marin, Community Development Agency, *Marin County Housing Element: Supplement to the 2007 Countywide Plan EIR, Final Supplemental Environmental Impact Report/Response to the Draft Supplemental Environmental Impact Report*. May 2013. http://www.co.marin.ca.us/depts/CD/main/pdf/eir/Marin_County_Housing_Element_Final_SEIR_May_2013.pdf

would provide the necessary measures to identify any potential hazardous materials or wastes that could adversely affect construction workers or future residents including the effects of vapor intrusion, dermal contact and inhalation.

- C155-63: With implementation of Mitigation Measure 2.13(d), the potential impacts related to health risks to construction workers and future residents would be less than significant. Please also see Master Response A.3 regarding the scope of this program EIR.
- C155-64: The comment states, “the EIR fails to adequately disclose, analyze and mitigate potentially significant health impacts from soil and groundwater contamination”. See responses C155-62 and -63.
- C155-65: The comment states “The hazard impacts related to land use changes from the implementation of the proposed Plan at the regional and local level are considered potentially significant (PS) Impact 2.13-4”. MTC and ABAG agree with the responder’s comment and note that with implementation of Mitigation Measure 2.13(d) the potential impact would be reduced to a less than significant level.
- C155-66: The comment raises no environmental issues to which a response is required under CEQA.
- C155-67: See response C155-63.
- C155-68: See Master Response A.1 regarding local land use control.
- C155-69: As this is a programmatic-level assessment, safety issues related the local heliport cited were not separately quantified and analyzed. See Master Response A.3.
- C155-70: See response C155-69. It is reasonable for this EIR to assume that jurisdictions, agencies, and people will comply with existing laws and regulations.
- C155-71: Emergency response capability is analyzed under Criterion 7 at a programmatic level in Chapter 2.13, Hazards. In the concluding discussion of “combined effects” under Impact 2.13-7, the Draft EIR notes the substantial body of federal and state law that addresses emergency planning, disaster mitigation and federal and state response capabilities. With all of these programs and regulations in place, the proposed Plan is not likely to interfere with local and subregional emergency response capabilities so this impact is judged less than significant (see. Pg. 2.13-41). It may well be true that emergency response capabilities is one of the factors that Supervisor Sears expects to be addressed by County staff in response to her request for a reconsideration of the PDA designation in the Almona/Tamalpais Valley; see Response C155-8.
- C155-72: See response C155-71.
- C155-73: See response C155-71.
- C155-74: See Master Response B.1, Population Projections, which also addresses job growth.
- C155-75: See Master Response B.1 on population projections. The Draft EIR found in Chapter 2.5 that the proposed Plan attained the GHG emissions reduction targets even with the

transportation impacts identified in Chapter 2.1. MTC and ABAG have adopted goals and objectives for Plan Bay Area that also influence the development strategy; see Chapter 1.2.

- C155-76: See Master Response B.1 on population projections. Alternatives 4 and 5 were named by the advocacy groups who designed them; economic growth is one of the objectives of Plan Bay Area regardless of which alternative is selected, as shown in Chapter 1.2 of the Draft EIR.
- C155-77: The comment does not raise environmental issues not already addressed in this EIR.
- C155-78: The comment raises no environmental issue to which a response is required under CEQA. MTC and ABAG agree with the comments 1, 2 and 5. See Chapter 3.2 of the Draft EIR regarding growth-inducing impacts.
- C155-79: Comment 1 raises no environmental issues to which a response is required. Comment 2 raises the issue of the sufficiency of the sea level rise analysis, which is addressed in Master Response E. Regarding Comment 3 the entirety of the Draft EIR explores environmental impacts of the proposed Plan.
- C155-80: Whether there are overriding considerations for significant unavoidable adverse environmental impacts is a decision that MTC and ABAG make at the conclusion of the public review process when the Final EIR is being considered for certification. Action on the proposed Plan would take place after EIR certification and be informed by the analysis in this EIR. MTC and ABAG believe that this EIR is sufficient for decision-making; your request that the Plan not be approved is acknowledged.

Letter C156 Robert Silvestri (5/10/2013)

- C156-1: ABAG and MTC acknowledge the importance of increasing housing production and preservation in meeting the region's long term demand. Pursuant to SB 375, the SCS identifies "areas within the region sufficient to house all the population of the region, including all economic segments of the population" (Gov. Code § 65080(b)(2)(B)(ii).) The SCS does so by producing a land use pattern sufficient to accommodate RHNA and through ABAG's and MTC's efforts to support additional affordable housing production. This includes Chapter 6 of the Plan, which identifies strategies for facilitating greater affordable housing preservation and production in the region. Many of these efforts require policy changes at the state or federal level that are beyond the control of the regional agencies, who will act as advocates for these changes. The regional agencies are providing more direct support for affordable housing through the Transit Oriented Affordable Housing (TOAH) fund, which supports affordable projects in Priority Development Areas and the identification of Affordable Housing as an allowable use for future Cap and Trade funds. Through these and other mechanisms, MTC and ABAG determined that of the 660,000 new housing units contemplated by the proposed Plan, 26 percent will be affordable to very low income households, 17 percent to low income households, 17 percent to moderate income households, and 39 percent to above moderate income households. (See Draft EIR, p. 1.2-53.) See also Master Response F, which addresses the issue of displacement in greater detail and identifies actions included in the Draft Plan to help address this challenge.

The commenter lists a number of housing types and claims they are not supported or promoted by the Plan. MTC and ABAG disagree. It is true that the proposed Plan is

designed to discourage sprawl-style development and envisions a densification of the regions existing urban areas. While this land use vision will reduce the number of single family homes developed within the region as compared to the No Project alternative, the land use pattern included in the proposed Plan brings jobs, services and housing closer together which serves to support the housing types identified by the commenter including elderly and assisted living facilities, homeless shelters and safe houses, live/work spaces, cooperative housing, and co-housing. Similarly, by focusing future development within the region's existing urbanized areas, the proposed Plan serves to promote the integration of low income housing into existing communities contrary to the commenter's conclusion otherwise.

C156-1.3: See response C156-1. Local jurisdictions retain their land use authority and implementation of the proposed Plan's land development pattern is voluntary; see Master Response A.1 for more information on local land use control.

C156-1.5: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. For additional information of the public participation process for development of the proposed Plan see http://apps.mtc.ca.gov/meeting_packet_documents/agenda_2070/Item_3a_Summary_of_Public_Input.pdf

Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR. As a result of the outreach process two plan alternatives advocated for and designed by stakeholder groups (the business community for Alternative 4 and environmental and social equity advocates for Alternative 5) were included in the Draft EIR. Also see response C156-1 regarding housing affordability and Plan Bay Area.

C156-1.7: See response C156-1.

C156-1.9: The citations in the comment pertain to housing elements. The proposed Plan is a Regional Transportation Plan and Sustainable Communities Strategy, which is a separate program. A housing element is an adopted component of a city or county's general plan. This EIR only evaluates the environmental impacts of the proposed Plan.

C156-2: Plan Bay Area's regional growth forecast starts with projected regional job growth which is the main determinant of ABAG's regional population growth projections. The distribution of growth to individual jurisdictions in Plan Bay Area is a blueprint for growth to achieve the goals and objectives of the Sustainable Communities Strategy (SCS). Plan Bay Area does not anticipate high density development for Marin County: the amount distributed to Marin County is about 8,800 households over 30 years, or less than 300 new households annually for the entire County. The proposed Plan seeks to address the needs and aspirations of each Bay Area jurisdiction, as identified in locally adopted general plans and zoning ordinances, while meeting the requirements of SB 375 and Plan Bay Area performance targets adopted by MTC and ABAG to guide and gauge the region's future growth.

The framework for developing these scenarios consisted of the pre-existing Priority Development Areas (PDAs) and Priority Conservation Areas (PCAs) nominated by local governments. ABAG and MTC incorporated local feedback from individual jurisdictions

relying on their best assessment of feasible growth over the plan period and then applied a series of additional factors to achieve the goals of the Sustainable Communities Strategy (SCS). Since PDAs were nominated by local jurisdictions, it is not anticipated that the proposed Plan will conflict substantially with local land use plans. If there are conflicts, they would be resolved at the local level through area plans and/or general plan or zoning amendments. However, local jurisdictions have local land use authority, meaning that in the case that the proposed Plan does conflict with local zoning or specific plans, the local jurisdiction would have ultimate land use authority. The proposed Plan will only be implemented insofar as local jurisdictions adopt its policies and recommendations. Potential conflicts with local land use plans are evaluated on page 2.3-42 and 2.3-43 of the Draft EIR. See also Master Response A.1 regarding local land use control.

- C156-3: To the extent areas of controversy relate to environmental impacts, they are analyzed at the regional level in the Draft EIR. Potential impacts to visual resources, including various aspects of the appearance of existing communities, are evaluated on pages 2.10-14 through 2.10-34 of the Draft EIR. As noted in the response above, potential conflicts with local land use plans are evaluated on pages 2.3-42 and 2.3-43 of the Draft EIR. See also Master Response A.3 regarding the programmatic nature of this EIR.
- C156-4: The EIR evaluates whether Plan Bay Area would result in the need for new or expanded public service facilities, the construction of which could cause significant environmental impacts. To the extent fiscal implications of population growth on individual jurisdictions has the potential to lead to indirect localized environmental impacts, those impacts are beyond the scope of this programmatic EIR. Implementing agencies considering future second tier plans and projects must comply with CEQA and must consider such indirect localized environmental impacts where necessary.
- C156-5: See responses C156-1 through 4.

Letter C157 Athena McEwan (5/11/2013)

- C157-1: See responses to Letter C156. Pursuant to SB 375, an SCS must identify “areas within the region sufficient to house all the population of the region, including all economic segments of the population...” (Gov. Code § 65080(b)(2)(B)(ii).) The proposed Plan does so by producing a land use pattern that will accommodate HCD’s Regional Housing Needs Determination (RHND) and through ABAG’s and MTC’s efforts to support additional affordable housing production. This includes Chapter 6 of the Plan, which identifies strategies for facilitating greater affordable housing preservation and production in the region. Many of these efforts require policy changes at the state or federal level that are beyond the control of the regional agencies, who will act as advocates for these changes. The regional agencies are providing more direct support for affordable housing through the Transit Oriented Affordable Housing (TOAH) fund, which supports affordable projects in Priority Development Areas and the identification of Affordable Housing as an allowable use for future Cap and Trade funds. Through these and other mechanisms, MTC and ABAG determined that of the 660,000 new housing units contemplated by the proposed Plan, 26 percent will be affordable to very low income households, 17 percent to low income households, 17 percent to moderate income households, and 39 percent to above moderate income households. (See Draft EIR, p. 1.2-53.) Local allocation of housing by income level within the region is an issue handled by the Regional Housing Needs Allocation (RHNA).

See also Master Response F regarding displacement.

Letter C158 Barbara Brookins (5/16/2013)

C158-1: Please refer to Master Response B.1 on population projections as well as Master Response D.2 on the connection between high-density housing near transit and the reduction in greenhouse gas emissions. Please refer to response C157-1 regarding the proposed Plan's effect on increased cost for housing. See also Master Response F provides more detail on issues of displacement. For a detailed description of the water supply analysis as presented in the Draft EIR, please refer to Master Response G. In addition, please refer to Master Response E on sea level rise.

Letter C159 James Campbell (5/17/2013)

C159-1: Please refer to the response C158-1.

Letter C160 Kathi Ellick (5/17/2013)

C160-1: Please refer to Master Response C on requests for extensions of the public comment period.

C160-2: Please refer to Master Response B.1 on population projections.

C160-3: See Chapter 2.5 of the Draft EIR, Impacts 2.5-1 and 2.5-2. See also Master Responses D.1 and D.2 regarding GHG emissions.

C160-4: See response C157-1 and Master Response F regarding displacement.

C160-5: See Chapter 2.12 of the Draft EIR, Impact 2.12-1, as well as Master Response G regarding water supply.

Letter C161 Ronette King (5/16/2013)

C161-1: Please refer to Master Response C on requests for extension of the public comment period.

C161-1.5: This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the Draft Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors. See also Master Response I regarding the PDA process.

The proposed Plan does not specify the density or size of any individual projects; such developments may occur with or without the proposed Plan. See Master Response A.1 regarding local land use control. However, it should be noted that the proposed Plan does not anticipate high density development for Marin County.

C161-2: Please refer to Master Response B.1 on population projections. In addition, please refer to Master Response D.2 on the connection between high density housing near transit and a reduction in greenhouse gas emissions.

C161-3: See response C157-1 and Master Response F regarding displacement. See also Chapter 2.12 of the Draft EIR, Impact 2.12-1, as well as Master Response G regarding water supply.

C161-4: MTC and ABAG may find that the proposed Plan would create significant environmental impacts, but that these impacts would be outweighed by other benefits. In addition many of the significant and unavoidable impacts occur because MTC and ABAG cannot require local implementing agencies to adopt the mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. Please see Master Response A.1 on local control over land use for additional information.

Letter C162 Libby Lucas (5/21/2013)

C162-1: The commenter estimates that the acreage of affected streams, Waters of the US, and wetlands is double that given in the Draft EIR and states that it would not be possible to find enough compensatory mitigation to compensate for the loss. The Draft EIR represents the project team's best estimates based on available data. Actual impacts will be determined on a project-by-project basis. Please also refer to Master Response A.3 regarding the specificity of a program EIR and response B17-23 regarding the requirement for no net loss of wetlands under the Plan and the strategy of requiring replacement habitat only when wetland impacts are unavoidable. Adherence to this strategy would reduce the amount of compensatory mitigation required of individual projects.

C162-2: The comment concerns the reliability of water supply for the proposed growth considering the location of reservoirs and underground aquifers along fault lines on the Santa Cruz Mountain Range. As stated in the Draft EIR on page 2.8-36, the California Division of Safety of Dams (DSOD) is responsible for routine inspection and oversight of all qualifying dams, which would include lower and upper Crystal Springs and San Andreas Reservoirs as well as two smaller reservoirs, Pilarcitos and Stone Dam located along the Santa Cruz Mountain Range. These inspections include scientific evaluation of seismic stability under maximum earthquake scenarios and can require improvements if the dams are deemed inadequate to avoid catastrophic failure. For example, the lower Crystal Springs dam was relatively recently given a seismic upgrade and raised 3 feet in order to increase seismic stability and storage capacity. One of the main purposes of this reservoir is to provide emergency backup for the Hetch Hetchy pipeline system, which crosses several active faults. In general, subsurface aquifers are not adversely affected by earthquakes and as such providers such as the Santa Clara Valley Water District would be able to continue to access underlying aquifers for water supply. Therefore, while some damage from a substantial earthquake may be unavoidable, adherence to regulatory requirements and ongoing seismic upgrades are anticipated to reduce such impacts to a less than significant level.

C162-3: See Master Response B.1 for additional information on population projections. These projections represent an objective estimate of population growth that will occur regardless of the proposed Plan.

C162-4: This EIR does include a robust analysis of the effects of sea level rise on transportation projects, including a list of specific projects potentially affected (see Table 2.5-11). Chapter 2.5, Climate Change, also includes a quantification of the number of people potentially affected by sea level rise (Tables 2.5-15 through 2.5-21) and discusses adaptation strategies. The most up-to-date regional-scale geographic information on flood hazards available from FEMA is shown in Figure 2.8-3. There may be drafts of updated FEMA maps being circulated at the local level. For this EIR, the mapping used was the most accurate, currently available from the Cal-Atlas Geospatial Clearinghouse in 2012, when data collection originated for this EIR. The decision on whether to upgrade Highways 237 and 37 as

causeways is a project-level decision. See Master Response A.3 regarding the programmatic nature of this EIR.

- C162-5: See Chapter 2.8 of the Draft EIR regarding flooding and Master Response A.3 regarding the specificity of a program EIR. This EIR does not evaluate the impacts of individual projects, rather the regional-scale impacts of the entire proposed Plan. Implementing agencies must comply with CEQA in considering approval of future second tier projects.
- C162-6: See Master Response A.3 regarding the specificity of a program EIR. This EIR does not evaluate the impacts of individual projects, rather it analyzes the regional-scale impacts of the entire proposed Plan. Implementing agencies must comply with CEQA in considering approval of future second tier projects.
- C162-7: MTC and ABAG adopted a range of project objectives covering issues ranging from traffic congestion to cost of living to public health. See the Draft Plan and Chapter 1.2 of the Draft EIR for these objectives.

Letter C163 Ada Marquez (5/16/2013)

- C163-1: A description of SB 25 has been added to Chapter 2.2 of the Draft EIR. See Section 2 of this Final EIR for details.
- C163-2: MTC and ABAG do not know the status of the City of San Jose's CRRP. The significance of criteria only applies if a jurisdiction has adopted a CRRP; there is no adverse impact without one.
- C163-3: Such an analysis is beyond the scope of this regional-scale, program EIR. See Master Response A.3 for more information on specificity of program EIRs. Further information on the programmatic nature of this environmental document can be found on page 1.1-4; additional information regarding the Draft EIR's emphasis on regional impacts can be found on page 2.0-1.
- C163-4: The Draft EIR adequately analyzes impacts related to the criteria of significance on air quality. See chapter 2.2 (Air Quality) for further discussion.
- C163-5: The public had an opportunity to submit comments during the CEQA scoping process and the public review of this EIR; for future second tier projects, the public should submit comments to the implementing agency during the administrative process to consider such future projects. BAAQMD is the regional, government agency that regulates sources of air pollution within the nine San Francisco Bay Area Counties and is a valuable resource for the public and implementing agencies alike.
- C163-6: The maps are intended as a visual resource and aid to the reader; the analysis is not dependent upon these figures and providing such a description would not change the conclusions of the EIR. See footnote 20 on page 2.2-41 of the Draft EIR, which says, "Lead agencies for proposed projects should contact BAAQMD if they are unsure whether their project site falls in an impacted area or not."
- C163-7: The comment requests additional information regarding BAAQMD's GIS cumulative analysis conducted in Chapter 2.2. Additional information can be found on pages 2.2-22 and

23 and 2.2-38 through 2.2-41 of the Draft EIR. Page E-10 of Appendix E of the Draft EIR also describes the TAC and PM2.5 data sources.

C163-8: A Health Impact Assessment would be difficult to undertake at a regional scale. See Master Response A.3 for more information on specificity of program EIRs. Further information on the programmatic nature of this environmental document can be found on page 1.1-4; additional information regarding the Draft EIR's emphasis on regional impacts can be found on page 2.0-1. While Health Impact Assessments are not mandated by CEQA, implementing agencies have the discretion to require Health Impact Assessment's in evaluating the impacts of individual second tier projects and such assessments may assist those agencies in complying with CEQA.

C163-9: Environmental justice is not considered a physical environmental impact under CEQA and is instead socio-economic issue. However, MTC and ABAG considered environmental justice concerns in developing the proposed Plan (see the *Equity Analysis Report*) and evaluated potential indirect physical environmental impacts resulting from environmental justice concerns such as disproportionate impacts on communities of concern regarding air quality improvements; see Impact 2.2-6 in Chapter 2.2 of the Draft EIR. See also Master Response F regarding displacement and response C156-1 regarding housing all economic segments of the population within the San Francisco Bay Area.

Additionally, MTC and ABAG receive funding from federal agencies such as the Federal Highway Administration and Federal Transit Administration for some of their programs and activities. MTC and ABAG conduct their federally-funded programs and activities in accordance with guidance issued by the federal agencies pursuant to applicable laws, Executive Orders, regulations and Circulars, some of which are discussed below. MTC and ABAG must also comply with state policies discussed further below.

Federal Regulations

Executive Order 12898

Executive Order (EO) 12898 (59 FR 7629), entitled, "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations," was signed by President Clinton in 1994. The executive order requires that Federal agencies identify and address, when appropriate, "...disproportionately high and adverse health or environmental effects of its projects, policies, and activities on minority populations and low-income populations..." Two specific provisions of EO 12898 provide further guidance to federal agencies. Section 1-103 requires that each Federal agency develop an agency-specific environmental justice strategy defining how the agency will identify disproportionate adverse effects on minority and low-income populations and attempt to avoid those effects. Section 2-2 requires that federal agencies perform their actions and programs in a manner that neither excludes minority and low-income populations from relevant participation in the action or program nor denies those groups the benefits of the action.

Title VI of the Civil Rights Act of 1964

Title VI of the Civil Rights Act of 1964 states that, "No person ... shall, on the grounds of race, color, or national origin, be excluded from participation in, be denied benefits of, or be subjected to discrimination under any program or activity receiving Federal financial

assistance.” Additionally, Title VI prohibits any recipients of federal funding from intentionally discriminating against groups of people based on race, ethnicity, or national origin or from instituting projects or programs that exhibit, “adverse disparate impact discrimination.” Amended by the Civil Rights Restoration Act of 1987, the prohibition against discrimination was made to include the entire program or activity receiving federal funding.

Federal-Aid Highway Act of 1970

The Federal-Aid Highway Act of 1970 states that agencies must assure that the economic, social, and environmental effects of a federally-supported highway project should be fully considered during the development process and that decisions should be made with regard to the best overall public interest, balancing the need for a fast, safe, and efficient transportation network and the costs of eliminating adverse impacts.

Federal Highways Administration (FHWA) Order on Environmental Justice

In 1998, the FHWA issued an environmental justice order that outlined the information that should be obtained in order to conduct an environmental justice analysis, as well as a series of steps that should be taken by the administration to prevent disproportionately high and adverse impacts to minority and low- income persons. The information required includes:

- The race or national origin and income level of the population served and/or affected;
- The proposed steps to guard against disproportionately high and adverse effects on persons on the basis of race and national origin;
- The present and proposed membership by race or national origin in any planning or advisory body that is part of the program.

The steps included to prevent disproportionately high and adverse impacts include:

- Identifying and evaluating environmental, public health and interrelated social and economic effects of FHWA programs, policies and activities;
- Proposing measures to avoid, minimize and/or mitigate disproportionately high and adverse environmental and public health effects and interrelated social and economic effects, and providing offsetting benefits and opportunities to enhance communities, neighborhoods and individuals affected by FHWA programs, policies and activities, where permitted by law and consistent with EO 12898;
- Considering alternatives to proposed programs, policies and activities, where such alternatives would result in avoiding and/or minimizing disproportionately high and adverse impacts, consistent with EO 12898;
- Providing public involvement opportunities and considering the results thereof, including providing meaningful access to public information and soliciting input from affected minority and low-income populations in considering alternatives during the planning and development of alternatives and decisions.

American with Disabilities Act of 1990

The American with Disabilities Act of 1990 extends the Civil Rights Act of 1964 to people with disabilities and requires transportation planners to involve the disabled communities in the design and development of projects and programs.

Executive Order 13166

Executive Order 13166, entitled “Improving Access to Services for Persons with Limited English Proficiency” requires federal agencies to develop processes that incorporate members of the community with limited English proficiency in a manner, “without unduly burdening ... the fundamental mission of the agency.”

DOT Order 5610.2

Department of Transportation Order 5610.2 outlines the importance of the interests and wellbeing of minority and low-income populations during transportation decision-making tasks. While the order does not institute any additional requirements, it does reinforce existing environmental justice laws. Ultimately, it states that that the DOT should not carry out any programs or policies that would disproportionately accrue to minority or low-income populations unless, “further mitigation measures or alternatives that would avoid or reduce the disproportionately high and adverse effect are not profitable.” The order also states that benefits of a program or policy should be addressed when determining impacts to environmental justice populations to determine if these benefits would offset adverse impacts.

Federal Transit Administration (FTA) Circular 4702.1A

The subject of FTA Circular 4702.1A is “Title VI and Title VI-Dependent Guidelines for Federal Transit Administration Recipients.” It is intended to provide guidance and instructions necessary to carry out DOT Title VI regulations (49 CFR Part 21) and to integrate DOT Order 5610.2 and policy guidance Concerning Recipients’ Responsibilities to Limited English Proficient Persons to agencies receiving funding from the Federal Transit Administration. In its role as a metropolitan planning organization and agency which passes FTA funding through to other entities, MTC is expected to:

- Ensure that the level and quality of transportation service is provided without regard to race, color, or national origin;
- Identify and address, as appropriate, disproportionately high and adverse human health and environmental effects, including social and economic effects of programs and activities on minority populations and low-income populations;
- Promote the full and fair participation of all affected populations in transportation decision making;
- Prevent the denial, reduction, or delay in benefits related to programs and activities that benefit minority populations or low-income populations; and

- Ensure meaningful access to programs and activities by persons with limited English proficiency.

State Regulations

California Government Code Section 65040.12

For the purposes of the Section 65040.12, environmental justice is defined as “the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies.” Section 65040.12 requires the Office of Planning and Research to:

- (1) Consult with the Secretaries of the California Environmental Protection Agency, the Resources Agency, and the Business, Transportation and Housing Agency, the Working Group on Environmental Justice established pursuant to Section 72002 of the Public Resources Code, any other appropriate state agencies, and all other interested members of the public and private sectors in this state.
- (2) Coordinate the office's efforts and share information regarding environmental justice programs with the Council on Environmental Quality, the United States Environmental Protection Agency, the General Accounting Office, the Office of Management and Budget, and other federal agencies.
- (3) Review and evaluate any information from federal agencies that is obtained as a result of their respective regulatory activities under federal Executive Order 12898, and from the Working Group on Environmental Justice established pursuant to Section 72002 of the Public Resources Code.

California Government Code Section 11135

MTC and ABAG receive a portion of the funding used for its projects from the State of California. Pursuant to California Government Code section 11135, no person in the State of California shall, on the basis of race, national origin, ethnic group identification, religion, age, sex, sexual orientation, color, or disability, be unlawfully denied full and equal access to the benefits of, or be unlawfully subjected to discrimination under, any program or activity that is conducted, operated, or administered by the state or by any state agency, is funded directly by the state, or receives any financial assistance from the state.

Other Guidance

In addition to these California Government Code Sections, there are a two policies/directives associated with Environmental Justice and fair treatment that have been issued by Caltrans. These include California Department of Transportation Director Policy No. 21 and the California Department of Transportation Deputy Directive No. DD-63. While these documents do not apply directly to the proposed Plan, it is important to note that these documents are in place to guide Caltrans as they make improvements and changes to the existing transportation network in the San Francisco Bay Area.

Local Plans and Policies

A number of local planning documents, planning goals, and policies have been implemented by local agencies in the San Francisco Bay Area to ensure the fair treatment of community members. These local plans and policies are in place to reduce disproportionate impacts to environmental justice populations and other communities of concern. Local implementing agencies will consider such local plans and policies in exercising their discretion to approve or deny individual projects.

- C163-10: The proposed Plan is not the cause of climate change or the region's population growth, and would therefore not create any "unequal impacts" compared to existing conditions that would not occur otherwise under the No Project alternative. However, the EIR does examine disproportionate impacts on communities of concern regarding air quality improvements; see Impact 2.2-6 in Chapter 2.2 of the Draft EIR.

Letter C164 Merrilie Mitchell (5/16/2013)

- C164-1: Please see Master Response C regarding requests for extensions of the public comment period. MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.
- C164-2: The VMT tax is only a consideration as a component of Alternative 5. It is not being considered as a part of the proposed Plan, but commenter's opposition to the VMT tax is acknowledged. If a VMT tax is pursued, many details of implementation and the possible effects would be evaluated further.
- C164-3: The proposed Plan does not call for the elimination of buses on smaller streets, nor the concentration of big buses on main corridors. Such details of transit operations are the responsibility of the region's transit operators and beyond the authority of MTC and ABAG.
- C164-4: These comments appear to internal issues within the City of Berkeley. Priority Conservation Areas (PCAs) were nominated by local governments. The proposed Plan does not regulate local land use and local jurisdictions, such as the City of Berkeley, retain the discretion to preserve any lands within its jurisdiction whether or not they are located within a PCA identified in the proposed Plan. See Master Response A.1 regarding local land use control.
- C164-5: Priority Development Areas (PDAs) and Priority Conservation Areas (PCAs) were nominated by local governments. In addition, local jurisdictions have local land use authority, and will be responsible for individual permitting decisions and the protection of historic resources and trees. The proposed Plan will only be implemented insofar as local jurisdictions adopt its policies and recommendations. Please refer to Master Response A.1 on local control over land use and Master Response I regarding the PDA process.

Letter C165 Robert Piper (5/16/2013)

- C165-1: Travel demand forecasts were developed by Travel Model One, including forecasts of bicycle trips in future years. Note that travel demand models are calibrated based on decades of historical travel data to avoid extrapolating short-term trends. MTC and ABAG believe

the forecasts are reasonable. However, MTC and ABAG acknowledge the forecasts are conservative. Use of conservative forecasts for bicycling ensured that GHG emissions reductions analysis was also conservative. Additional information about the forecasting methodology can be found in the *Draft Plan Bay Area Summary of Predicted Traveler Responses*.

C165-2: While bicycling has increased significantly within the City of San Francisco over the past decade, this growth has been less significant in suburban and rural areas of the region where longer travel distances and higher speed limits make bicycling less competitive with other modes. As noted in the response C165-1, it would be inappropriate to extrapolate short-term trends when calibrating long-range travel models. While focused growth in Priority Development Areas helps to grow the number of pedestrian and bicycle trips as part of the Draft Plan, many individuals residing and working in these areas will still choose to drive. The Draft Plan works to reduce greenhouse gases not only by shifting trips to non-automobile travel modes but also by reducing driving distances (as a result of bringing origins and destinations closer together).

C165-3: Refer to responses C165-1 and C165-2.

C165-4: As shown in Table 2.1-11 of the Draft EIR, revised in Section 2 of the Final EIR, Bay Area roadway lane-miles only increase by 4 percent as a result of the transportation investments in the proposed Plan. When compared to the regional population growth (30 percent over the life of the Plan, as shown in Table 2.1-10), it is clear that roadway capacity increases in the proposed Plan are relatively limited. The proposed Plan invests much more significantly in operating and maintaining the existing system, rather than constructing additional roadway capacity.

C165-5: Travel forecasts developed by Travel Model One properly incorporate the impacts of induced demand (i.e. additional trips generated as a result of capacity-increasing projects). Additional information about the forecasting methodology can be found in the *Draft Plan Bay Area Summary of Predicted Traveler Responses*.

C165-6: The individual impacts of all uncommitted projects (on metrics such as VMT and GHG) were analyzed as a part of the Project Performance Assessment. Additional information on this analysis can be found in the *Plan Bay Area Draft Performance Assessment Report*. As a program EIR, project-level impacts were not quantified individually in the Draft EIR as this analysis is focused on the cumulative impacts of all transportation projects and land use changes; see Master Response A.3 for more information on program EIRs. Further information on the programmatic nature of this environmental document can be found on page 1.1-4; additional information regarding the Draft EIR's emphasis on regional impacts can be found on page 2.0-1.

The proposed Plan is designed to accommodate the region's projected growth through 2040 while holding in-commuting at 2010 rates, which it does as discussed in Chapter 2.3 on land use impacts. Chapter 3.2 of the Draft EIR discusses growth-inducing impacts and on page 3.2-18 notes that, "While the proposed Plan would continue to import employed residents, this is consistent with historic trends, and does not represent inducement of growth outside the region beyond that which is reasonably expected." Furthermore the MTC Travel Model captures vehicle miles travelled within the nine-county region, and the GHG emissions from such trips. The proposed Plan is designed to provide adequate development capacity for the projected job growth within the region, and housing for the related households as well.

Ultimately if Bay Area residents commute to jobs outside the region, or more workers than anticipated commute into the Bay Area, that is beyond the control of MTC and ABAG; the proposed Plan represents the best attempt to ensure that conditions are set to avoid such situations.

Finally, future conditions under the proposed Plan do reflect a lower level of per-capita vehicle miles traveled (as shown in Table 2.1-17 of the Draft EIR). This is consistent with the recent trend of stagnating growth in driving; however, it should be noted that that near-term trend is partially due to the recent recession affecting employment levels and economic output (which in turn led to reduced travel demand). Forecasted increases in total VMT under year 2040 Plan conditions are primarily a result of increased levels of population and employment – metrics that reflect the forecasted robust economic growth over the coming decades.

Letter C166 Thomas Rubin (5/16/2013)

- C166-1: The fact that the commenter and the commenter's consultant disagree with MTC's and ABAG's conclusions does not undermine the validity of those conclusions. "Challenges to the scope of the analysis, the methodology for studying an impact, and the reliability or accuracy of the data present factual issues, so such challenges must be rejected if substantial evidence supports the agency's decision as to those matters and the EIR is not clearly inadequate or unsupported." (*Federation of Hillside & Canyon Assns. v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1252 (*Federation*).)
- C166-2: MTC's and ABAG's conclusions, including the population projections, are well supported. See Master Response B.1 for a detailed discussion of population projections. In particular, see the June 11, 2013 memorandum from Stephen Levy at the Center for the Continuing Study of the California Economy, which provides detailed responses to the Beacon Report submitted by the commenter. The memorandum can be found at: <http://onebayarea.org/regional-initiatives/plan-bay-area/draft-plan-bay-area/supplementary-reports.html>
- C166-3: Please see response C166-2.
- C166-4: The assertions in the comment stem from the commenter's disagreement with the population projections. See response C166-2.
- C166-5: Please refer to response C166-2. MTC and ABAG based the Plan and the EIR on accurate population projections and therefore disagree with the commenter's assertions that the impacts in the EIR are over-stated.
- C166-6: See response C166-4. See also Master Response D.1 regarding SB 375's GHG reduction requirements. As discussed in Master Response B.1 in greater detail, the California Air Resources Board (CARB) and Department of Finance support the population projection methodology used for the proposed Plan. Master Response D.2 explains that CARB has also preliminarily approved MTC's and ABAG's GHG reduction methodology.
- C166-7: The assertions in the comment all stem from the commenter's disagreement with the population projections. See response 166-1 through 166-5. The commenter references the joint memorandum prepared by ABAG, the Department of Housing and Community

Development (HCD), and the Department of Finance (DOF), discussed in greater detail in Master Response B.1, in which the differences between the agencies' population projections are explained and ABAG's methodology is found to be reasonable. The commenter disagrees with the agencies' conclusions and opines that employment growth is over-stated. The commenter's opinion does not undermine the basis for the population projections. See response 166-1 through 166-5.

- C166-8: The commenter is incorrect to assert that the population projections are based solely on two years of employment trends. The excerpt the comment refers to simply points out that DOF did not take the latest employment trends into account. It does not mean ABAG's population projections are based solely on those two years. ABAG relied on various expert agencies and researchers in developing population projections for the Plan, as described in greater detail in Master Response B.1.
- C166-9: The commenter lists various unsupported opinions describing the Bay Area as an unfriendly business region. The commenter's opinion is at odds with the recent employment trends discussed in the June 13, 2013, Levy memorandum and in "Bay Area Job Growth to 2040" (see Master Response B.1). Again, the commenter's assertions stem from the fact that the commenter disagrees with ABAG's population projections. The commenter fails, however, to cite any specific evidence that could undermine ABAG's methodologies or projections.
- C166-10: The commenter incorrectly assumes that ABAG relied solely on job growth as the basis for its population projections. While job growth is the main determinant of population growth, ABAG also relied on DOF fertility and mortality assumptions, migration rates, and demographic projections.

Letter C167 Susan Samols (5/16/2013)

- C167-1: Please refer to Master Response B.1 on population projections. Also see Letter A16 from the City of Sausalito, which did not request any changes to the jobs and housing development proposal for the City.
- C167-2: While the streamlining benefits of the proposed Plan may serve to reduce time and costs associated with complying with CEQA, the ultimate land use authority provided to local agencies to approve, modify, or deny proposed projects within their jurisdiction is not diminished by the proposed Plan. Please refer to Master Response A.1 on local control over land use and Master Response A.2 on CEQA streamlining options.
- C167-3: The programs commenter mentions are components of the State's Scoping Plan to reduce GHG emissions and the Climate Program Initiatives of the proposed Plan. Please refer to Master Response D.1 regarding the SB 375 GHG analysis and Master Response D.2 on the connection between high-density housing near transit and the reduction in greenhouse gas emissions.
- C167-4: Please note that growth is expected to occur within the Bay Area region regardless of implementation of the proposed Plan. See Master Response B.1 regarding population projections.

C167-5: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C168 Judy Schriebman (5/16/2013)

C168-1: Please see Master Response C regarding requests for extensions of the public comment period. MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

Note that the proposed Plan would result in only around 500 additional households in Marin County by 2040 compared to the growth expected under the No Project alternative; see Chapter 3.1 of the Draft EIR.

Letter C169 Jim Shroyer (5/15/2013)

C169-1: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

C169-2: Please refer to Master Response B.1 on population projections as well as Master Response D.1 on the greenhouse gas emissions included in analysis for the SB 375 target. The proposed Plan must attain per capita GHG emissions reductions from a 2005 baseline, as required by SB 375 and explained in Chapter 2.5 of the Draft EIR.

Letter C170 Thomas Smith (5/12/2013)

C170-1: Local jurisdictions nominate PDAs and submit them to ABAG for inclusion in the PDA program. MTC and ABAG do not develop the PDA. The City of Orinda master plan referenced by the commenter has no direct relation to the proposed Plan. Under State law (CEQA) land use plans are projects that must comply with CEQA. See Master Response A.1 regarding local land use control and Master Response I regarding the PDA process.

C170-2: MTC and ABAG are relatively limited in the strategies permitted to attain the SB 375 GHG emissions reductions targets; see Master Response D.1 for details. MTC and ABAG believe that the transportation program and land development pattern proposed represent an effective and realistic strategy. SB 375 requires that an SCS, such as Plan Bay Area, include a land development pattern that is supported by transportation projects, yet also notes that the SCS does not override local land use authority; see Master Response A.1 on local land use control. The No Project alternative was developed in a manner that complies with CEQA; incorporating specific zoning changes that may occur in the future under the No Project alternative would be speculative. The No Project alternative did assume that urban boundary lines expand at historic rates of expansion. See page 3.1-5 for more information on the land use policies of the No Project alternative.

- C170-3: The RTP/SCS for the Bay Area must be updated every four years. The next update will evaluate the region's progress in attaining the GHG emissions reduction targets and may adjust transportation and land use strategies accordingly.
- C170-4: SB 375 requires the proposed Plan to include a land use plan that can house all economic segments of the population. See response C157-1 and Master Response F for more information.
- C170-5: Please see responses C170-1, 2, and 4. MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.
- C170-6: MTC and ABAG believe that the EIR represents an accurate and objective analysis of environmental impacts, provides feasible and effective mitigation measures, and examines a reasonable range of alternatives to the proposed Plan. Please see Master Response C regarding requests for extensions of the public comment period; see also response C170-5.

Letter C171 Panos Prevedouros (5/7/2013)

- C171-1: MTC and ABAG believe the estimates are reliable for the task at hand: providing decision-makers information to guide long range planning decisions. The commenter is correct that the alternatives analyzed in the EIR cause similar environmental impacts and similar performance results. These similarities are largely a result of the influx of roughly 2.1 million new residents through 2040, its expansive reach (covering 9 counties and 101 cities), and due to the limitations on MTC and ABAG's ability to enforce mitigation measures identified in the program EIR. However, MTC and ABAG believe certain differences in the results, as well as differences in the policies incorporated in each alternative that lead to said results, are meaningful (the term "significant" is not defined in the letter) and useful for illustrating the likely impacts of policies on land use outcomes and traveler responses.
- C171-2: MTC and ABAG agree that UrbanSim, just as with any model, may be improved via uncertainty analysis. In no way is the mere existence of transportation infrastructure seen as a sufficient condition for generating economic growth in UrbanSim. The statistical tables underlying the demand sub-models show the range of factors that combine in creating growth. And in the results, some areas with great transportation options fail to generate even average levels of increase. Similarly, the statistical tables outline the many drivers of residential location choice. UrbanSim's discrete choice framework allows for the incorporation of a wide range of factors in influencing residential location choice as opposed to the historical accessibility-dominated models you describe.
- C171-3: UrbanSim is used here to distribute growth within the nine county Bay Area. As a simplification, it ignores the competition for land in neighboring counties, states, and countries. MTC and ABAG believe this simplification is reasonable for the purposes of (a) efficiently creating a reasonable range of Draft EIR alternatives and (b) filling in sub-travel-analysis-zone details. The criticism put forward here is theoretical and does not in any way suggest that UrbanSim fails to do either (a) or (b). Further, it fails to suggest a superior

approach to tasks (a) and (b). MTC and ABAG believe UrbanSim is the best available planning tool for this RTP/SCS cycle and EIR.

- C171-4: The UrbanSim model respects the inputs provided by model users, which allows for an assessment of how policy decisions impact policy outcomes. MTC and ABAG find this approach more valuable than a land use model that ignores policy inputs, such as zoning. More complex frameworks have tried to simulate changes in base zoning but the foundations for such a simulation are highly speculative. Since MTC and ABAG's goal was to create a No Project for a region with highly-involved residents, along with a range of alternatives defined by varying policies, we found a strong respect for existing policy to suit our goal.
- C171-5: The comment erroneously assumes that decisions made for Plan Bay Area will not be changed for the next 30 years. This is incorrect. The Regional Transportation Plan and Sustainable Communities Strategy will be updated in four years. MTC and ABAG agree that UrbanSim, just as with any model, can be improved via sensitivity testing. MTC and ABAG, nevertheless, believe UrbanSim is the best available planning tool for the current RTP/SCS cycle and this EIR.
- C171-6: The UrbanSim model was used to (a) efficiently create a reasonable range of Draft EIR alternatives and (b) fill in sub-travel-analysis-zone details. The criticism put forward here is theoretical and does not in any way suggest that UrbanSim fails to do either (a) or (b). Further, it fails to suggest a superior approach to tasks (a) and (b). MTC and ABAG believe UrbanSim was the best available planning tool for this RTP/SCS cycle and EIR. MTC and ABAG agree that UrbanSim, just as with any model, can be improved via quality assessments of input data.
- C171-7: The comment erroneously assumes that decisions made for Plan Bay Area will not be changed for the next 30 years. This is incorrect. The Regional Transportation Plan and Sustainable Communities Strategy will be updated in four years. If and when telecommuting and/or any other policies begin to gain traction, changes will be made accordingly. In addition, as the commenter notes, new HOT lane and cordon pricing projects are anticipated to be implemented over the life of the Plan. MTC and ABAG will continue to monitor new programs and research to update our analysis tools to the greatest extent possible. The author of the comment, notably, does not suggest any actual foreseeable future behavioral patterns that MTC and ABAG may have ignored in the Draft EIR.

C171- Comments included on pages 15 to 17: See response C171-3 regarding boundary effects. See response C171-4 regarding land use development constraints assumed. See responses C171-5, 5 and 7 regarding the appropriate use of the model and future changes to the analysis tools that can be made if and when various policies and programs demonstrably change behavior.

Letter C172 Panos Prevedouros (5/13/2013)

- C172-1: MTC and ABAG are mandated by federal and State law to create a regional transportation plan and land development pattern that, among other mandates, provides enough housing to accommodate projected regional growth and attains the per capita GHG emissions reduction targets for passenger vehicles and light trucks assigned by ARB. The most effective strategy to meet many of these requirements, as well as the project objectives adopted by MTC and ABAG, is to bring jobs and housing closer together, thus reducing trip

average length, and to promote transit-oriented development while emphasizing the operations and maintenance of existing roadways and transit systems.

Per CEQA, an EIR is unconcerned with cost effectiveness or speed, it is intended to publicly disclose and propose mitigations for potential environmental impacts and to evaluate a reasonable range of alternatives, for consideration by decision-makers prior to plan adoption. CEQA requires an EIR to identify the environmentally superior alternative, which may not be the No Project alternative. Based on the comparative impact analysis in Chapter 3.1 of the Draft EIR, this EIR appropriately identified Alternative 5 as the environmentally superior alternative. The project decision-makers, the MTC Commission and ABAG Board, are not bound to select the proposed Plan or the environmentally superior alternative.

The commenter correctly list several significant and unavoidable impacts under the proposed Plan. However, as shown in Chapter 3.1 of the Draft EIR, every alternative including the No Project alternative would experience the same significant and unavoidable impacts. This suggests that all of these impacts are the result of population growth and are effectively inevitable. Furthermore, the No Project alternative would create additional significant and unavoidable impacts beyond those under the proposed Plan, suggesting that the proposed Plan effectively mitigates environmental impacts that would occur otherwise and thus provides a beneficial effect.

C172-2: See Master Response B.1 on the population projections.

C172-3: This comment primarily addresses the funding levels in the Draft Plan, rather than the Draft EIR analysis. As identified on page 1.2-50 of the Draft EIR, Plan Bay Area will “fully fund timely transit vehicle replacement and 70 percent of the other high priority transit capital needs. Furthermore, [it] will fully fund operating needs for existing transit services”. This represents a significant regional commitment to fund transit operations and maintenance – beyond the commitment levels in *Transportation 2035*.

The Draft Plan’s funding levels for operations and maintenance (87 percent of total funding) reflect the Commission’s “Fix It First” policy. MTC acknowledges that a transit capital maintenance shortfall does remain, even with the funding levels proposed in the Draft Plan. Yet this issue is not unique to public transit. Funding shortfalls also remain for local streets and state highways in the Draft Plan, simply due to the relative age of the region’s infrastructure for both roads and transit.

C172-4: As noted on page 7 of the *Draft Forecast of Jobs, Population and Housing* supplementary report and page 18 of the *Draft Summary of Predicted Land Use Responses* supplementary report, the full 2010 Decennial Census is used to inform both the 2010 population estimates and the 2040 population projections – and, as follows, the 2010 and 2040 estimates of travel-related outcomes.

C172-5: This comment primarily addresses the funding priorities of the Draft Plan, rather than the Draft EIR analysis. It correctly points out that a greater proportion of funding per traveler is being directed towards public transit, although MTC does not agree with the calculation assumptions used by the commenter to derive the specific ratios. This funding allocation is consistent with the adopted targets of Plan Bay Area, which include increasing non-auto mode share and reducing per-capita greenhouse gas emissions. By shifting a measurable

share of peak period trips to public transit, automobile travel demand can be reduced (along with its associated emissions) and growth in regional traffic congestion can be slowed. Note that the travel demand model does incorporate freight flows and non-commute travel as part of regional travel forecasts for the Draft EIR. It does not specifically include emergency vehicle traffic, but these vehicles are a very small share of regional travel demand.

C172-6: The regional travel demand model (Travel Model One) does capture transit delays as a result of traffic congestion. For transit vehicles operating in mixed flow, the transit passengers' travel time reflects vehicle speeds on the roadway, combined with a land use factor that incorporates expected delay from bus stops (caused by passenger boardings and alightings). These transit delay impacts are incorporated into overall transit travel times, as shown in Draft EIR Tables 2.1-14 and 2.1-15; this is consistent with automobile travel times for those impact areas, which include associated automobile delay impacts.

C172-7: Refer to the response C153-9 regarding the forecasted growth in transit mode share in comparison to historical trends.

C172-8: See Master Response D.1 which describes what technologies are allowed to be included when calculating GHG emissions for SB 375 targets. MTC and ABAG are not permitted to take many technologies and fuel efficiency standards into account.

C172-9: Refer to the response C172-16 regarding the connection between investments in public transit and delay from traffic congestion.

C172-10: Regional travel models are not designed to conduct intersection-level operational analyses; however, intersection-level delays are approximated by adjusting effective lane capacities by place type. For example, the narrow urban streets of San Francisco (with short block lengths) have a lower effective lane capacity than the wider suburban streets (with longer block lengths) of southern Alameda County. The lower effective link capacity serves as a proxy for the delays caused by the greater number of congested intersections in urban locations. Additional information on the travel modeling process can be found in the Draft Summary of Predicted Traveler Responses.

As noted on Page 2.1-22 of the Draft EIR, this analysis focuses directly on regional impacts, rather than impacts to specific local intersections. Any local traffic operational issues, as identified in this comment, should instead be mitigated as part of local project analyses, rather than this program Draft EIR. See also Master Response A.3 regarding the programmatic nature of this EIR.

C172-11: The justification for the 80 percent transit capacity threshold can be found on page 2.1-36 of the Draft EIR. Given that most of the region's public transit services rely on buses (where standing is relatively onerous for passengers compared to heavy rail or metro rail), it would be inappropriate to use heavy rail crush loading levels for the regional transit significance threshold. It is important to note that, even with the 80 percent threshold, regional transit capacity would have no adverse impact on system performance, as shown in Table 2.1-37.

C172-12: Refer to the response C172-9 regarding the proposed Plan's allocation of funding between roads and public transit. MTC disagrees with this comment's conclusion that the proposed Plan's funding allocation leads to greater vehicle delay; instead, increases in vehicle hours of delay under year 2040 Draft Plan conditions are primarily a result of regional population and

employment growth. Furthermore, as shown in Table 3.1-8 of the Draft EIR, the proposed Plan results in lower levels of vehicle delay than the No Project alternative, in which only committed projects were allowed to proceed. Therefore, the proposed Plan's significant investments in public transit, combined with limited expansion of the roadway network, and more focused land use pattern, reduce total vehicle hours of delay compared to No Project conditions.

- C172-13: The Draft EIR specifically examined the traffic congestion impacts of the proposed Plan under Impact 2.1-3 and determined that significant, unavoidable impacts related to per-capita VMT under congested (LOS F) conditions would occur under year 2040 Plan conditions. Mitigation measures 2.1(a), (b), and (c) would help to address the traffic congestion impacts related to Plan implementation. Note that the proposed Plan's significant allocation of funding towards public transit helps to reduce traffic congestion on the region's roadway network and thus reduce impacts under Impact 2.1-3.
- C172-14: Travel demand forecasts were developed by Travel Model One, including forecasts of transit boardings in future years. Additional information about the forecasting methodology can be found in the *Draft Plan Bay Area Summary of Predicted Traveler Responses*. While Plan Bay Area forecasts significant growth in transit ridership and utilization, this is primarily a result of the Plan's highly focused land use pattern around the existing and planned regional transit system. By focusing growth in Priority Development Areas near frequent transit, this will provide a much greater number of potential riders in close proximity to transit stations and stops. Historically, major U.S. metropolitan areas have continued to grow outward, as opposed to focusing growth in the urban core; the envisioned shift in land use growth patterns is a primary driver of the differences between historic ridership growth trends in the Bay Area and the forecasted ridership growth in Plan Bay Area. For additional detail, refer to the response C153-9 regarding the forecasted growth in transit mode share in comparison to historical trends.
- C172-15: Travel times between modes in Tables 2.1-14 and 2.1-15 of the Draft EIR are not directly comparable, as travel distances and corridor congestion differ substantially between modes. For example, walking and bicycle trips tend to occur on short local trips, while some transit trips (e.g. express bus, commuter rail, heavy rail) must traverse long distances. In fact, suburban transit expansion projects included in the proposed Plan lead to a long-distance travel mode shift towards transit that cancels out reductions in average transit travel times elsewhere in the region. Similarly, automobile trips are often taken when a route is relatively congestion-free, while transit trips often occur along slow-moving congested corridors; this further skews the results towards shorter travel times for autos and longer travel times for transit. In conclusion, travel time comparisons would only be appropriate when comparing a specific set of origins and destinations across the various modes.
- C172-16: All of the alternatives, with the possible exception of the No Project alternative that only pursues committed transportation projects, address issues of mobility and traffic congestion. However, they generally emphasize land use strategies, road efficiency improvements, transit efficiency and expansion projects, and non-motorized facility expansion to improve regional mobility, rather than traditional highway expansion efforts. Pursuing a regional highway capacity-increasing approach would likely have additional environmental impacts and would not address the Plan's primary goal of reducing per-capita greenhouse gas emissions under Senate Bill 375. Furthermore, it would likely degrade performance for most of the Plan's adopted performance targets (shown on page 1.2-22 of the Draft EIR).

- C172-17: See Master Response A.3 regarding specificity of a program EIR. This EIR examines the regional and generalized local impacts of the proposed Plan as a single project and does not analyze impacts from individual projects. Significant noise from proposed transit systems, and noise affecting proposed land use projects, will be examined in the project-level environmental review for those projects where necessary. Note that the one instance of “electrified” in Chapter 2.6 of the Draft EIR refers specifically to trolley buses in San Francisco (p.2.6-9); the quote in the comment refers to BART in the TransBay tunnel.
- C172-18: The text and the figure match. The text refers to hourly average noise level (L_{eq}) and the day-night average level (L_{dn}), which are defined on p. 2.6-4. These are noise descriptors that explain how sound is measured, but the units are decibels for both.
- C172-19: The commenter states that a 10 ft. concrete noise barrier at an expressway cross-section reduces noise levels by about 11 dB(A) (from 77 dB(A) to 66 dB(A)). Commenter then states the EIR’s conclusion that existing noise barriers within the region result in approximately a 6 dB(A) noise reduction is inappropriate. Throughout the region, existing noise barriers have varying heights and have been constructed using numerous techniques and materials. The comment supports the fact that the EIR conservatively assumes that existing noise barriers on average result in a 6 dB(A) noise reduction. MTC and ABAG took a deliberately conservative approach to considering the effects of noise barriers in order to avoid understating potentially significant impacts; this conservative approach was taken throughout the EIR.
- C172-20: The commenter states that Alternative 4 is the superior alternative, in the commenter’s view. Alternative 4 performed worse than other alternatives in many impact categories, as summarized in the Draft EIR on pages 3.1-146 through 3.1-148. The comment notes that Alternatives 3, 4 and 5 were penalized by including an additional peak period Bay Bridge toll. However, Alternative 5, which included said toll, actually performs the best overall in the Draft EIR analysis. As the commenter points out, the differences between alternatives are extremely small, and the commenter is correct in noting that when doing 28-year planning and impact analysis, the differences between most alternatives in many cases is so small as to be within a likely margin of error of the tools used for the analysis.
- C172-21: The commenter is correct that Alternative 4 performs more poorly in impacts associated with transportation impacts, and performs relatively well compared to the other alternatives regarding land use impacts.
- C172-22: The commenter states that “Alt. 4 ... has interactions with the counties surrounding the 9-county [Bay Area]”. It is unclear as to what “interactions” the comment refers to or why these “interactions” would not occur in the other Alternatives. As a simplification, UrbanSim ignores neighboring counties, states, and countries when distributing growth within the Bay Area. This approach is taken for each of the five alternatives. MTC and ABAG do not think this assumption has any differential impact on Alternative 4.
- C172-23: As noted on page 2.2-18 of the Draft EIR, the MTC travel model provides estimates of vehicle miles traveled (VMT) by speed category to the California Air Resources Board’s emissions estimation software (EMFAC2011). The EMFAC2011 estimates reflect assumptions about changes in future fleet mix. As such, the Draft EIR analysis explicitly

considers changes in the fleet mix. The CARB website contains an interactive tool⁷ that provides information on the vehicle types included in EMFAC2011.

- C172-24: See Master Response D.1 regarding the emissions analysis.
- C172-25: Many of these underlying trends are highly variable. The proposed Plan incorporates some of these factors in its population projections (see Master Response B.1) but others such as tax rates and health care costs are uncertain and it would be speculative to plan around them.
- C172-26: Commenter's opposition to all of the alternatives is acknowledged. The decision-makers will consider this comment in considering the merits of the proposed Plan and alternatives evaluated in this EIR.

Letter C173 Karen Westmont (5/16/2013)

- C173-1: The comment states that by assuming the same share of people commute into the region in 2040 as in 2010, the proposed Plan results in more expensive housing, increased congestion and emissions, and that long-distance commuters will not be considered in the air quality analysis that is done at a regional or air basin level. The analysis in the Draft EIR for both transportation impacts and air quality includes the impact of people who commute in to the region.

The proposed Plan, as described in the Draft Plan, page 102 and 116, is anticipated to result in increased housing and transportation costs in the region compared to today's levels for all households. Alternative 4, which includes a higher number of new housing units, does, as the comment suggests, result in a very slightly lower share of income going to housing and transportation. It should be noted that the proposed Plan does not cap the level of development that is authorized in the San Francisco Bay Area. The proposed Plan does not limit the land use control of local jurisdictions and, therefore, jurisdictions could exercise their discretion to authorize housing development at a rate that exceeds the level forecasted in the proposed Plan. See Master Response A.1 regarding local land use control.

The comment goes on to state the California Housing and Community Development (HCD) Agency did not correctly calculate the housing need for the region because it is based on existing homes. This comment is not on the Draft EIR, nor is it one the proposed Plan. The housing allocation is the subject of a different process, the Regional Housing Needs Allocation. While the RHNA must, as per SB 375, be consistent with the SCS, the SCS is independent of RHNA.

Letter C174 Beverly Wood (5/16/2013)

- C174-1: Please see Master Response C regarding the request to extend the public comment period.

Letter C175 Carol Brandt (3/4/2013)

- C175-1: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the

⁷ <http://www.arb.ca.gov/emfac/>

Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

Letter C176 Margery Entwisle (5/13/2013)

- C176-1: Please see Master Response D.2 on the connection between high-density housing near transit and reduced greenhouse gas emissions.
- C176-2: Please see Chapter 2.12 of the Draft EIR and Master Response G regarding water supply. In addition, it is important to recognize that the Plan will not, in itself, create population growth, but is rather a regional strategy to accommodate the region's projected population and job growth in an equitable and efficient manner in partnership with local governments.

Letter C177 Devilla Ervin (5/16/2013)

- C177-1: See Master Response F on issues of displacement.
- C177-2: Commenter's support for Alternative 5 is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.
- C177-3: Commenter is correct that the Draft EIR concluded that Alternative 5 is the environmentally superior alternative. Commenter's support for Alternative 5 is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C178 Sue Hestor (4/28/2013)

- C178-1: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR, including the outreach efforts to inform the public of the availability of the Draft EIR and the libraries to which the document was sent.
- C178-2: Please see Master Response E and chapter 2.5 (Climate Change and Greenhouse Gases) of the EIR regarding sea level rise.

Letter C179 Bill Long (5/14/2013)

- C179-1: Under SB 375 and the Scoping Plan, MTC and ABAG must reduce GHG emissions through integrated land use and transportation planning. Thus MTC and ABAG followed CARB direction to exclude other policy initiatives, such as increases in fuel efficiency and low Carbon fuels, in its modeling for Criterion 2.5-1 which is the SB 375 GHG emissions reduction target. Please see Master Response D.1 regarding the greenhouse gas emissions included in analysis for the SB 375 target.
- C179-2: Please refer to the response C179-1.

Letter C180 Libby Lucas (5/14/2013)

- C180-1: Commenter's support for Alternative 4 is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.
- C180-2: Potential impacts of the proposed Plan on the transportation system are evaluated in Chapter 2.1 of the Draft EIR, potential impacts related to public services are covered in Chapter 2.14, and impacts related to utilities are covered in Chapter 2.12.
- C180-3: The commenter suggests that the tsunami analysis for the proposed Plan should include findings from a 1984 United States Army Corps of Engineers tidal study and combine it with anticipated higher sea levels associated with global warming to analyze potential tsunami hazards. The referenced 1984 tidal study examined tidal records from 1855 to 1983 to identify increases of annual maximum tides over time and the relatively infrequent tide events (e.g. 100-year tidal events). The study does not evaluate tsunami hazards. As stated in the Draft EIR beginning on page 2.5-61, there are numerous transportation projects proposed under the plan that would be located in areas that could become inundated by sea level rise (see also Table 2.5-11 on page 2.5-62 for a list of specific projects that could become inundated by mid-century). There has been substantially more research on sea level rise and potential hazards within the Bay Area since the 1984 Army Corps study, and yet there is still much debate regarding the amount of sea level rise that can be anticipated in the future. However, Mitigation Measures 2.5(a) through (d) would require that planning for proposed improvements considers sea level rise and that adaptive management strategies be enacted to address the potential effects of a rising sea level including associated effects such as changes to flooding patterns and tsunami inundation areas.
- C180-4: The commenter asks why the proposed Plan does not include investments in padding along the highway in a number of locations, including Highway 101, I-80 in Berkeley and in Marin. No project sponsors submitted projects including installing padding as part of the call for projects. However, one of the initiatives identified in the proposed Plan as a key MTC and ABAG priority work item is to evaluate adaptation strategies for the region to address the impacts of sea level rise. Such analysis will include identifying potential strategies, including infrastructure investments.
- C180-5: The commenter states that the proposed Plan includes many projects that are growth inducing and that the proposed Plan does not do enough to address greenhouse gas emissions. It is important to recognize that the Plan will not, in itself, create population growth, but is rather a regional strategy to accommodate the region's projected population and job growth in an equitable and efficient manner in partnership with local governments. Additionally, the proposed Plan included a robust project performance assessment, which included as assessment of emissions and potential growth-inducing aspects of new capital projects. See the Supplemental *Project Performance Report* for more information. See also Master Response D.2 regarding the connection between high-density housing near transit and reduced GHG emissions. See also chapter 2.9 (Biological Resources) of the EIR of potential impacts to marshes and other habitats and the mitigation measures proposed to address those impacts. See also Master Response A.3 regarding the programmatic nature of this EIR.
- C180-6: Implementing agencies for future second-tier projects must address site-specific liquefaction issues. Also note that Mitigation Measure 2.7(b) which addresses this issue is tied to existing

regulations, namely the California Building Code, that are law and binding on responsible agencies and project sponsors. See Master Response A.3 regarding the level of specificity in this program EIR.

- C180-7: The commenter claims that “earthquake faults seem not sufficiently addressed with conservative design criteria.” As stated in the Draft EIR on page 2.7-18, “the 2010 CBC is based on the 2009 International Building Code (IBC) published by the International Code Conference. In addition, the CBC contains necessary California amendments, which are based on reference standards obtained from various technical committees and organizations such as the American Society of Civil Engineers (ASCE), the American Institute of Steel Construction (AISC), and the American Concrete Institute (ACI). ASCE Minimum Design Standards 7-05 provides requirements for general structural design and includes means for determining earthquake loads as well as other loads (flood, snow, wind, etc.) for inclusion into building codes.” Mitigation Measure 2.7(b) requires that all proposed improvements are designed and constructed in accordance with the “most recent version of the California Building Code (CBC)” and “shall comply with Chapter 16, Section 1613 of the CBC which provides earthquake loading specifications for every structure and associated attachments that must also meet the seismic criteria of Associated Society of Civil Engineers (ASCE) Standard 07-05.” The CBC is routinely updated and revised to reflect the latest seismic design research incorporating performance from earthquake events that occur from around the world. The CBC represents the most stringent seismic building code requirements in the United States.
- C180-8: The commenter is concerned with older floodplain maps that have not been updated by FEMA and that this allegedly represents a deficiency to the analysis. The analysis for this Draft EIR can only rely on approved FEMA floodplain maps; otherwise the analysis would be speculative. Future projects under the proposed Plan would nonetheless still be required to adhere to the local floodplain development requirements that are in effect at that time. Additionally, any final approved FEMA maps would be incorporated into local ordinances and planning elements as they are released. As stated in the Draft EIR on page 2.8-13, “construction standards are established within local ordinances and planning elements to reduce flood impedance, safety risks, and property damage.” In addition, “local flood control agencies and the U.S. Army Corps of Engineers have established extensive flood control projects, including dams and improved channels many of which continue to be repaired, constructed, and completed.” These flood control improvements occur throughout the planning area and would also include Santa Clara County and the tributaries mentioned in the comment where it is deemed necessary and effective. As such, with adherence to local, state and federal floodplain standards as required by Mitigation Measure 2.8(b), the proposed improvements would have a less than significant impact related to floodplain development.
- C180-9: The commenter notes that the Santa Clara County HCP did not include fisheries or Peninsula habitat conservation so the species lists are not as inclusive as they should be. The commenter further states that climate change may affect species and habitat distribution as well as species survival over the next 40 years. The Draft EIR is programmatic in nature and necessarily takes a broad approach to describing the environmental setting and identifying general types of impacts, without breaking down those broad types into the myriad potential project-specific impacts that might fall under a particular heading. The full list of special-status species potentially affected by proposed projects under the Plan can be found in Table H-1 in Appendix H of the Draft EIR. Furthermore, implementing agencies must comply

with CEQA prior to approving future second-tier projects. Also see Master Response A.3 regarding the level of specificity in this program EIR.

- C180-10: The commenter states that wildlife corridors should be accommodated by highways and that several Santa Clara County highway improvement projects should include underpasses or elevated crossings for wildlife. As noted in response B2-3, Mitigation Measure 2.9(e) requires site-specific analysis of regional, as well as local migratory corridors, and several other measures, including *construction of wildlife friendly overpasses and culverts, use of wildlife friendly fencing, and fencing of major transportation corridors in the vicinity of identified wildlife corridors* (emphasis added).
- C180-11: The commenter is concerned with highway upgrade impacts, specifically potential increases in non-native vegetation on serpentine grasslands and resultant increases in fire hazards. According to research conducted by the California Native Plant Society, “comparatively little is known about most invasive plants in California and their relationship to wildfire” (Lambert, et al., 2010). Regardless, proposed improvements would be required to implement Mitigation Measure 2.13(g), which require adherence to California Fire Code as well as compliance with Title 14 of the California Code of Regulations, Division 1.5.
- C180-12: The commenter states that chemical alteration in plants and creation of invasive hybrids “is [ex]acerbated by road expansion in and adjacent to wetlands” and that this impact should be assessed in the Draft EIR. The Draft EIR authors are unaware of any studies reporting that automobile pollutants directly cause chemical alterations in plants or contribute to the creation of hybrid plant species. Excess nitrogen deposition can, however, result in changes in species dominance, particularly in communities where nitrogen is naturally a limiting factor, such as serpentine soil communities or wetlands, due to resultant chemical alterations in soil properties that make specialized substrates more prone to invasions by non-native species that otherwise have a hard time competing on such soils. Excess nitrogen deposition can also result in changes in water chemistry that could have deleterious effects on aquatic life. In wetland systems, additional nitrogen can stimulate growth of invasive species such as cordgrass, which can hybridize with native species. However, in many cases the bulk of nitrogen loading in aquatic systems does not come from atmospheric deposition but is related to the hydrology of a system and sources include runoff from land, ground water, marine water, and wastewater effluent. The Bay Area Upland Habitat Goals Report⁸ included a relatively coarse-scale analysis of atmospheric nitrogen deposition throughout the Bay Area, which shows that, in general, tidal marshes around the San Francisco Estuary are subject to the lowest dry atmospheric nitrogen deposition rates. The report also finds that tidal marshes are only moderately sensitive to nitrogen deposition. At this point, however, there is little research available on the effects of atmospheric nitrogen deposition on specific species, and site-specific nitrogen budgets are for the most part unknown. Therefore, it would be speculative to assert that atmospheric nitrogen deposition in the Bay Area is a primary driver for invasion of local marshes by non-native cordgrass or giant reed. In addition, Plan Bay Area is intended to reduce greenhouse gasses per SB 375 and, as noted in Chapter 2.5, Climate Change, of the Draft EIR, implementation of the proposed Plan is expected to result in overall land use and transportation-related decreases in greenhouse gas emissions from existing conditions. Therefore, the project would not contribute considerably to any such impact, were it to occur.

⁸ Available online: <http://www.bayarealands.org/reports/>

The commenter further states that highway earthmoving equipment can contribute to the spread of invasive species to stream systems. The Draft EIR recognizes the potential for construction to spread invasive plant species in riparian and other sensitive communities on pp. 2.9-54 and 2.9-56. The mitigation measures proposed for impacts on riparian communities would include consideration of invasive species control as a necessary component of avoiding and minimizing impacts. In addition, where wetland and stream permitting is involved, such permits typically contain terms and conditions relating to controlling invasive species, as do compensatory mitigation plans. Please also note that implementing agencies must comply with CEQA prior to approving future second-tier projects.

- C180-13: The commenter asserts that the Draft EIR does not include linear impacts on riparian corridors. The results of the GIS-based analysis for PDA impacts on other waters (including streams and their associated riparian corridors) are expressed in linear feet and presented in Table H-5A of Appendix H of the Draft EIR. The results for transportation project impacts are expressed in the number of linear projects intersecting mapped streams since the actual footprint of the projects relative to the riparian corridors are unknown at this time (see Table H-5B of Appendix H of the Draft EIR). Please also note that implementing agencies must comply with CEQA prior to approving future second-tier projects.

Letter C181 Libby Lucas (5/21/2013)

- C181-1: The commenter notes that the libraries near the commenter were unable to locate the Draft EIR. Please see Section 1 of this Final EIR for a description of the outreach efforts to inform the public of the availability of the Draft EIR and the libraries to which the document is sent. The Draft EIR was sent to the libraries referenced by the commenter; their inability to locate the document was noted and MTC sent the commenter a paper copy of the Draft EIR. Please also see Master Response C regarding the request to extend the public comment period.
- C181-2: The commenter states that the Draft EIR is deficient because it does not address biological resources issues in Santa Clara County in sufficient detail. Please see Master Response A.3 regarding the level of specificity in this program EIR. See also response C180-9 regarding Santa Clara County biological resources.
- C181-3: The commenter states that the summation of wetland impacts in acreage and miles seems underestimated and not sufficiently site-specific. Please refer to response B17-6 regarding underestimation of wetland impacts and see Master Response A.3 regarding the level of specificity in this program EIR.
- C181-4: The commenter states that the Draft EIR is deficient in not discussing “no net loss policies” for wetlands. Please refer to response B17-23 for a discussion of this matter.

Letter C182 Deirdre O’Brien (5/15/2013)

This letter forwards Letter C98 from Lisa Culbertson. See responses to C98.

Letter C183 Greg Schmid (5/9/2013)

- C183-1: Please see Master Response B.1 regarding population projections.

Letter C184 Pamela Tapia (5/16/2013)

C184-1: Commenter's support for Alternative 5 is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

C184-2: Please see Master Response F regarding displacement.

Letter C185 Athena McEwan (5/8/2013)

This letter does not contain a direct comment on the EIR, but rather forwards a newspaper article and attached comments on the article. The article and the comments are each addressed as a single comment.

C185-1: Please see Master Responses D.2 on the connection between high-density housing near transit and reduced GHG emissions, D.1 on GHG emissions included in analysis for the SB 375 target, Draft EIR Chapter 2.2 on air quality impacts and mitigations, Chapter 2.10 on visual resources, and Chapter 2.14 on public services. The financial costs of the proposed Plan are beyond the scope of an EIR.

C185-2: Many of these comments are not on the EIR, although those in support of the No Project alternative are noted. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt. Bob Silvestri's comments are addressed in the responses to his letters, numbered C26 and C156.

Letter C186 Chester Martine (5/16/2013)

C186-1: In response to Query 1-1, as explained on page 1.1-9 of the Draft EIR, "For analytic purposes in this EIR, 2010 is the base year (existing conditions), except for greenhouse gas emissions where 2005 is the base year for one criterion to demonstrate compliance with SB 375." See Master Response D.1. In some cases, the latest mapped data and related facility or public service information were used, usually from 2012 (for example, air quality, air basin boundaries, PDA boundaries, major road facilities, transit lines and areas served by transit, bicycle facilities, urbanized land and open space, regional parks and open space, levees and non-engineered berms, documented sensitive biological resources, critical habitat, scenic resources, water supplies, landfill capacities, and wastewater treatment capacity). Baseline environmental data for geology, seismicity, soils and farmland capabilities, flooding and wildland fire hazards were the most current available from responsible agencies and State databanks.

C186-2: In response to Query 1-2, the term "implement" means the requirements of federal and state law and implementing regulations that have been enacted, adopted and chaptered as law and existing local land use policies apply to the No Project. The EIR assumes such existing laws and policies will be implemented and are, therefore, made part of the No Project analysis and modeling performed for the No Project alternative.

In response to Query 1-3, the regulatory context includes existing regulations currently in force, which is fully consistent with CEQA and State CEQA Guidelines.

C186-3: In response to Query 1-4, the EIR describes existing regulations and what it means to implement them in the regulatory setting sections in each chapter; this same regulatory information is applicable to the alternatives. In response to Query 1-5, this EIR does state

that in the No Project alternative urban boundary lines would expand at historic rates. This EIR relies on information compiled by MTC and ABAG on historical changes in urban boundary lines, as defined in Section 2 of the Final EIR, and records on average annual annexation of land to cities for urban development. The urban boundary lines are assumed to expand at an historic rate under the No Project alternative because the alternative is designed to reflect a business-as-usual vision for the future.

- C186-4: See responses to Letter B6 regarding urban growth boundary definitions. In response to Queries 1-6 and 1-7, the EIR does include information on what it means to implement existing regulations in the regulatory setting sections for each chapter. Similarly, the EIR describes the existing environmental setting for each resource area evaluated in the EIR. The existing environmental setting as discussed throughout the EIR constitutes the existing environmental setting for the purposes of the alternatives analysis.
- C186-5: The NOP describes the proposed Plan and MTC and ABAG's intention of preparing an EIR; it does not provide detail on existing land use policies. The EIR provides those details; see responses C186-1 through C186-4.
- C186-6: The NOP does not describe existing land uses or existing land use policies; rather, it expresses the intent of MTC and ABAG to prepare an EIR and elicits comments that would help them define the scope of the EIR. See also response C186-3.
- C186-7: In response to Query 1-10, the EIR includes a discussion of existing land use policy in the regulatory setting section of Chapter 2.3. See Master Response A.1 for additional information on local control over land use.
- C186-8: In response to Query 1-11, the EIR does refer to regulations that affect local land use policy in the regulatory setting section of Chapter 2.3. This discussion would apply to the context for the No Project alternatives analysis. Page 1.1-9 of the Draft EIR explains that, "The No Project alternative consists of...the existing 2010 land uses plus continuation of existing land use policy as defined in adopted general plans, zoning ordinances, etc. from all jurisdictions in the region..." In response to Query 1-12, this EIR did not extensively analyze whether existing land use policies and land use regulations at the local level conform to the 2010 Clean Air Plan; the focus of this EIR is on whether, in this instance, the proposed Plan would conform to the Clean Air Plan, and this subject is evaluated under Impact 2.2-1(b). However, in Chapter 3.1, p. 3.1-34, the Draft EIR notes that, "As [the No Project] alternative assumes continuation of currently-adopted general plans through 2040, there is a potential for this alternative to be inconsistent with goals and objectives of the CAP. For example, the more dispersed pattern of growth does not promote communities where people can walk, bike, or conveniently use transit, which is a key objective of the CAP..."
- C186-9: In response to Query 1-13, the EIR describes existing land use regulations and existing land use policies that have an effect on land use in the regulatory setting section of Chapter 2.3. In response to Query 1-14, the housing element is part of the General Plan, and General Plans are included in the discussion of local control mechanisms in the regulatory settings section of Chapter 2.3. In response to Query 1-15, the reference to Government Code Section 65300 et. seq. does include State Housing Law and requirements for housing elements. To expand on this section in the interest of clarity and complete disclosure, the following sentence is added to the last paragraph on page 2.3-27; see Section 2 of this Final EIR as well:

... Additional information about General Plan housing elements and update cycles is available on the California Department of Housing and Community Development website's housing element page:

<http://www.hcd.ca.gov/hpd/hrc/plan/he/>.

- C186-10: MTC and ABAG believe that the regulatory setting sections for each of the chapters in Part II of the EIR contain all of the relevant information needed for this programmatic assessment under CEQA. The discussion of the regulatory setting sections for each of the chapters in Part II of the EIR applies to all alternatives analyzed in the EIR, including the No Project alternative.
- C186-11: See response C186-8.
- C186-12: MTC and ABAG acknowledge and agree generally with this historical information presented in Facts 1-30 through 1-36.
- C186-13: In response to Query 1-17, this EIR establishes a regulatory setting based on federal, State and local regulations in place at the time preparation of this EIR was initiated. MTC and ABAG agree with the statement in Fact 1-40 that local governments have done much to spur affordable housing development. Existing local policies to spur development of affordable housing are part of the existing regulatory setting.
- C186-14: See Master Response B.2: Feasibility of the proposed Plan's Priority Development Areas.
- C186-15: MTC and ABAG believe that this EIR correctly defines the No Project alternative. The EIR assumes that existing regulations will be implemented, but also assumed that certain changes are also foreseeable under the No Project alternative such as a continued expansion of urban boundary lines based on historic rates. This assumption is not inconsistent with the idea that local General Plans and land use regulations would continue to be implemented. The idea is that the No Project alternative represents a continuation of historical trends, changes in "urban footprints" based on records of average annual annexation of land to cities for urban development.
- C186-16: See response C186-15, above. Many jurisdictions in the Bay Area have enacted policies and regulations to promote infill development while, at the same time, planning for appropriate expansion on to development land adjacent to the city limits. Concord is one clear example of this: the city has a robust infill incentive program; it also has been planning for the redevelopment of the Concord Naval Weapons Station. Both types of development would occur under the No Project alternative. As a programmatic assessment for the nine-county region, this EIR relies on "business as usual" analysis and projections prepared by ABAG. MTC and ABAG believe the information compiled and analyzed in this EIR for the No Project alternative is consistent with the parameters for the No Project analysis established in CEQA and State CEQA Guidelines.
- C186-17: The requested modification of the No Project alternative makes a policy assumption that MTC and ABAG does not believe is appropriate: to wit, that local governments would plan for growth in PDAs once zoning by such governments permits such PDAs. Under the No Project alternative, it would be speculative to presume what specific changes in local General Plans would be made. MTC and ABAG respectfully prefer the definition of the No Project

alternative presented in this EIR as appropriate for this programmatic assessment of the proposed Plan.

- C186-18: These tables accurately summarize the differences between the alternatives that were analyzed in detail, and the characteristics of the alternatives that emerged from the screening process described on pg. 3.1-2. These tables are meant as a summarizing visual aid for the reader and do not replace the definitions of the alternatives on pages 3.1-5 through 3.1-8.
- C186-19: See response C186-10. Per CEQA Guidelines and as explained on p.1.1-9 of the Draft EIR, “As with the evaluation of the proposed Plan, this EIR evaluates impacts of the No Project alternative and the other alternatives in 2040, the horizon year for the proposed Plan.”
- C186-20: This is explained on p.3.1-5 in the definition of the No Project alternative: “Express Lane projects in MTC’s regional network are listed as committed but technically are uncommitted; all of the MTC Network Express Lane projects are therefore excluded from the No Project alternative (VTA’s Express Lane Network is a fully committed project and included in every alternative).” This statement includes a footnote that further explains: “The region’s two Express Lane networks—MTC’s regional network and VTA’s network—are each viewed as a project made up of individual project segments. Unless the entire network is fully funded and committed, the entire network, or ‘project’, is uncommitted. As a result, MTC’s Express Lane Network is an uncommitted project; VTA’s Express Lane Network is a fully committed project.”
- C186-21: MTC and ABAG acknowledge the comment about the exemplary control measures in the Clean Air Plan.
- C186-22: As noted in prior comments, neither MTC nor ABAG, nor the BAAQMD, have authority to control local land use. While the control measure cited does call for promoting land use patterns that support mixed use, transit-oriented development, local jurisdictions would retain local land use authority. Therefore, the control measure does not compel local jurisdictions to take any specific actions; MTC and ABAG believe it was proper to include continued expansion of urban boundary lines based on historic rates within the No Project alternative. See Master Response A.1 for additional information on local control over land use.
- C186-23: MTC and ABAG respectfully disagree with the need for a new model run for the No Project alternative for the reasons presented in Response C186-22. MTC and ABAG believe it is reasonable and foreseeable to conclude local jurisdictions will continue to expand urban boundary lines based on historic rates under the No Project alternative.
- C186-24: MTC and ABAG believe that the tables in Chapter 3.1 accurately reflect the alternatives analysis undertaken and inform decision-makers of the environmental consequences of the alternatives. These alternatives do reflect long term trends and provide comparisons for the 2040 horizon year. RHNA programs are for a shorter time frame, and it would be speculative to assess in any detail what the details effects of five additional cycles of housing element updates might be. Instead, the alternatives analysis focuses on longer term trends as they would be affected by the policy interventions described for each alternative.
- C186-25: Correction noted and made in Section 2 of this Final EIR.

Letter C187 Peter Singleton (5/16/2013)

C187-1: See Master Response C regarding the request to extend the public comment period. In addition, the commenter claims that the Plan Bay Area is based on models, assumptions, forecasts and omissions that are “deficient and dishonest.” Those accusations are detailed in later comments by the commenter and responded to in detail below.

C187-2: The commenter claims that the public participation process associated with developing Plan Bay Area was inadequate. A portion of the information Mr. Singleton/Judicial Watch requested of MTC was publicly available prior to the Judicial Watch public records request dated March 13, 2013 (“Judicial Watch PRA request”). See response 187-5. In addition, a majority of the information requested on March 13, 2013 was provided prior to April 19, 2013, in accordance with the California Public Records Act (“CPRA”). The CPRA requires an agency to determine whether to comply with the request within 10 days of receiving the request. (Gov't Code § 6253(c).) As shown in the attachments to Mr. Singleton's May 16, 2013 comment letter (“Singleton May 16 letter”), MTC responded on March 25, 2013. The tenth day was March 23, a Saturday; MTC responded on the first succeeding business day. The CPRA allows a responding agency to extend the deadline for an additional 14 days for various reasons. As shown in the attachments to Singleton's May 16 letter, in its March 25, 2013 letter, MTC extended the deadline for the 14 days for the articulated reasons as are permitted by Government Code § 6253(c). The CPRA also instructs the responding agency to state the date and time when records will be made available. (*Id.*) On April 8, 2013, fourteen days after its March 25 letter, MTC responded in a twelve page letter with answers and links to material for the majority of the items requested in the Judicial Watch PRA request. MTC also stated that the remaining material, constituting approximately 1250 pages would be available two weeks hence. See attachment to Singleton May 16 letter.

The attachments to the Singleton May 16 letter clearly show that MTC complied with the CPRA in responding to the Judicial Watch PRA request. The request was several pages long and included dozens of categories and subcategories, including many questions that required a narrative response. MTC received the request on March 13, 2013, and notified Mr. Singleton that it would require an additional 14 days to respond, as permitted by the CPRA. At the end of the 14-day period, MTC responded with a lengthy and substantive letter, specifically addressing each of Judicial Watch's numerous questions and requests. This letter also provided a substantial amount of responsive documentation in the form of web links, which contained much of the requested information. Thus, Mr. Singleton in fact had the majority of the responsive information to a voluminous request within 24 days, a statutorily permitted timeframe. Furthermore, as noted above, the MTC April 8 letter estimated that there were approximately 1250 pages of additional responsive documents which would take approximately two weeks to gather, and provided Judicial Watch with the option of either paying for copies of the documents or sending representatives to MTC's offices to review the documents. As the Singleton May 16 letter discusses, MTC and Judicial Watch disagreed about the copying charge for these additional documents; however MTC did in fact, on the same day Judicial Watch came to MTC to review the documents, provide the documents to Judicial Watch in the form it desired for a nominal amount. The CPRA permits agencies to provide documents past the 24 day “deadline” and MTC did so with all deliberate diligence, using limited available personnel resources.

See Master Response C for additional information regarding the comment period schedule.

C187-3: See response C187-2.

- C187-4: The 45-day public comment period provided on the Draft EIR complies with CEQA. (Pub. Resources Code § 21091.) The fact that commenter filed a PRA request does not render the public comment period legally inadequate. See also Master Response C regarding requests for extension of the public comment period.
- C187-5: MTC has made modeling data and results available throughout the Plan Bay Area process. MTC has made information on model assumptions, methods, and results available to the public in a clear and transparent manner through posting on its website⁹, presentations in public meetings, and presentations at open public forums hosted by SPUR (a nonprofit organization focused on regional planning issues). To further communicate the model structure, parameters, and sensitivities, MTC has provided highly technical information¹⁰, as well as presented model overviews to non-technical audiences¹¹. Nearly all these materials were posted to the website or presented in public meetings well before the Judicial Watch PRA request, or in the cases of footnote 1(c) and 2(f), within the 24 day period following March 13, 2013.
- C187-6: Consistent with SB 375, the GHG emissions target CARB assigned MTC and ABAG requires reductions, when measured on a per capita basis relative to 2005, beyond those achieved by “new vehicle technology and by the increased use of low carbon fuel” (SB 375, Section 1(c)). See also Master Response D.1 regarding GHG emissions for SB 375. As such, for the purposes of SB 375, MTC and ABAG must estimate carbon dioxide emissions assuming a hypothetical future in which new vehicle technologies and the increased use of low carbon fuel are not present. This calculation is performed using CARB’s EMFAC2011

software and includes an estimate of effective miles per gallon (this quantity is referred to as “SB 375 MPG” henceforth).

When assessing the environmental impact of the proposed action, MTC and ABAG assume a policy future in which new vehicle technology and the increased use of low carbon fuel do exist. The emissions are also estimated using CARB’s EMFAC2011 software and include a separate estimate of effective miles per gallon (“expected MPG” henceforth).

For each scenario, therefore, MTC and ABAG have two estimates of effective miles per gallon. One is the expected future year value, expected MPG, and is used as part of the emission estimation process that is the basis for assessing the environmental impact of the proposed action. The second is the hypothetical value, SB 375, which is used as part of the carbon dioxide estimation process that is the basis for MTC and ABAG’s SB 375 GHG target. The only purpose of this hypothetical, second value is for computing MTC and ABAG’s SB 375 GHG target.

The table presented on page 14 of the comment letter is, as noted in footnote 16 on page 15 of the comment letter, derived from an internal MTC email documenting the results of a travel model simulation. The internal MTC email included both the expected MPG and the SB 375 MPG; the comment includes only the SB 375 MPG, which is misleading.

MTC and ABAG’s use of these two separate MPG estimates for two separate purposes is not a secret. EMFAC2011 outputs both of these numbers for this very reason.

MTC and ABAG cannot rely on state-mandated changes in vehicle technology and increased use of low carbon fuel to meet the region’s SB 375 target. SB 375 makes this clear in the text quoted above.

The commenter states that the model runs include the undisclosed results from running a post-processor that evaluated the impact of Pavely I and the Low Carbon Fuel Standard. That is not the case. EMFAC2007 and 2009 both used a post-processor to evaluate the impacts of Pavely I. EMFAC2011 does not use a post-processor. The post-processor was for older versions of the EMFAC model. For additional information on EMFAC2011, see <http://www.arb.ca.gov/msei/modeling.htm>.

C187-7: In May of 2011, MTC staff presented Plan Bay Area financial assumptions, including assumptions for the gas tax, to the Partnership Technical Advisory Committee (PTAC), the Regional Advisory Working Group (RAWG), and the Policy Advisory Council for review and input. As noted during the May presentations, the projections for fuel price and consumption were derived from a model based on a standardized set of assumptions during the 28-year period.

The commenter contends that gasoline usage by passenger vehicles will decline by 37 percent per VMT (32 percent overall), and as a result total gas tax revenues will be 32 percent less in real terms in 2035 than in 2010. In order to obtain a 37 percent decrease in gasoline usage by passenger vehicles from 2010 to 2035, one would need to assume that annual VMT will not change from 2010 to 2035. In addition, the commenter questions

whether fuel prices will keep pace with PBA's standard 2.2 percent rate of inflation. Table 1 examines the real growth in retail gasoline prices, after adjusted for inflation.

TABLE 1: REAL GROWTH IN FUEL PRICE

<i>Year</i>	<i>Actual Price Per Gallon, nominal</i>	<i>Actual Price Per Gallon, 2001 \$</i>	<i>Real Growth</i>
2001	\$1.68	\$1.68	
2002	\$1.56	\$1.52	-9%
2003	\$1.88	\$1.79	17%
2004	\$2.17	\$2.00	12%
2005	\$2.52	\$2.24	12%
2006	\$2.86	\$2.45	9%
2007	\$3.12	\$2.60	6%
2008	\$3.56	\$2.86	10%
2009	\$2.73	\$2.20	-23%
2010	\$3.14	\$2.50	13%
2011	\$3.86	\$2.98	19%
2012	\$4.08	\$3.08	3%

Sources:

Fuel Prices -- U.S. Energy Information Administration, California All Grades All Formulations Retail Gasoline Prices (Dollars per Gallon)

CPI -- California Department of Finance, California-All Urban Consumers, formulated from U.S. Bureau of Labor Statistics (BLS)

The commenter contends that financial models only account for Pavley Phase I through 2020, and ignore the continuing impact of Pavley Phase I on decreases in fuel consumption. The PBA fuel consumption forecast was derived using both MTC's travel demand model and the EMFAC 2007 forecasting software. (EMFAC2011 was not yet adopted when the revenue assumptions were developed.) EMFAC 2007 is an emission inventory model that calculates emission inventories for motor vehicles operating in California. MTC derived its consumption forecast by making assumptions regarding increases in the fuel efficiency of the vehicle fleet. The Plan Bay Area fuel consumption forecast assumes full implementation of Pavley Phase I and adherence to the Low Carbon Fuel Standard. The result of the inclusion of Pavley Phase I and the Low Carbon Fuel Standard is an expectation that statewide gasoline consumption will steadily decline until 2020 while the vehicle fleet becomes more fuel efficient, and that gasoline consumption will slowly grow at a constant long-term rate as VMT continues to rise in response to growth in population and employment.

The commenter contends that the proposed Plan mitigates impacts of declining fuel consumption by overstating the growth in retail gas prices. In response to SB 375, the Regional Targets Advisory Committee recommended MPOs use consistent assumptions for fuel price in their modeling and planning initiatives. The specific fuel price assumptions were derived based on the $\frac{3}{4}$ -point between the U.S. Department of Energy's low- and high-end forecasts, plus a 25-cent surcharge to account for fuel generally being more expensive in

California. See *Technical Supplementary Report: Predicted Traveler Responses*, Page 37 for additional information

The commenter questions PBA fuel price forecasts by comparing the forecasts to a publication from the California Energy Commission. As previously noted, fuel prices were standardized and reflective of price forecasts from the U.S. Department of Energy. In addition, the CEC's fuel price forecast uses 2011 as a base year, whereas PBA uses 2009. According to the U.S. Energy Information Administration, the average annual retail price per gallon of gasoline in California in 2009 was \$2.725, and \$3.863 in 2011 (42% higher than 2009). The CEC uses 2011 as a base for their analysis and forecasts the real growth of gasoline price as a percentage of the 2011 price per gallon.

Table 2 identifies the 2011 price per gallon, as reported by the U.S. Energy Information Administration, and compares the CEC's high and low gasoline price forecast to PBA's gasoline price forecast.

TABLE 2: GASOLINE PRICE FORECASTS, REAL TERMS (2011 \$), PERCENT OF 2011 RETAIL PRICES

<i>Year</i>	<i>CEC "Low" Forecast % of Actual 2011 Price</i>	<i>CEC "Low" Forecasted Price Per Gallon, 2011 \$</i>	<i>CEC "High" Forecast % of Actual 2011 Price</i>	<i>CEC "High" Forecasted Price Per Gallon, 2011 \$</i>	<i>PBA Forecast % of Actual 2011 Price</i>	<i>PBA Forecasted Price Per Gallon, 2011 \$</i>
2011	100.0%	\$3.863	100.0%	\$3.863	100.0%	\$3.863
2013	102.5%	\$3.958	110.1%	\$4.252	87.4%	\$3.376
2014	103.4%	\$3.994	113.9%	\$4.400	92.3%	\$3.565
2015	104.6%	\$4.042	116.6%	\$4.505	97.4%	\$3.763
2016	104.3%	\$4.030	117.4%	\$4.537	103.0%	\$3.978
2017	103.7%	\$4.006	118.0%	\$4.558	108.7%	\$4.199

2030	98.8%	\$3.815	128.1%	\$4.947	136.8%	\$5.285

The commenter questions the impacts Pavley Phase II will have on the fuel forecasts, and questions the omission of Pavley Phase II in PBA. Pavley Phase II was not included in MTC's fuel price and fuel consumption forecast for PBA due to its introduction in 2012.

- C187-8: The commenter claims that the Draft EIR is deficient for not including Pavley II (also referred to as the CARB Advanced Clean Car Standards) in its analysis. Although Pavley II received final approval in December 2012, it was not adopted in time to be integrated into the modeling tools used for the analysis. CARB has yet to integrate Pavley II into EMFAC, and EMFAC is the emissions model all MPOs in the state are required to use to estimate emissions. The Draft EIR clearly states that the Advanced Clean Car Standards are not included in EMFAC2011, and if they had been included emissions would be lower than those shown using EMFAC2011. The Draft EIR is therefore conservative in its analysis of the environmental impact. However, it is important to note that for Criterion 2.5-1, the SB 375 GHG emissions reduction target, the benefits of Pavley I, Pavley II (Advanced Clean Car Standards) and the Low Carbon Fuel Standard cannot be included as part of the emissions reductions calculation. See Master Response D.1 regarding GHG emissions for SB 375.
- C187-9: See Master Response D.1 regarding GHG emissions for SB 375. The commenter also claims that MTC and ABAG will state that the analysis reasonably relied on EMFAC2011 for the emissions analysis. That is correct. MTC, and all other MPOs in California, are required to use EMFAC for emissions analysis. EMFAC2011 was developed by CARB and approved by US EPA. It is MTC's opinion that EMFAC2011 is the best and most appropriate tool available to estimate emissions.
- C187-10: See Master Response D.1 regarding GHG emissions for SB 375. SB 375 provides:
- Greenhouse gas emissions from automobiles and light trucks can be substantially reduced by new vehicle technology and by the increased use of low carbon fuel. However, even taking these measures into account, it will be necessary to achieve significant additional greenhouse gas reductions from changed land use patterns and improved transportation. Without improved land use and transportation policy, California will not be able to achieve the goals of AB 32.
- (SB 375, Stats. 2008, ch. 728, § 1(c) [uncodified legislative findings].)
- C187-11: Based on the above and related statutory directives included in SB 375, CARB prepared regional targets for reductions in GHG emissions from the automobile and light truck sector for 2020 and 2035, respectively. The CARB targets for the San Francisco Bay area are 7% and 15% respectively. In developing these targets, CARB expressly stated that the "CO₂ emissions... do not include reductions from Pavley and LCFS regulations." (See CARB's Proposed SB 375 Greenhouse Gas Targets, <http://arb.ca.gov/cc/sb375/mpo.co2.reduction.calc.pdf>.) Therefore, consistent with SB 375 and the SB 375 targets established by CARB, state MPG regulations were not included in MTC and ABAG's GHG modeling to evaluate the proposed Plan's consistency with the CARB's SB 375 GHG reduction targets for the San Francisco Bay Area. The commenter asks how SB 375 permits MTC and ABAG to (1) use models that fabricate data and produce results that are false; (2) use models that have multiple values for a single variable that must be consistent in its use throughout the model for the model to produce valid results, and (3) fail to disclose the full results of the modeling to the public. These statements are all false.

MTC and ABAG use the best modeling tools available. The commenter specifically asks about the miles per gallon values, which come directly from EMFAC2011, the CARB-developed and federally approved emissions model for California. See response C187-6. MTC and ABAG did disclose the emissions modeling results used for the Draft EIR analysis for Chapters 2.2 (Air Quality) and 2.5 (Climate Change). In Chapter 2.5, the Draft EIR specifically identifies the impact Pavley has on GHG emissions, as Criterion 2.5-1 does not take Pavley-related emissions reductions into account while Criterion 2.5-2 does. The EMFAC2011 outputs for other criterion pollutants and particulate matter do not differentiate with or without Pavley.

- C187-12: The commenter questions MTC and ABAG’s review and disclosure process. MTC and ABAG conducted thorough and thoughtful analysis and disclosed all data used in the analysis. In addition, MTC made significant amounts of additional data available through Supplemental Reports, technical reports and background material, and in response to requests and questions throughout the process. The RTAC guidelines are nonbinding. MTC and ABAG will consider RTAC guidelines related to disclosure of model deficiencies in the future; however, MTC and ABAG feel the level of disclosure for Plan Bay Area is more than sufficient. MTC released a significant amount of data and analysis regarding the travel model, which is the model tool RTAC’s guidelines focused on, including detailed model sensitivity analysis and calibration analysis. In addition, in the EMFAC2011 documentation, CARB identifies areas of improvement for future EMFAC models. See *EMFAC2011 Technical Documentation, Updated January 2013*, page 16.¹²
- C187-13: The commenter states that it is unquestionable and indisputable that MTC used the CARB-supplied postprocessor. That is not true. MTC did not use the postprocessor, as the postprocessor is for the 2007 and 2009 versions of EMFAC. EMFAC2011 does not have a postprocessor.
- C187-14: The commenter questions MTC and ABAG’s use of modeling software that commenter asserts is deficient. MTC and ABAG believe that EMFAC2011 is the best available emissions modeling tool. It is the tool required for use in evaluating the Plan by the federal government and state of California. MTC and ABAG know of no other tool that would be better or more appropriate for the analysis.
- C187-15: The commenter states that MTC and ABAG are fully aware of the deficiencies in the modeling software. See responses C187-14 and C187-12.
- C187-16: The commenter questions if MTC and ABAG are required to use EMFAC2011 for emissions analysis. MTC is required to use EMFAC2011 for emissions analysis. EMFAC2011 is the tool approved for use to support the Air Resources Board’s (CARB) regulatory and air quality planning efforts and to meet the Federal Highway Administration’s transportation planning requirements.

MTC and ABAG are aware that EMFAC2011 does not include the impact of CARB’s Advanced Clean Car Standards. That is clearly documented in the Draft EIR (pages 2.2-18 and 2.2-19). Page 2.2-19 of the Draft EIR notes that “it is anticipated that emissions in the future will be lower than those calculated by this current version of the EMFAC model (EMFAC2011)”.

¹² <http://www.arb.ca.gov/msei/emfac2011-technical-documentation-final-updated-0712-v03.pdf>

The RTAC guidelines quoted in the comment related to travel demand models on other modeling tools. The “other modeling tools” referenced are those used to adjust outputs of the travel models, not emissions models.

C187-17: This commenter summarizes a letter written by Thomas Rubin, which was directed towards the Plan Bay Area Air Quality Conformity Analysis. Responses have been provided below for the four main bullet points included in the commenter’s summary:

- The Draft Plan does include a significant emphasis on improving service quality for existing bus routes. In addition to upgrading local bus routes to bus rapid transit, implementing BART Metro to reduce heavy rail travel times, and converting Caltrain to a higher-speed electrified service, the Draft Plan directs \$500 million to the Transit Performance Initiative (TPI). This program achieves performance improvements in major transit corridors where current and future land use supports high quality transit; additionally, it can be used to fund transit fare reductions, should a local agency decide to allocate TPI funding for that purpose.
- With regards to transit ridership forecasts, refer to response C153-9.
- With regards to historical transit expansion project cost overruns, MTC acknowledges the comment. MTC’s cost projections are based on the best information available. The commenter fails to note that, like many transit expansion projects, highway expansion projects have also experienced cost overrun issues.
- With regards to gas tax revenue projections, refer to response C187-7.

MTC’s funding allocations for rail and buses has been unanimously upheld by the Ninth Circuit Court of Appeals in *Sylvia Darensburg v. Metropolitan Transportation Commission*, 636 F.3d 511 (9th Cir. 2011) (Noonan, J., concurring)

C187-18: See Master Response D.2 and the responses to Letter C26 from Bob Silvestri.

C187-19: The commenter claims that the analysis ignores the impact of the CARB Advanced Clean Car Standards. That is true. The Advanced Clean Car Standards were finally approved in December 2012, which was too late in the Plan Bay Area process to be integrated into the emissions or revenue analysis. Either way, the benefits of the Advanced Clean Car Standards in terms of CO₂ emissions reductions are not allowed to be counted towards the SB 375 required GHG emissions reduction targets. See Master Response D1.

Pavley 1 regulations were included in the analysis and reported to the public in both the Draft EIR *Chapter 2.2 Air Quality* analysis and the *Chapter 2.5 Climate Change* analysis. See responses C187-8 and C187-16.

EMFAC2011 includes analysis of CO₂ emissions both with and without Pavley and LCFS. The emissions analysis for criteria pollutants is reported with Pavley and LCFS as part of the baseline; there is no distinct “with and without” criteria emissions analysis.

See response C187-7 regarding the gas tax assumptions.

C187-20: Commenter’s support for the No Project alternative is acknowledged. The decision-makers will consider this comment in evaluating the advantages and disadvantages of the proposed

Plan and each of the alternatives analyzed in this EIR. Also see Master Response H regarding UrbanSim and subsidies.

- C187-21: This commenter states that Plan Bay Area requires regional redevelopment agencies because its high density housing mandates require large projects in suburban downtowns and that Plan Bay Area insists that it needs eminent domain powers to force landowners to sell. As specified in SB 375, local jurisdictions retain land use authority; see Master Response A.1 on local land use control.

The proposed Plan Bay Area neither requires nor advocates for a regional redevelopment agency, and does not call for eminent domain powers. The proposed Plan does support a new local revenue source that would be created through a newly authorized tax-increment financing authority to support locally controlled funding tools for affordable housing projects, critical infrastructure improvements, and economic development projects in locally designated areas. The housing distribution pattern encompassed in the proposed Plan is informed by local policies and thus is not a one size fits all approach. Instead, it recognizes the wide range of diverse communities and Priority Development Areas in the Bay Area from modest scale rural town centers to the regional centers encompassed within the downtowns of the region's three largest cities. Densities and related zoning for all local jurisdictions is determined at the local level including zoning for Priority Development Areas. Correspondingly, all Priority Development Areas are locally nominated.

- C187-22: This commenter describes analysis done by Economic & Planning Systems (EPS) for MTC and suggests that Plan Bay Area would require regional development agencies that would forcibly acquire land from unwilling sellers. See response C187-21. Also, the example from the EPS report, a document that is informational and was not created by MTC or ABAG, and will not be adopted by MTC and ABAG, describes some of the local impacts of eliminating redevelopment agencies and the potential benefits of replacing redevelopment funding once utilized for the redevelopment of existing urban areas. It provides a general illustrative example of how redevelopment financing works. It also describes a number of potential local, not regional actions that may be taken such as incentives and bonuses even if tax increment financing authorities are not reinstated in the region's communities as a replacement for local redevelopment authorities. See Master Response B.2 regarding the feasibility of the proposed Plan's Priority Development Areas.

- C187-23: The commenter requests consideration of a new alternative, the "Bay Area Citizens Transportation and Housing Alternative". Plan Bay Area included a robust process of developing alternatives over many rounds of visioning and alternatives analysis. See Chapters 1.2 and 3.1 of the Draft EIR regarding the alternatives screening and development process, which resulted in the creation of two alternatives designed by advocacy groups: Alternative 4 by home builders and land developers, and Alternative 5 by social equity and transit supporters. The commenter had the same opportunities as other individuals and organizations to propose this alternative during this process. Furthermore, an EIR need only include a reasonable range of alternatives that would avoid or substantially less any of the significant effects of the project; every conceivable alternative to a project need not be considered per CEQA Guidelines. That said, many elements of the proposed scenario are included in the range of alternatives assessed by this EIR. The decision-makers will consider the reasonable range of alternatives analyzed in the EIR as well as additional alternatives suggested by commenters in considering whether to adopt the proposed Plan or an alternative thereto.

- C187-24: The commenter claims that the No Project alternative was not fairly developed because it does not allow zoning changes from today's zoning. The No Project alternative by definition assumes that there are no changes in existing zoning. The No Project alternative is meant to represent today's general land use pattern; it is therefore appropriate to not include any changes in local zoning.
- C187-25: The commenter claims that the proposed Plan includes unlimited zoning increases. This is not true. The proposed Plan included specific increases in zoning in Priority Development Areas consistent with the place-types selected by the jurisdictions. The various alternatives evaluated in the Draft EIR include multiple land use policy and transportation policy and investment differences, all of which contribute to the differences in the environmental analysis between alternatives. See Chapter 3.1, pages 3.1-4 through 3.1-10 of the Draft EIR for a description of the various alternatives.
- C187-26: The comment claims that MTC and ABAG geared the outcome by the definition of the modeling alternatives. The alternatives are defined by a set of policies approved by the MTC Commission and the ABAG Executive Board as the proposed Plan and EIR alternatives. The zoning assumptions were not driven by the modeling; the modeling is simply a tool used to evaluate said policies. The quote included from the Regional Modeling Working Group simply states that a question was asked about the assumptions for zoning. The statement does not support the claims stated by the commenter.
- C187-27: The commenter claims that MTC and ABAG's conclusion that locating housing next to commercial space, and both next to transit, will lead to residents taking jobs and transit is wrong. See Master Response D.2 regarding TOD and GHG reductions.
- C187-28: See Master Response B.2 regarding the feasibility of the proposed Plan's Priority Development Areas.
- C187-29: The commenter states that "The Plan's supporting documents themselves admit that even now 80% or more of all people who are surveyed for their preference for housing express a preference for single family housing, and one of the Plan's own consultants on market demand, Karen Chapple admits that the Plan's assumptions for market demand are unrealistic and impractical."

No citation is provided to support the first part of the statement: "the Plan's supporting documents themselves admit that even now 80% or more of all people who are surveyed for their preference for housing express a preference for single family housing." The source of this statement is unclear. See the Forecast of Jobs, Population, and Housing on the One Bay Area website for additional information in support of the Plan's housing distribution.

The commenter also cites a quote from Karen Chapple, who assisted in developing the regional housing projection included in the Draft Plan, from an article in the San Francisco Public Press, to support the second part of the statement: "one of the Plan's own consultants on market demand, Karen Chapple, admits that the Plan's assumptions for market demand are unrealistic and impractical."

Only a portion of the quote cited in the footnote to the above statement is provided: "This is really a great idea, but it's just basically impossible to implement." The entire quote is as follows: "Without major change at the state and federal level," [Chapple] said, [Plan Bay

Area] “is really a great idea, but it’s just basically impossible to implement.” The article from which the quote was taken can be found here:

<http://sfpublicpress.org/news/2012-06/with-redevelopments-end-bay-area-cities-scramble-to-keep-grand-plans-alive>

In the complete quote shown above, Chapple notes that the Plan’s implementation is contingent upon state and federal changes. The Draft Plan indicates that changes to state and federal funding levels, and the replacement of redevelopment funding, are important to regional development. See Master Response H. Chapple’s quote does not indicate that market demand is insufficient to support the growth anticipated in the plan, but that current policies mechanisms may not provide adequate support to realize this growth.

It is also worth noting that the Draft Plan addresses a nearly 30 year time frame and as such takes into account trends in demand, as well as potential policy changes that will advance the region toward and transportation and land use pattern that meets the region’s greenhouse gas emissions reduction target.

See Master Response B.2 regarding PDA Feasibility.

- C187-30: This commenter asserts that Plan Bay Area states a need for government subsidies and eminent domain powers encompassed in proposed new regional development agencies. Plan Bay Area neither requires nor advocates for a regional redevelopment agency. Plan Bay Area does not call for eminent domain powers. Plan Bay Area does support a new local revenue source that would be created through a newly authorized tax-increment financing authority to support locally controlled funding tools for affordable housing projects, critical infrastructure improvements, and economic development projects in locally designated areas. Until 2012, Bay Area jurisdictions could count on over \$1billion per year in local tax increment financing to support affordable housing projects, critical infrastructure improvements and economic development projects in locally designated redevelopment areas. See Master Response A.1 for more information on local land use control and Master Response H for more information regarding subsidy analysis.
- C187-31: The areas of concern articulated in the comment—the Plan’s definition of “Communities of Concern”, its characterization of housing preferences, and its principles—are not relevant to the two laws cited by the commenter, California Proposition 209 and the 14th Amendment of the United States Constitution.
- The language in the Draft Plan that caused offense to the commenter— references to the housing preferences of Latinos and Asians generally and the greater likelihood of residing in multigenerational housing among these groups specifically—will be modified in the revised Plan to focus on the underlying issues related to these trends, such as household formation patterns and immigration.
- C187-32: See response C187-17.
- C187-33: See Master Response D.2 regarding TOD and GHG reductions.
- C187-34: The commenter claims that the differences in GHG emissions reductions between the proposed Plan and the No Project alternative are negligible and do not justify

implementation of the Plan. The No Project alternative does not meet the SB 375 GHG emissions reduction targets. Regardless of the amount of difference in reductions between the proposed Plan and the No Project alternative, the latter does not meet the basic objectives of the Plan or comply with SB 375. The commenter also continues to claim that the analysis did not correctly account for Pavley. See responses C187-8, -9, -10, -11 and -16.

C187-35: See responses C187-24 and -25.

C187-36: See responses C187- through -11, -16 and -19. In addition, see Master Response D.1 on regional greenhouse gas emissions reductions permitted under SB 375.

C187-37: The commenter claims the proposed Plan vastly underfunds maintenance of local streets and roads. The proposed Plan invests \$94 billion, or 33 percent, of the Plan’s revenues into the operations and maintenance of roads and bridges. While the local streets and roads needs still exceed funding allotted under the proposed Plan, MTC and ABAG believe this is a significant and reasonable investment in maintenance of local street and roads.

C187-38: This commenter summarizes many of the comments stated in more detail earlier in the letter. See responses C187-6 through 20, 23 through 29, and 32 through 37 above.

C187-39: Commenters states the comment letter and its attachments include “unassailable analysis.” MTC and ABAG have considered the comment letter and its attachments. As discussed further in responses C187-1 through C187-39, MTC and ABAG do not agree with many of the conclusions reached in the comment letter and its attachments. Such disagreement does not render the EIR inadequate. “The fact that different inferences or conclusions could be drawn, or that different methods of gathering and compiling statistics could have been employed, is not determinative... [Citation] The issue is not whether other methods might have been used, but whether the agency relied on evidence that a ‘reasonable mind might accept as sufficient to support the conclusion reached’ in the EIR.” [Citation]” (*North Coast Rivers Alliance v. Marin Municipal Water District Board of Directors* (2013) 216 Cal.App.4th 614, 642.) MTC and ABAG have complied with their obligations pursuant to CEQA.

C187-40: Pursuant to SB 375, the proposed Plan consists of both the regional transportation plan (RTP) and sustainable communities strategy (SCS) for the San Francisco Bay Area. Commenter’s opposition to the proposed Plan and opinion that the proposed Plan is not sustainable are noted. The decision-makers will determine whether the proposed Plan complies with SB 375 and related legal mandates in deciding whether to adopt the proposed Plan or one of the alternatives analyzed in the EIR. See also response C187-39.

Letter C188 Rebecca Lapedus (5/15/2013)

C188-1: The commenter challenges the statement that global climate change is an immediate threat. The climate change discussion and analysis included in the EIR was prepared by MTC and ABAG’s staff and consultants using scientifically-vetted and generally-accepted modeling techniques. Regardless of any differences of opinion on the causes and existence of climate change, Plan Bay Area is required to adhere to the GHG emissions reductions targets established by SB 375.

C188-2: The commenter criticizes the reliance of the Draft EIR analysis on the United Nations Intergovernmental Panel on Climate Change (IPCC). The IPCC is a well-respected

international body dedicated to climate change research. The IPCC is a legitimate source of climate change information. Regardless of any differences of opinion on the causes and existence of climate change, Plan Bay Area is required to adhere to the GHG emissions reductions targets established by SB 375.

The commenter also includes criticism of the Draft EIR for not including a cost/benefit analysis related to climate change. A cost/benefit analysis is not required by CEQA. However, in preparing the proposed Plan, individual transportation projects submitted for inclusion in the proposed Plan were evaluated using a benefit cost analysis¹³.

- C188-3: The commenter questions the Draft EIR's focus on CO₂. A primary objective of Plan Bay Area is to comply with SB 375, which mandates that MPOs develop Sustainable Communities Strategies that demonstrate attainment with GHG emissions reductions, as assigned to each region by CARB. As the comment itself notes, CO₂ is the greenhouse gas that the CARB targets are based upon per AB 32.
- C188-4: See responses C188-1 and C188-2. This comment, like the others, is questioning the science of climate change. The purpose to this EIR is to disclose potential environmental impacts of the proposed Plan in accordance with CEQA. The analysis is supported by both expert opinions supported by data and reasonable assumptions predicated on facts.
- C188-5: MTC and ABAG agree with the commenter that CO₂ is only one of many GHGs. For the purposes of the proposed Plan, however, one of the basic project objectives was to comply with SB 375 by achieving the per capita CO₂ emissions reduction targets for the San Francisco Bay Area. See responses C188-2 and C188-4.
- C188-6: The commenter questions the impact the SB 375 CO₂ emission reductions will have and how the proposed Plan can be justified by such an insignificant reduction. SB 375 is a state law, and CARB established the targets following a robust public process and evaluation of the targets. While the GHG reductions may constitute a small part of the overall CO₂ in the atmosphere, it is the amount that MTC and ABAG are required to attain per SB 375.
- C188-7: See responses C188-3, 4, and 6.
- C188-8: The public comment period adheres to CEQA requirements. Plan Bay Area is meant to satisfy the requirements of SB 375, which sets CO₂ emissions reduction targets for each region. The proposed Plan seeks to do so while balancing a large spectrum of considerations.
- C188-9: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.
- C188-10: Neither of the factors presented contradict the Plan Bay Area economic assumptions. In fact, both corroborate the data used to develop the economic forecast. The Bay Area's share of the national jobs in 1990 was 2.64 percent and fell to 2.50 percent by 1995, primarily due to cutbacks in military expenditures which were a significant part of the Bay Area economy.

¹³ http://onebayarea.org/pdf/Draft_Plan_Bay_Area/Performance_Report.pdf

The dot com boom pushed the Bay Area share to 2.67 percent in 2000, and the subsequent recession brought the share to 2.46 percent by 2004. The more recent recession has seen the Bay Area share fall to 2.37 percent in 2010. Since the late 1990s, changes in the Bay Area share of national jobs, both increases and decreases, were driven in large part by the high-tech industry sectors. It is expected that as the national economy recovers, the Bay Area share of the national jobs will increase at a more gradual rate up to about 2.5 percent.

C188-11: The number of employed residents is not a determinant of the number of households needed to house the Bay Area's population. Rather, the estimate of households is a factor of births, deaths, new families and individuals moving into the region, and historical rates of housing production. Several factors determine the changes in the employed residents per household, including changes in labor force participation rates and unemployment rates. The employed residents per household in 2010 in the Bay Area was 1.25, with an unemployment rate of 10.6 percent for the region. The forecast assumes that unemployment rates will decline to 5.1 percent by 2020. This reduction in the unemployment rate assumes that roughly 200,000 workers who were unemployed in 2010 will become re-employed by 2020, bringing the employed residents per household to 1.36. As the Bay Area population ages, labor force participation rate (the proportion of working residents) will decline and the employed residents per household is expected to decrease to 1.31. For more information on the forecast see:
http://onebayarea.org/pdf/Draft_Plan_Bay_Area/Draft_PBA_Forecast_of_Jobs_Population_and_Housing.pdf.

C188-12: Plan Bay Area constitutes the region's first Regional Transportation Plan (RTP) that includes a Sustainable Communities Strategy (SCS) as required by SB 375. An SCS is required of every regional transportation plan in California. The proposed Plan does not regulate land use; local jurisdictions retain all existing land use authority. See Master Response A.1 regarding local land use control.

Letter C189 John Charles (5/15/2013)

C189-1: The outcomes of light rail TOD planning in Portland, Oregon do not necessarily translate to the results in the Bay Area, a larger metropolitan area with a wide variety of transit operators and mode types, different demographics and commute patterns, and different state legislation. Background research conducted for Plan Bay Area and this EIR supports the conclusion that transit ridership can benefit from closer integration of land use and transportation planning. See Master Response D.2 for additional information on the connection between high density housing near transit and reduced greenhouse gas emissions, which helped inform the analysis of the environmental consequences of the proposed Plan. Furthermore, there are other motivations beyond travel mode split for MTC and ABAG to promote infill development and redevelopment, including better use of existing transportation infrastructure, enhancing walkability, and helping preserve open space and agricultural lands.

C189-2: PDAs are by definition already served by frequent transit service and very few PDA/TOD locations targeted by the proposed land use pattern are in greenfields. One of the main strategies of the proposed Plan is to limit greenfield development by emphasizing infill development based off of the region's existing transit network. In addition, major transit expansions such as new BART stations are accompanied with requirements for localities to adopt a specific land use plan that provides for a minimum amount of residential units and

office space within a walkable distance from the station, in order to ensure that new development around the station is at transit-oriented densities and design.

C189-3: Chapter 2.3, Land Use and Physical Development, includes an assessment of displacement and alterations to existing neighborhoods as well as the consistency of the planning concepts in the proposed Plan with local General Plans and other applicable land use plans. In Chapter 2.2, Air Quality, livability impacts related to local pollutants are examined, and in Chapter 2.10, Visual Resources, the aesthetic dimensions of livability are examined. Furthermore, the proposed Plan contains no details or requirements on citywide design and development guidelines; these are at the discretion of individual localities which are best positioned to determine local quality of life. MTC and ABAG have no local land use authority and any changes to zoning and/or design guidelines would be undertaken voluntarily by local jurisdictions; see Master Response A.1 on local control over land use for more details.

C189-4: The feasibility (or “financial sustainability”) of higher-density (or “Transit-Oriented”) development varies through the Bay Area and the analysis takes that into account. Commenter details the higher costs of building taller, higher-density structures in Portland. UrbanSim, the economic model used to analyze future land use patterns for the EIR, incorporates similar data on the higher costs of building taller in the Bay Area. However, the model also incorporates the other half of the real estate market: the demand for both residential and commercial space that exists in many of the locations recommended for additional density in the proposed Plan. The market is currently generating tall, profitable buildings in many of the locations the proposed Plan calls for intensification.

Commenter also correctly points out that regulation often drives the costs of density higher in central locations. Chapter 1.1 of the Draft EIR discusses the CEQA streamlining tools available in California that will be used to level the playing field and decrease the very real costs of regulation in high-density central locations. See Master Response A.2 regarding CEQA streamlining. The analysis assumes this will be modestly successful and this will render additional projects in the core profitable. Finally, the Proposed Plan is ambitious and it does call for increased density in some locations that do not currently have a strong enough real estate market to produce taller structures. For these locations, additional policies, perhaps including subsidies, will likely be necessary to prompt this growth. A program similar in scale to California’s previous redevelopment program would be sufficient to close the profitability gap in these locations. Overall, higher-density, transit supportive growth is already occurring in the Bay Area and the proposed Plan’s vision for continued higher-density urban development is financially sustainable. See Mater Response B.2 regarding the feasibility of the proposed Plan’s PDAs and Master Response H regarding UrbanSim’s analysis of subsidies.

Commenter goes on to discuss financial difficulties in providing transit service. Sound transit finances must be dealt with from both directions. While health care and other labor costs continue to put pressure on transit agency budgets, intensive land use concentrations (both housing and employment) near transit drives ridership and this in turn drives up the percentage of the agency budget that is recovered from riders.

C189-5: See Master Response D.2 for additional information on the connection between high density housing near transit and reduced greenhouse gas emissions, which helped inform the analysis of the environmental consequences of the proposed Plan. As demonstrated in Table 3.1-12

of the Draft EIR, the proposed Plan is projected to decrease VMT compared both to 2010 and 2040 No Project conditions.

C189-6: Telecommuting was included in the transportation modeling for the proposed Plan and each alternative. See response C151-20 for additional information on telecommuting.

Letter C190 Peter Gordon (5/16/2013)

C190-1: This comment, relates to whether there is a connection between “policy regimes” and actual settlement patterns, as documented by Brookings Institution studies. This EIR recognizes that zoning and other land use controls play a dominant role in land use patterns and housing affordability; see discussion of the regulatory setting in Chapter 2.2, Land Use and Physical Development. See also Master Response D.2 for additional information on the connection between high density housing near transit and reduced greenhouse gas emissions, which helped inform the analysis of the environmental consequences of the proposed Plan. See also Master Response F regarding displacement and the *Jobs Housing Connection Strategy*.

Letter C191 Herbert Brown (5/13/2013)

C191-1: Commenter’s opposition to the use of local funding sources to support projects and programs included in the proposed Plan is noted. Please see Master Response A.1 regarding local land use control.

C191-2: See responses C187-6 and C187-7.

Letter C192 Debbie Coffey (5/14/2013)

C192-1: Commenter’s support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

C192-2: MTC and ABAG respectfully disagree with commenter’s statement regarding the data used for the Draft EIR. Data was collected from a variety of sources, including, but not limited to, data derived from ABAG. The comment lacks specific details about which data the commenter believes are problematic, so a further response is not possible.

C192-3: The commenter is correct that the proposed Plan does provide benefits for implementing agencies and project sponsors. Also see Master Response H regarding UrbanSim and subsidies.

C192-4: “Project sponsor” is a term used in CEQA for an agency or organization that is proposing a project undergoing environmental review, and so largely refers to any land development that follows the proposed Plan—whether a public entity or private party—as well as the entity in charge of transportation projects (such as a city, county, or transportation authority).

C192-5: Geologic and seismic impacts of the proposed Plan and accompanying adequate mitigation measures are provided in Chapter 2.17, Geology, of the Draft EIR.

C192-6: This EIR is a public disclosure document on the potential environmental impacts of the proposed Plan; it contains no land use regulations. The mitigation measures specified in the

Draft EIR are at the discretion of individual implementing agencies to adopt. Please see Master Response A.1 regarding local control over land use.

- C192-7: This EIR analyzes the potential significant impacts of the adoption and implementation of the proposed Plan Bay Area (proposed Plan), which is the update to the 2009 Regional Transportation Plan (RTP) and the new Sustainable Communities Strategy (SCS) for the San Francisco Bay Area. As required by State legislation (Government Code Section 65080 et seq.) and by federal regulation (Title 23 USC Section 134), MTC is responsible for preparing the RTP for the San Francisco Bay Area Region. MTC and ABAG are required to prepare an RTP including an SCS pursuant to SB 375.
- C192-8: The MTC and ABAG Board consist of elected representatives from many counties and cities of the region and their decisions reflect the decisions of these voter-selected officials. PDAs have been adopted voluntarily by local jurisdictions by city councils or boards of supervisors. As the ultimate decision-makers in their communities regarding land use, they determine what is appropriate. Any public notification process, or a public ballot, regarding the definition and adoption of a PDA is up to each individual jurisdiction. Just as local jurisdictions nominated PDAs within their jurisdiction, the local implementing agencies have discretion over implementing the PDAs. See Master Response A.1 regarding local land use control and Master Response I regarding the PDA process.
- C192-9: See response C192-8.
- C192-10: The proposed Plan is a regional plan. The proposed Plan does not alter the local land use control of local jurisdictions and local jurisdictions have the discretion to implement the proposed Plan in consideration of local issues. See Master Response A.1 regarding local land use control.
- C192-11: As specified in the Draft EIR, Integrated Pest Management Techniques involve “methods that minimize the use of potentially hazardous chemicals for landscape pest control and vineyard operations” (ES-40).¹⁴ In addition, according to the U.S. Environmental Protection Agency, these techniques are designed to “manage pest damage by the most economical means, and with the least possible hazard to people, property, and the environment.”¹⁵
- C192-12: The proposed Plan is required under federal and State regulations to plan for and accommodate future conditions through 2040. Forecasts included in the proposed Plan and EIR are based on the expert opinions and analysis of MTC and ABAG staff and consultants, and utilize sophisticated modeling techniques were available and appropriate. Forecasts by their very nature rely on assumptions about the future. These assumptions have been vetted by MTC and ABAG’s expert staff and consultants. All forecasts are based on factual data and MTC and ABAG believe all forecasts included in the EIR are reasonable.
- C192-13: The proposed Plan is designed to limit future development to existing urban boundary lines in order to preserve farmland. As shown in the Draft EIR, Chapter 1.2, Table 1.2-2, MTC and ABAG adopted a project objective to direct all non-agricultural development within the

¹⁴ Draft EIR, ES-40.

¹⁵ U.S. Environmental Protection Agency, “Integrated Pest Management Principles.” U.S. EPA website, last updated May 9 2012, accessed June 10, 2013, <http://www.epa.gov/pesticides/factsheets/ipm.htm>.

Year 2010 urban footprint (existing urban development and urban boundary lines). Chapter 2.3 also analyzes the proposed Plan's impacts on agricultural land conversion.

- C192-14: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C193 Bruce London (5/16/2013)

- C193-1: Commenter is correct that the Draft EIR includes the quoted statement..
- C193-2: Commenter is correct that the Draft EIR includes the quoted statement.
- C193-3: Commenter is correct that the Draft EIR includes the quoted statement.
- C193-4: Commenter is correct that the Draft EIR includes the quoted statement.
- C193-5: Commenter is correct that the Draft EIR includes the quoted statement.
- C193-6: As the proposed Plan is a regional level plan, it is outside the scope of the Draft EIR to evaluate impacts for each individual jurisdiction within the Bay Area region. See Master Response A.3 on specificity of a program EIR. For a detailed regional-scale analysis of the potential visual impacts of the proposed Plan as well as associated mitigation measures, please refer to the Draft EIR Chapter 2.10, Visual Resources.
- C193-7: . MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.
- C193-8: See response C193-7.
- C193-9: The MTC and ABAG Board consist of elected representatives from many counties and cities of the region and their decisions reflect the decisions of these voter-selected officials.
- C193-10: Commenter is correct that the Draft EIR includes the quoted statement.
- C193-11: This EIR is on Plan Bay Area, not the RHNA, which is a separate program. The RHNA must be consistent with Plan Bay Area but covers a shorter period of time (8 years instead of 28) and addresses other goals beyond those of Plan Bay Area.
- C193-12: Typically public services are the responsibility of local jurisdictions and are funded through sales and property tax revenues and impact fees. Development under the proposed Plan will be subject to all local regulations and fees. Implementing agencies will consider issues such as those identified by the commenter in exercising their discretionary authority to approve or deny future second-tier projects contemplated by the proposed Plan. See Master Response A.1 regarding local land use control.
- C193-13: See response C193-12.

C193-14: See response C193-12.

C193-15: See response C193-12.

C193-16: This EIR evaluates Plan Bay Area as a single, regional project and assesses its impacts at a regional level across all nine counties, which is consistent with CEQA provisions regarding program EIRs. See Master Response A.3 regarding the level of specificity of the EIR. In considering approval of the individual projects that may result from the Plan - transportation improvements and land use development - the implementing agencies must comply with CEQA. A county-level evaluation of the proposed Plan and its impacts would be at a greater level of detail than required. Impacts have been assessed at a regional level and a conceptual localized level. County level information has been provided in the EIR when feasible. The Draft EIR Chapter 2.14, Public Services, evaluates the proposed Plan's potential impact on fire services and presented adequate mitigation measures to combat these impacts.

C193-17: See response C193-16.

C193-18: See response C193-9.

Letter C194 Piers Whitehead (5/14/2013)

C194-1: Please see Master Response C regarding requests for extensions of the public comment period.

Letter C195 Allen Appell (5/12/2013)

Commenter's opposition to the proposed Plan is noted. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt. .

Letter C196 Louisa Arndt (5/16/2013)

Commenter's opposition to the proposed Plan is noted. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C197 Brenda Barron (5/16/2013)

As shown in Table 1.2-10 of the Draft EIR (see updated version in Section 2 of this Final EIR), the proposed Plan would increase funding for transit operations and maintenance by 43 percent (\$48 billion) compared to the current RTP, and increase the proportion of funding going to transit operations and maintenance from 51 to 55 percent of available funds. AS explained on p. 1.2-50, the proposed Plan will allocate \$15 billion of its discretionary funds in particular to maintain and sustain the existing transit system. These strategies should help the region's transit agencies provide more frequent bus service. Chapter 2.3 analyzed transit crowding and found a less than significant impact due to implementation of the proposed Plan.

Letter C198 Bert Bartsch (5/16/2013)

See the responses to Letter C205.

Letter C199 James Bitter (5/16/2013)

The proposed Plan will only be implemented insofar as local jurisdictions adopt its policies and recommendations. Please refer to Master Response A.1 on local control over land use.

Letter C200 Linda Christopoulos (4/26/2013)

Commenter's opposition to development in southern Marin is noted. Priority Development Areas (PDAs) were nominated by local governments. In addition, local jurisdictions have local land use authority, and will be responsible for individual permitting decisions within their jurisdiction. The proposed Plan does not compel any local jurisdiction to revise their existing zoning code. The proposed Plan will only be implemented insofar as local jurisdictions adopt its policies and recommendations. Please refer to Master Response A.1 on local control over land use.

Letter C201 Steve Raney (5/13/2013)

No comments in this letter raise environmental issues under CEQA. Your suggestions will be taken into account by MTC and ABAG as they implement Plan Bay Area.

Letter C202 Daniel DeBusschere (5/16/2013)

The proposed Plan does not address bike lockers at BART stations. These are issues to be determined by individual transit operators, such as BART. MTC and ABAG agree with the commenter's statement that parking and biking are important to reducing VMT. The proposed Plan supports alternative transportation, and included a performance target for active transportation as well as VMT. See the Supplemental Report *Performance Assessment Report* for more details regarding those performance targets.

Letter C203 Adam Garcia (5/16/2013)

Your requests for the Plan to include strategies to assist jurisdictions in bicycle lane development, a regional bike master plan, maps of primary regional bicycle routes in the proposed Plan, a Casual Carpool program that links to HOT lanes, and a Highway BRT study all regard the proposed Plan and do not raise environmental issues under CEQA. As noted in Response B30-1.5, this EIR includes a reasonable range of alternatives that would lessen environmental effects, as required by CEQA. The EIR does not need to address every conceivable alternative. MTC and ABAG appreciate receiving the selected recommendations. The requested additional programs are not being included in the Draft Plan at this time, but may be considered for future updates of the RTP/SCS or may become part of implementation of Plan Bay Area.

Letter C204 Doreen Gleason (5/15/2013)

C204-1: Please see Master Response A.1 for more information regarding local control over land use.

Letter C205 Valeri Hood (5/16/2013)

C205-1: The proposed Plan does not mandate growth but instead accommodates growth forecasted in the San Francisco Bay Area. See chapters 2.1 (Transportation), 2.12 (Public Utilities and

Facilities), and 2.14 (Public Services and Recreation) for further discussion of road, sewer, school, and water supply impacts. Please see Master Response A.1 for more information regarding local control over land use.

- C205-1.5: As explained in Chapter 2.13 of the Draft EIR, these are sites that could contain toxic materials, which frequently occur in urban infill sites. This is a conservative analysis and the actual number of development sites with toxic hazards would likely be much lower. As Chapter 2.13 notes, there many existing federal, State, and local laws and regulations that will mitigate impacts from such issues to a less than significant level. The proposed Plan does not allocate any housing income levels and so the commenter's claim that toxic sites would be populated by marginalized communities is spurious.
- C205-2: The decision to use desalination as a water source to serve its customers would be solely the decision of MMWD and is not advocated for or required by the proposed Plan. The current MMWD Urban Water Management Plan indicates adequate water supplies through the year 2035 without a need to resort to desalination. The proposed Plan would result in essentially the same year 2040 population as under the No Project alternative - a three percent increase, with the proposed Plan resulting in 500 more households in Marin County than under the No Project scenario. Given the water supplies indicated by MMWD, it is extremely unlikely that additional water supplies will need to be acquired due to growth under the proposed Plan. Moreover, in August of 2010, the District adopted Ordinance 420, which states that the District shall not approve construction, or financing for construction, of a desalination facility unless such construction is approved by a majority of District voters, voting in an election held within the District's service area for that purpose.
- C205-3: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.
- C205-4: The MTC and ABAG Board consist of elected representatives from many counties and cities of the region and their decisions reflect the decisions of these voter-selected officials.

Letter C206 Jane Hook (5/11/2013)

The Marinwood Area is within a Priority Development Area—the Urbanized 101 Corridor. This PDA was nominated by the Marin Board of Supervisors, who adopted a resolution authorizing submission of an application on August 7, 2007. It was adopted by the ABAG Executive Board and is therefore included in the proposed Plan. Any change to the PDA would need to come at the request of the Marin County Board of Supervisors. See Master Response I regarding the PDA process. See also Master Response A.1 regarding local land use control.

Letter C207 Judy Karau (5/12/2013)

Commenter's opposition to the proposed Plan as it relates to Tam Valley is noted. The proposed Plan serves as the region's first integrated long-range land use and transportation plan. It is statutorily mandated to cover the nine-county and 101-city San Francisco Bay Area.

Letter C208 Adina Levin (5/10/2013)

See responses B24-2 through B24-7.

Letter C209 Elizabeth Manning (5/16/2013)

C209-1: Commenter's opposition to the proposed Plan is noted. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt. The MTC and ABAG Board consist of elected representatives from many counties and cities of the region and their decisions reflect the decisions of these voter-selected officials.

Letter C210 Kim Mollenauer (4/29/2013)

Priority Development Areas (PDAs) were nominated by local governments. See Master Response I regarding the PDA process. In addition, local jurisdictions have local land use authority, and will be responsible for individual permitting decisions within their jurisdiction. The proposed Plan does not compel any local jurisdiction to revise their existing zoning code. The proposed Plan will only be implemented insofar as local jurisdictions adopt its policies and recommendations. Please refer to Master Response A.1 on local control over land use.

Letter C211 Kim Mollenauer (4/29/2013)

Commenter's property tax concerns are noted. Commenter does not raise environmental issues that require a response under CEQA.

Letter C212 Dan Ransenberg (4/29/2013)

C212-1: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

See the responses to the letter from the City of Sausalito, A16; the City did not challenge the projected jobs and housing in the Draft Plan.

Letter C213 Hank Rose (4/27/2013)

Commenter's opposition to the proposed Plan is noted. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C214 Richard Hall (5/3/2013)

C214-1: Please see Master Response C regarding requests for extensions of the public comment period.

C214-1.5: See Chapter 3.1 of the EIR, which includes extensive quantitative and qualitative analysis and comparisons between the alternatives analyzed in the EIR.

- C214-2: The *Draft Summary of Predicted Traveler Responses* provides a brief overview of the MTC travel model which takes traveler preferences into account. Detailed documentation of the MTC travel model is available in the *Travel Model Development: Calibration and Validation Technical Report*¹⁶. The model's estimates of VMT rely on behavioral models applied to individual travelers, not historical trends. Forecasted changes in mode share as a result of the Plan can be found in Table 2.1-13 of the Draft EIR on page 2.1-29, demonstrating that transit and walk mode share are expected to grow while drive alone mode share is expected to decline over the life of the Plan.
- C214-3: The comment raises no environmental issue to which a response is required under CEQA. For more information on the project performance analysis done to evaluate projects, see the Supplemental Report *Performance Assessment Report*.¹⁷ In addition, see Chapter 5, Performance, of the Draft Plan regarding the performance framework used to develop the proposed Plan.
- C214-4: The proposed Plan in fact devotes a significant portion of its budget to operating and maintaining the existing roadway system. The Draft EIR, on p. 1.2-49, notes that the proposed Plan allocates over 79 percent of its budget to committed projects, which include many highway and roadway projects, and the remaining discretionary funds are allocated mainly to "fix it first" projects with 87 percent of total funds going to operations and maintenance (see updated Table 1.2-10 in Section 2 of this Final EIR). "Compared to Transportation 2035, the proposed Plan Bay Area would spend a higher percentage of its budget on transit and roadway operations and maintenance, less on expansion of transit network, and roughly the same percent on road and bridge expansion." In addition, as Table 1.2-10 of the Draft EIR shows, the proposed Plan will increase road and bridge operations and maintenance from 30 percent of the overall Transportation 2035 budget to 32 percent of the Plan Bay Area budget, an increase of \$28 billion (see updated numbers in Section 2.2 of this Final EIR); these funds are available due to a decrease in the proportion and amount of money to be spent on transit system expansion compared to the last RTP. In light of this transportation investment strategy, the proposed Plan clearly supports a continuation of personal automobile use. MTC must fund a transportation system that serves a growing population and many lifestyles while achieving targets assigned by the State, and this requires supporting transit as well as roadway systems.
- As shown in Table 3.1-28 of the Draft EIR, the No Project alternative fails to attain the SB 375 target under the rules set by SB 375; see Master Response D.1 regarding which calculations are allowed. The table cited in the comment, Table 3.1-29, shows transportation emissions assuming technologies and policies not permitted to assess SB 375 compliance.
- C214-5: See response C214-3 and review the analysis of Impacts 2.5-1 and 2.5-2 in Chapter 2.5 of the Draft EIR. The former assesses per capita emissions following the requirements of SB 375, as described in Master Response D.1; the latter assesses net GHG emissions from all land use and transportation sources.
- C214-6: CARB's requirement is for Plan Bay Area to reduce per capita GHG emissions from cars and light trucks, without considering fuel standards and technological improvements; see the analysis under Impact 2.5-1 of the Draft EIR and Master Response D.1 regarding assumptions allowed in meeting SB 375 targets. Transit emissions are accounted for in the

¹⁶ http://mtcgis.mtc.ca.gov/foswiki/pub/Main/Documents/2012_05_18_RELEASE_DRAFT_Calibration_and_Validation.pdf

¹⁷ <http://onebayarea.org/regional-initiatives/plan-bay-area/draft-plan-bay-area/supplementary-reports.html>

analysis of Impact 2.5-2; see Table 2.5-9 and the comparative analysis of transit emissions in Table 3.1-29 under buses and other vehicles.

- C214-7: The EIR considered three alternatives to the proposed Plan, plus the No Project alternative. The EIR only need consider a reasonable range of alternatives to the proposed Plan, not all potential alternatives. See Chapter 3.1 of the Draft EIR for a description of the alternatives screening process.
- C214-8: See the Mitigation Monitoring Program which will accompany certification of the EIR. Additionally, as the RTP and SCS for the San Francisco Bay Area, the proposed Plan will be updated every four years.
- C214-9: The lack of detail in this comment makes it impossible for MTC and ABAG to respond. MTC and ABAG believe this EIR provides an adequate assessment of the proposed Plan's environmental impacts as required under CEQA.
- C214-10: See response C214-9.
- C214-11: The comment does not raise a direct point or question about the proposed Plan or EIR, but seems to imply that Plan Bay Area should include targets regarding CO₂ emissions from transit. Transit emissions are accounted for in the analysis of Impact 2.5-2; see Table 2.5-9 and the comparative analysis of transit emissions can be found in Table 3.1-29 under buses and other vehicles.
- C214-12: The proposed Plan was prepared in a manner consistent with the requirements of SB 375 and other applicable laws. MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.
- C214-13: See responses C214-4 and 5.
- C214-14: MTC and ABAG respectfully disagree with the commenter that increasing non-auto mode share by 10 percent and decreasing VMT per capita are not valid goals. This is a voluntary target adopted by MTC and ABAG, which are permitted to adopt goals with wide latitude. This goal was also adopted by MTC for the current Regional Transportation Plan, Transportation 2035, "Reduce daily per-capita vehicle miles traveled (VMT) by 10 percent from today by 2035." The analysis under Impact 2.5-2 in the Draft EIR shows that total net GHG emissions will decrease under the proposed Plan; see responses C214-4 and 5 as well, which discuss this impact analysis as well as the increase in funding for roadways in the proposed Plan compared to Transportation 2035. The commenter fails to explain what is "disproportionately high" about the transit investments in the proposed Plan; the No Project alternative would in fact devote a higher proportionate of funds to transit—especially transit system expansion—than the proposed Plan.

MTC's travel model does account for GHG emissions and other air quality impacts from roadway congestion. The commenter should note much of the roadway congestion impacts by 2040 would occur as a result of inevitable population growth (see Master Response B.1)

and that the proposed Plan would result in significantly less congestion than would occur under the No Project alternation, as explained on p. 3.1-20 of the Draft EIR: “As a result, the No Project alternative leads to per-capita congested VMT levels that are 150 percent higher than the proposed project during the AM peak, 97 percent higher during the PM peak, and 115 percent higher over the course of a typical weekday.” Also see Table 3.1-11.

See response C214-4 again regarding the proposed Plan’s continued support for private automobile usage.

The regional travel demand model (Travel Model One) captures transit delays as a result of traffic congestion. For transit vehicles operating in mixed flow, the transit passengers’ travel time reflects vehicle speeds on the roadway, combined with a land use factor that incorporates expected delay from bus stops (caused by passenger boardings & alightings). These transit delay impacts are incorporated into overall transit travel times, as shown in Tables 2.1-14 and 2.1-15. These tables show that average transit per trip commute travel time would increase from 44 to 44.3 minutes (1%) and non-commute travel time would decrease from 36.2 to 35.5 minutes (-2%). On balance, transit travel time essentially stays the same. This comment does not explain how reducing “commute radiuses” [sic] creates adverse environmental impacts.

- C214-15: The objectives listed by the commenter are targets MTC and ABAG determined the proposed Plan should strive to achieve. The proposed Plan includes strategies designed to help achieve these targets.
- C214-16: GHG emissions from transit, as included in the analysis of Impact 2.5-2 of the Draft EIR, are based on 2010 emissions. The data shown are aggregate net emissions; ridership levels do not factor into this calculation.
- C214-17: Analyzing per capita transit emissions would be immaterial to determining whether the proposed Plan exceeds the criteria of significance related to SB 375 adopted by MTC and ABAG. Criterion 2.5-1 evaluates per capita GHG emissions from cars and light trucks, as required by SB 375, and Criterion 2 evaluates net GHG emissions from all land use and transportation sources, including transit. The analysis requested would not change the conclusions of the EIR.
- C214-18: Chapter 2.1 of the Draft EIR discusses existing travel modes and shows travel by mode in Tables 2.1-6 and 2.1-7. The proposed Plan seeks to make transit a more realistic travel alternative through transportation programs and investments, as well as more transit-oriented development. MTC and ABAG expect that many trips in the region will continue to be by car; see Table 2.1-13, as well as response C214-4 again regarding the proposed Plan’s continued support for private automobile usage.
- C214-19: See response C214-18.
- C214-20: This issue is evaluated under Impacts 2.1-1 (per-trip travel time for commute travel) and 2.1-2 (non-commute travel) in Chapter 2.1 of the Draft EIR. The EIR found a less than significant impact at a regional level in both instances.
- C214-21: See response C214-20, the analyses discussed evaluates all travel modes, per the criteria of significance.

- C214-22: See response C214-4 and C214-18 regarding roadway investments and travel mode expectations. The proposed Plan would reduce the average distance between residences and workplaces, as shown in Table 2.1-16 of the Draft EIR, which would help make travel by non-auto modes more feasible.
- C214-23: See response C214-22. The comment does not explain how reduced commute radii would have an adverse environmental impact. Economic impacts are beyond the scope of CEQA.
- C214-24: See response C214-20; the analyses discussed evaluate all travel modes, per the criteria of significance.
- C214-25: This issue is evaluated under Impact 2.1-3 in Chapter 2.1 of the Draft EIR. The EIR found a significant and unavoidable impact and proposes Mitigation Measures 2.1(a), (b), and (c) to reduce the impacts.
- C214-26: The proposed Plan is designed to achieve a number of objectives. MTC and ABAG have the discretion to adopt reasonable objectives for the proposed Plan. Increasing walking and biking time is a valid objective for a number of reasons including the health benefits of these activities..
- C214-27: It is not within the scope of this EIR or the proposed Plan to question the validity of SB 375. Instead, as required by law, one of the proposed Plan's basic objectives is to achieve the CO₂ emission targets established for the region pursuant to SB 375.
- C214-28: See Impact 2.5-2 of the Draft EIR which evaluates whether the proposed Plan reduces net GHG emissions from transportation and land uses; it finds that it would do so.
- C214-29: It is not within the scope of this EIR or the proposed Plan to question the validity of SB 375.
- C214-30: MTC and ABAG are unable to identify where in the Draft Plan or Draft EIR there is a reference to a "multi-modal transit" goal. The only occurrences of the term multimodal are found in references to the "the multimodal investment strategy" of the existing regional transportation plan, Transportation 2035 and that, "A well-maintained multimodal transportation system is fundamental to the success of the more compact future land use ..." on page 67 of the Draft Plan. Pages 2.1-28 and 29 of the Draft EIR discuss future mode share expected as result of the proposed Plan, and finds modest shifts to transit and walking and away from driving alone and carpooling. This analysis was conducted by the MTC travel model; see the *MTC Travel Demand Forecasts, 2012*.
- C214-31: The comment claims that MTC and ABAG ignore the impact of traffic congestion on GHG emissions. This is not accurate. As demonstrated in Figures 24 and 26 (pp. 59 and 61) in the *Draft Summary of Predicted Traveler Responses* supplementary report, MTC and ABAG expect congestion to increase between today and 2040. These congestion estimates are fed into the CARB emissions estimation software (EMFAC2011). As such, MTC and ABAG explicitly consider the increase in congestion on the Draft EIR's GHG estimates.
- C214-32: See responses C214-2, C214-4, C214-18, and C214-30 regarding MTC and ABAG's recognition of existing levels of driving, investment in the regional roadway system, the

proposed Plan's objective of making non-auto modes more feasible options, and expectations of mode shift.

- C214-33: Air quality impacts within development areas and disproportionate impacts on communities of concern are evaluated in Chapter 2.2 of the Draft EIR.
- C214-34: See response C214-33.
- C214-35: See response C214-33.
- C214-36: See Master Response D.2 on GHG emissions reductions and transit-oriented development.
- C214-37: See Master Response H on UrbanSim and subsidies.
- C214-38: Typically public services are the responsibility of local jurisdictions and are funded through sales and property tax revenues and impact fees. Development under the proposed Plan will be subject to all local regulations and fees. See Master Response A.1 regarding local land use control. See also chapters 2.12 (Public Utilities and Facilities) and 2.14 (Public Services and Recreation) regarding impacts relating to public facilities and services.
- C214-39: For point "a" see Master Response D.2 for a discussion on how transit-oriented development reduces GHG emissions and the analysis under Impact 2.5-5 of the Draft EIR regarding transit capacity which found a less than significant impact. For point "b" see Master Response H on the UrbanSim and assumed subsidies. For point "c", per CEQA Guidelines impacts must be compared between existing conditions (2010) and the horizon year for the proposed Plan (2040); the exception is the analysis of per capita emissions from cars and light trucks required by SB 375 to use 2005 for existing conditions compared to 2020 and 2035. Based on responses C214-1 through C214-39, MTC and ABAG believe this EIR provides an adequate assessment of the proposed Plan's environmental impacts as required under CEQA.
- C214-40: MTC and ABAG believe this EIR provides an adequate assessment of the proposed Plan's environmental impacts as required under CEQA.
- C214-41: See Chapter 3.1 of the Draft EIR for a description of the alternatives screening process.
- C214-42: Yes, the alternatives were modeled for GHG emissions in the same manner as the proposed Plan and, therefore, incorporate transit related CO₂ emissions into the analyses. See pages 3.1-57 through 64 of the Draft EIR.
- C214-43: The EMFAC2011 model used by MTC and ABAG to calculate GHG emissions includes considerations such as length of trip as well as number of vehicle starts. For more information on EMFAC2011, see *EMFAC2011 Technical Documentation, Updated January 2013*, page 16.¹⁸
- C214-44: MTC and ABAG believe this EIR provides an adequate assessment of the proposed Plan's environmental impacts as required under CEQA; see responses C214-1 through C214-43 for specific concerns.

Letter C215 Various Bay Area Residents (6/14/2013)

- C215-1: Commenter's support for Alternative 5 is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.
- C215-2: The letter refers to a system of HOT lanes, which presumably is the Regional Express Lane Network. This Network represents only a modest increase in the region's freeway capacity. Table 3.1-7 of the Draft EIR shows only a 4 percent difference in freeway lane-miles between the No Project alternative, which includes only committed express lanes, and the proposed Project, which includes the full Network. This is because approximately half of the Network is composed of existing HOV lanes that will be converted to express lanes. Only the remaining half of the Network would be developed by building new express lanes. Furthermore, express lane mileage is managed capacity, which gives priority to transit and buses and is subject to Federal requirements to maintain speeds of 45 miles per hour or better 90 percent of the time express lanes are in operation. This effectively limits the number of vehicles to approximately 1,600 vehicles per hour per lane, which is less than the typical capacity of an unmanaged lane (2,200 vehicles per hour per lane).
- C215-3: See Master Response F regarding displacement. Commenter's suggestions regarding transit, affordable housing and displacement will be considered by decision-makers as part of the EIR certification process and action on the proposed Plan.
- C215-4: See response C215-3.

Letter C216 Thomas Ayres (5/8/2013)

- C216-1: Please see responses to Letter C215.

Letter C217 Anonymous (5/16/2013)

- C217-1: Commenter's opposition to the proposed Plan is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.
- C217-2: No comments from the specified groups in the comment were received (although letters may have been received by individuals belonging to these groups). The environmental analysis included in the EIR complies with the CEQA requirements applicable to a programmatic planning document. See Master Response A.3 regarding the programmatic nature of this EIR.
- C217-3: The proposed Plan does not take away local land use authority. Please see Master Response A.1 regarding local control over land use.
- C217-4: Please see Master Response C regarding requests for extensions of the public comment period.
- C217-5: The proposed Plan does not take away local land use authority. Please see Master Response A.1 regarding local control over land use.

- C217-6: The MTC and ABAG Board consist of elected representatives from many counties and cities of the region and their decisions reflect the decisions of these voter-selected officials. This Final EIR contains the comments by many agencies and people on the Draft EIR and the responses by MTC and ABAG. The proposed Plan was prepared in a manner consistent with the requirements of SB 375 and other applicable laws. MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.
- C217-7: Responseer's specified comments and questions are provided below.
- C217-8: See response C217-6.
- C217-9: See Chapter 2.3 regarding a discussion of projected housing preferences. Note that implementation of the proposed Plan is at the discretion of local jurisdictions; MTC and ABAG cannot "require" anything regarding land development. See Master Response A.1 for more information on local land use control. See also Master Response B.2 regarding the feasibility of the proposed Plan's PDAs.
- C217-10: Commenter's concern regarding the cost of implementing the proposed Plan is noted. Implementation of the proposed Plan is at the discretion of local jurisdictions; MTC and ABAG cannot "require" anything regarding land development. See Master Response A.1 for more information on local land use control. See also Master Response H for additional discussion of subsidies.
- C217-11: See response C217-6. Plan Bay Area is a regional project and is analyzed under CEQA at such a level. See Master Response A.3 regarding the programmatic nature of this EIR. MTC and ABAG have no local land use authority and cannot compel a jurisdiction to adopt or implement Plan Bay Area; see Master Response A.1 for information on local land use control. When changing land use plans and regulations in order to implement Plan Bay Area, local jurisdictions will need to comply with CEQA and must, where applicable, undertake their own environmental impact analysis.
- C217-12: CEQA is designed to provide substantial opportunities for input from responsible agencies, trustee agencies, other interested agencies and organizations, as well as the public. CEQA, therefore, by its own terms provides an opportunity for third party review and comments. It should also be noted that in preparing this EIR, MTC and ABAG worked with a number of other agencies, such as the Bay Conservation and Development Commission, the Bay Area Air Quality Management District, and the California Air Resources Board, and expert consultants to ensure the validity of the analysis included herein.
- C217-13: Typically public services are the responsibility of local jurisdictions and are funded through sales and property tax revenues and impact fees. Development under the proposed Plan will be subject to all local regulations and fees. See Master Response A.1 regarding local land use control. See also chapters 2.12 (Public Utilities and Facilities) and 2.14 (Public Services and Recreation) regarding impacts relating to public facilities and services.

- C217-14: These comments regard localized and specific impacts of land development design on crime prevention. This is a project-level issue and should be evaluated in project-level environmental review and/or local discretionary review; see Master Response A.3 regarding analysis required in a program EIR. All development under the proposed Plan is subject to local permitting, design guidelines, impact fees for public safety, and other land use controls; see Master Response A.1 regarding local land use control. Economics impacts are not environmental issues under CEQA.
- C217-15: Such a request is beyond the scope of this regional-scale, program EIR. See Master Response A.3 for more information on specificity of program EIRs. Further information on the programmatic nature of this environmental document can be found on page 1.1-4; additional information regarding the Draft EIR's emphasis on regional impacts can be found on page 2.0-1.
- C217-16: Per Chapters 2.5 and 2.7, site specific analysis will be required to identify issues with sea level rise and seismic concerns where applicable. The proposed Plan does not limit the existing land use authority of local implementing agencies; implementing agencies retain the discretion to modify or deny discretionary projects based on considerations such as sea level rise and seismicity. Also see response C217-15.
- C217-17: Questions posed at Draft Plan and Draft EIR hearings are answered in this Final EIR; see subsections D, E, and F of Section 3. MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

Letter C218 Elizabeth Appell (5/14/2013)

- C218-1: Please see Master Response B.1 regarding population projection as well as Master Response D.2 regarding the connection between high density near transit and reduced greenhouse gas emissions.
- C218-2: Pursuant to SB 375, an SCS must identify "areas within the region sufficient to house all the population of the region, including all economic segments of the population..." (Gov. Code § 65080(b)(2)(B)(ii).) The proposed Plan does so by producing a land use pattern that will accommodate HCD's Regional Housing Needs Determination (RHND) and through ABAG's and MTC's efforts to support additional affordable housing production. This includes Chapter 6 of the Plan, which identifies strategies for facilitating greater affordable housing preservation and production in the region. Many of these efforts require policy changes at the state or federal level that are beyond the control of the regional agencies, who will act as advocates for these changes. The regional agencies are providing more direct support for affordable housing through the Transit Oriented Affordable Housing (TOAH) fund, which supports affordable projects in Priority Development Areas and the identification of Affordable Housing as an allowable use for future Cap and Trade funds.
- C218-3: Please see Master Responses E and G regarding sea level rise and water supply, respectively. See also chapters 2.5 (Climate Change and Greenhouse Gases) and 2.12 (Public Utilities and Facilities).

C218-4: MTC and ABAG may find that the proposed Plan would create significant environmental impacts, but that these impacts would be outweighed by other benefits. In addition many of the significant and unavoidable impacts occur because MTC and ABAG cannot require local implementing agencies to adopt the mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. Please see Master Response A.1 on local control over land use for additional information.

C218-5: Commenter's opposition to the proposed Plan is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C219 Ashley Eagle-Gibbs (5/13/2013)

C219-1: Please refer to the analysis of Impact 2.1-5 in the Draft EIR, Chapter 2.1, Transportation, which found no significant impact on regional transit crowding under the proposed Plan. In addition, commenter's suggestion regarding Alternative 5 will be considered by decision-makers as part of the EIR certification process and action on the proposed Plan.

C219-2: Please see Master Response F regarding displacement. See also response C157-1.

Letter C220 Eric Ireland (5/13/2013)

Please refer to responses to Letter C219.

Letter C221 Marshall Sanders (5/1/2013)

Please refer to responses to Letter C215.

Letter C222 Shannon Tracey (5/16/2013)

Please refer to responses to Letter C215.

Letter C223 Elizabeth Wampler (5/9/2013)

Please refer to responses to Letter C215.

Letter C224 Betty Winholtz (5/13/2013)

C224-1: Your support for the transit funding component of Alternative 5 is noted.

C224-2: See Master Response F regarding displacement.

Letter C225 Kim Bowman (5/16/2013)

C225-1: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C226 Joyce Britt (4/25/2013)

C226-1: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt. In addition, please note that the No Project alternative does not imply that no growth will take place, as growth will happen regardless of implementation of the proposed Plan. See Master Response B.1 for more information on population projections.

Letter C227 Jon Campo (5/5/2013)

C227-1: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C228 June and Steve Kim (5/9/2013)

C228-1: The decisions referred to in this comment regarding the 101 Corridor Priority Development Area are at the discretion of Marin County, not MTC and ABAG. See Master Response I regarding the PDA designation process.

C228-2: Please see Master Response C regarding requests for extensions of the public comment period.

C228-3: Please see Master Response B.1 regarding population projections. It should also be noted that implementation of the proposed Plan requires discretionary actions by local jurisdictions with applicable land use authority; the proposed Plan does not compel local jurisdictions to approve any specific land use developments. See Master Response A.1 regarding local land use control.

C228-4: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C229 Mark Schoenbaum (5/16/2013)

C229-1: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C230 Sebastian Ziegler (4/8/2013)

C230-1: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

C230-2: MTC and ABAG are required to fulfill the terms of SB 375 with Plan Bay Area, but used an extensive multi-year planning process to recommend a high-level yet nuanced growth pattern. Local jurisdictions retain all land use control, however, per Master Response A.1

C230-3: See Master Response B.1 regarding the projections.

Letter C231 Victor Goodrum (4/2/2013)

- C231-1: Please see Master Response C regarding requests for extensions of the public comment period.
- C231-2: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

Letter C232 Barbara Hagen (4/22/2013)

- C232-1: Please see Master Response C regarding requests for extensions of the public comment period.
- C232-2: Implementation of the proposed Plan is at the discretion of local jurisdictions; MTC and ABAG cannot “require” anything regarding land development. See Master Response A.1 for more information on local land use control. As noted in Chapter 2.3 of the Draft EIR, almost half of the region’s population already lives in multi-family or townhouse units, and per the population projections (see Master Response B.1 and the *Jobs-Housing Connection Strategy*) that preference is expected to grow in the Bay Area.
- C232-3: General concerns regarding property values are an economic issue not a physical impact on the environment that must be addressed in an EIR pursuant to CEQA. .
- C232-4: Typically public services are the responsibility of local jurisdictions and are funded through sales and property tax revenues and impact fees. Development under the proposed Plan will be subject to all local regulations and fees. See Master Response A.1 regarding local land use control. See also chapters 2.12 (Public Utilities and Facilities) and 2.14 (Public Services and Recreation) regarding impacts relating to public facilities and services.
- C232-5: The MTC and ABAG Board consist of elected representatives from many counties and cities of the region and their decisions reflect the decisions of these voter-selected officials. See also Master Response A.1 regarding local land use control.

Letter C233 Kent Hagen (4/22/2013)

- C233-1: Please see Master Response B.1 regarding population projections.
- C233-2: The MTC and ABAG Board consist of elected representatives from many counties and cities of the region and their decisions reflect the decisions of these voter-selected officials. See also Master Response A.1 regarding local land use control.
- C233-3: Please see Master Response C regarding requests for extensions of the public comment period.

Letter C234 Susan K (5/2/2013)

- C234-1: Open space is not necessarily protected as it also includes undeveloped lands. The comments on the No Project alternative are correct. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C235 John Parnell (5/16/2013)

- C235-1: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.
- C235-2: See Chapter 2.2 of the Draft EIR for an analysis of and mitigation measures for impacts on air quality.
- C235-3: Please see Master Response G regarding water supply. In addition, the decision to use desalination as a water source would be solely the decision of MMWD and is not advocated for or required by the proposed Plan. The current MMWD Urban Water Management Plan indicates adequate water supplies through the year 2035 without a need to resort to desalination. The proposed Plan would result in essentially the same year 2040 population as under the No Project alternative - a three percent increase, with the proposed Plan resulting in 500 more households in Marin County than under the No Project scenario. Given the water supplies indicated by MMWD, it is extremely unlikely that additional water supplies will need to be acquired due to growth under the proposed Plan. Moreover, in August of 2010, the District adopted Ordinance 420, which states that the District shall not approve construction, or financing for construction, of a desalination facility unless such construction is approved by a majority of District voters, voting in an election held within the District's service area for that purpose.
- C235-4: Please see Master Response E regarding sea level rise and chapter 2.5 (Climate Change and Greenhouse Gases) in the EIR.
- C235-5: See Chapter 2.10 of the Draft EIR for an analysis of and mitigation measures for impacts on visual resources. Also note that all discretionary projects are subject to the approval by applicable local jurisdictions and must adhere to all design guidelines, permits, impact fees, and other requirements imposed by such jurisdictions; see Master Response A.1 on local land use control. In addition, please note that the proposed Plan's land development pattern would result in around only 500 additional households in Marin County by 2040 in comparison to the No Project alternative (see Table 3.1-3); that is, much of the growth in Marin is expected to occur regardless of the Plan due to regional growth; see Master Response B.1 regarding population projections.
- C235-6: MTC and ABAG are not proposing implementation of a Vehicle Miles Traveled (VMT) tax as part of the proposed Plan. The VMT tax was included in Alternative 5, the Environment, Equity and Jobs Alternative, as per the direction of the stakeholders who developed that alternative. The VMT tax is only a consideration as a component of Alternative 5. It is not being considered as a part of the proposed Plan, but commenter's opposition to the VMT tax is acknowledged. If a VMT tax is pursued, many details of implementation and the possible effects would be evaluated further.

C235-7: The MTC and ABAG Board consist of elected representatives from many counties and cities of the region and their decisions reflect the decisions of these voter-selected officials. Note that implementation of the proposed Plan is at the discretion of local jurisdictions; MTC and ABAG cannot “require” anything regarding land development. See Master Response A.1 for more information on local land use control.

Letter C236 Valorie Van Dahl (5/15/2013)

C236-1: Commenter’s opposition to the proposed Plan is noted. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt. Priority Development Area locations are designated by local jurisdictions, not by MTC and ABAG. See Master Response I regarding the PDA designation process.

C236-2: See response C235-5. Commenter’s opposition to the proposed Plan is noted. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C237 Byrne Mathisen (5/14/2013)

C237-1: Please see Master Response C regarding requests for extensions of the public comment period.

C237-2: Please see Master Response A.1 regarding local control over land use as well as Master Response A.3 regarding the programmatic nature of this EIR. In addition, see Chapters 2.7 (Geology and Seismicity) and 2.9 (Biological Resources) for the analysis of these issues and related mitigation measures, which cite existing State laws require site-specific analyses. Future second-tier projects must comply with CEQA; implementing agencies will consider localized biological resource and geology concerns during the administrative process associated with such future second-tier projects.

C237-3: The Commission and ABAG Board consist of elected representatives from many counties and cities of the region and their decisions reflect the decisions of these voter-selected officials. See also Master Response A.1 regarding local land use control.

C237-4: Please refer to the Draft EIR Chapter 2.6, Noise, which provides a thorough analysis of the potential noise impacts of the proposed Plan as well as provides adequate mitigation measures to combat these impacts. See also Master Response A.3 regarding the programmatic nature of this EIR.

C237-5: General concerns regarding property values are an economic issue not a physical impact on the environment that must be addressed in an EIR pursuant to CEQA.

C237-6: Typically public services are the responsibility of local jurisdictions and are funded through sales and property tax revenues and impact fees. Development under the proposed Plan will be subject to all local regulations and fees. See Master Response A.1 regarding local land use control. See also chapters 2.12 (Public Utilities and Facilities) and 2.14 (Public Services and Recreation) regarding impacts relating to public facilities and services.

C237-7: Plan Bay Area in fact devotes a significant portion of its budget to operating and maintaining the existing roadway system. The Draft EIR, on p. 1.2-49, notes that the proposed Plan

allocates over 79 percent of its budget to committed projects, which include many highway and roadway projects. In addition, 87 percent of all projected revenues are dedicated to operations and maintenance of the existing transit system and roads and bridges. “Compared to Transportation 2035, the proposed Plan Bay Area would spend a higher percentage of its budget on transit and roadway operations and maintenance, less on expansion of transit network, and roughly the same percent on road and bridge expansion.” In addition, as Table 1.2-10 of the Draft EIR shows, the proposed Plan will increase road and bridge operations and maintenance from 30 percent of the overall Transportation 2035 budget to 32 percent of the Plan Bay Area budget, an increase of \$28 billion (see updated numbers in Section 2.2 of this Final EIR); these funds are available due to a decrease in the proportion and amount of money to be spent on transit system expansion compared to the last RTP. In light of this transportation investment strategy, the proposed Plan clearly supports a continuation of personal automobile use. MTC must fund a transportation system that serves a growing population and many lifestyles while hitting targets assigned by the State, and this requires supporting transit as well as roadway systems.

The proposed land use pattern attempts to concentrate growth within transit-served locations and reducing parking requirements—which can be expensive or logistically impossible to follow in an infill setting—is meant as a way to incentivize such development and to increase transit usage given its more efficient use of existing roadway capacity and lower production of per capita greenhouse gas emissions. Ultimate decisions regarding the amount of parking to require for a specific future project rests with the local jurisdiction with discretionary local land use authority over its approval. See Master Response A.1 regarding local land use control.

- C237-8: Please see Master Response B.2 regarding the feasibility of the proposed Plan’s Priority Development Areas.
- C237-9: Such a request is beyond the scope of this regional-scale, program EIR. See Master Response A.3 for more information on specificity of program EIRs. Further information on the programmatic nature of this environmental document can be found on page 1.1-4; additional information regarding the Draft EIR’s emphasis on regional impacts can be found on page 2.0-1. However, it should be noted that second-tier plans and projects proposed to implement the proposed Plan must comply with CEQA and are subject to the discretionary land use authority of the implementing agencies. See Master Response A.1 regarding local land use control.
- C237-10: CEQA is designed to provide substantial opportunities for input from responsible agencies, trustee agencies, other interested agencies and organizations, as well as the public. CEQA, therefore, by its own terms provides an opportunity for third party review and comments. It should also be noted that in preparing this EIR, MTC and ABAG worked with a number of other agencies, such as the Bay Conservation and Development Commission, the Bay Area Air Quality Management District, and the California Air Resources Board, and expert consultants to ensure the validity of the analysis included herein.
- C237-11: Plan Bay Area is required to adhere to the GHG emissions reductions targets established by SB 375. Consistent with SB 375, the GHG emissions target CARB assigned MTC and ABAG requires reductions, when measured on a per capita basis relative to 2005, beyond those achieved by “new vehicle technology and by the increased use of low carbon fuel” (SB 375, Section 1(c)). See also Master Response D.1 regarding GHG emissions for SB 375.

- C237-12: Please see Master Response D.1 regarding the regional greenhouse gas emissions reductions for land use and transportation planning sectors under SB 375.
- C237-13: MTC and ABAG believe this EIR provides an adequate assessment of the proposed Plan's environmental impacts as required under CEQA.

Letter C238 Kevin Moore (5/16/2013)

- C238-1: Please see Master Response C regarding requests for extensions of the public comment period. Commenter's opposition to the proposed Plan and support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.
- C238-2: See Master Response B.1 regarding the population projections. PDAs are nominated and planned voluntarily by local jurisdictions, not selected by MTC or ABAG; see Master Response I regarding the PDA designation process. It is the responsibility of that local jurisdiction to comply with CEQA and approve or deny future second-tier projects within their discretionary land use authority based on site-specific considerations. See Master Response A.1 regarding local land use control.
- C238-3: See response C238-2. Also this is a regional-scale program EIR and such a request is beyond its scope. See Master Response A.3 for more information on specificity of program EIRs. Further information on the programmatic nature of this environmental document can be found on page 1.1-4; additional information regarding the Draft EIR's emphasis on regional impacts can be found on page 2.0-1.
- C238-4: See responses C238-2 and C328-3. Also see Chapters 2.12, and 2.14 of the Draft EIR for its analysis of and mitigation measures for impacts on public utilities and public services, respectively.
- C238-5: See responses C238-2, C328-3, and C238-4.
- C238-6: Please see Chapter 2.12 of the Draft EIR and Master Response G regarding water supply. Most of the water supply issues under the proposed Plan would be the result if population growth which will occur regardless of the proposed Plan; see Master Response B.1 on population projections.

In addition, the decision to use desalination as a water source would be solely the decision of MMWD and is not advocated for or required by the proposed Plan. The current MMWD Urban Water Management Plan indicates adequate water supplies through the year 2035 without a need to resort to desalination. The proposed Plan would result in essentially the same year 2040 population as under the No Project alternative - a three percent increase, with the proposed Plan resulting in 500 more households in Marin County than under the No Project scenario. Given the water supplies indicated by MMWD, it is extremely unlikely that additional water supplies will need to be acquired due to growth under the proposed Plan. Moreover, in August of 2010, the District adopted Ordinance 420, which states that the District shall not approve construction, or financing for construction, of a desalination facility unless such construction is approved by a majority of District voters, voting in an election held within the District's service area for that purpose.

- C238-7: This EIR analyzes the potential significant impacts of the adoption and implementation of the proposed Plan Bay Area (proposed Plan), which is the update to the 2009 Regional Transportation Plan (RTP) and the new Sustainable Communities Strategy (SCS) for the San Francisco Bay Area. MTC is required to adopt an RTP including an SCS pursuant to SB 375; MTC is required to adopt an RTP pursuant to federal and state planning requirements. Please see Master Response A.1 regarding local control over land use.
- C238-8: Please refer to the Draft EIR Chapter 2.5, Climate Change, as well as Master Response E regarding sea level rise.
- C238-9: The EIR is required to assess GHG emissions at a regional level, as it does in Chapter 2.5 of the Draft EIR. As a result of the proposed Plan, GHG emissions could rise in some locations but the EIR found that it would result in regional decreases in GHG emissions; see the analyses of Impacts 2.5-1 and 2.5-2.
- C238-10: Please see Master Response B.1 regarding population projections.
- C238-11: MTC and ABAG have no local land use authority and cannot compel a jurisdiction to adopt or implement Plan Bay Area; see Master Response A.1 for information on local land use control.
- C238-12: Commenter's support for the No Project alternative is acknowledged. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

Letter C239 James Holmes (5/10/13)

- C239-1: Please see Letter A8 from the City of Larkspur and MTC and ABAG's responses thereto. It should also be noted that second-tier plans and projects proposed to implement the proposed Plan must comply with CEQA and are subject to the discretionary land use authority of the applicable implementing agencies. See Master Response A.1 regarding local land use control.
- C239-2: Please refer to the Draft EIR, Chapter 2.5, Climate Change, as well as Master Response E for more information regarding sea level rise. In addition, the EIR is an environmental review document that thoroughly analyzes the potential environmental impacts as a result of the proposed Plan on the programmatic level. See Master Response A.3 regarding the programmatic nature of this EIR. Second-tier plans and projects proposed to implement the proposed Plan must comply with CEQA and are subject to the discretionary land use authority of the applicable implementing agencies. See Master Response A.1 regarding local land use control.
- C239-3: MTC and ABAG acknowledge that the proposed Plan includes incentives that may encourage local jurisdictions to implement that land use vision included in the proposed Plan. The One Bay Area Grant program, which account for 4.9 percent of revenues in the proposed Plan, requires that either 70 or 50 percent, depending on the county, of a county's OBAG funds be spent in or proximate to a PDA. However, local jurisdictions must comply with CEQA, notice and hearing requirements, and other applicable laws. Therefore, the public will have a continued opportunity to participate in local second-tier decision making

related to the proposed Plan. Please see Master Response A.1 regarding local control over land use and Master Response A.2 regarding CEQA streamlining.

C239-4: It is beyond the scope of this EIR to evaluate projects other than Plan Bay Area; this comment refers to a past decision on a separate project involving both the City of Larkspur and MTC.

C239-5: As the proposed Plan is a regional level plan, the impacts were evaluated on a regional scale. It is beyond the scope of the EIR to evaluate impacts on an individual project or jurisdiction level basis. See Master Response A.3 for more information on specificity of program EIRs. Further information on the programmatic nature of this environmental document can be found on page 1.1-4; additional information regarding the Draft EIR's emphasis on regional impacts can be found on page 2.0-1.

Future second-tier projects must comply with CEQA; implementing agencies will consider localized traffic and congestion concerns during the administrative process associated with such future second-tier projects. See Master Response A.1 regarding local land use control. It should also be noted that some of these comments are on the Larkspur Station Area Plan, a policy document of the City of Larkspur, and beyond the scope of this EIR.

C239-6: MTC and ABAG believe that the proposed mitigation measures for the proposed Plan are adequate, as presented in the Draft EIR, Chapter 2.1, Transportation. See also response C239-5.

C239-7: The proposed Plan addresses regional-level transportation investments and does not engage the details of how local transit operators work with existing land use. Furthermore, neither MTC nor ABAG have local land use control; see Master Response A.1. As a result, Plan Bay Area provides a blueprint for land development that could be supported at a broad level by the its transportation investment program, but the details of implementation are up to local jurisdictions, transit agencies, and county-level transportation authorities.

See chapters 2.12 (Public Utilities and Facilities) and 2.14 (Public Services and Recreation) regarding impacts relating to public infrastructure. See also Master Response A.1 regarding local land use control.

Pursuant to SB 375, an SCS must identify “areas within the region sufficient to house all the population of the region, including all economic segments of the population...” (Gov. Code § 65080(b)(2)(B)(ii).) The proposed Plan does so by producing a land use pattern that will accommodate HCD's Regional Housing Needs Determination (RHND) and through ABAG's and MTC's efforts to support additional affordable housing production. This includes Chapter 6 of the Plan, which identifies strategies for facilitating greater affordable housing preservation and production in the region. Many of these efforts require policy changes at the state or federal level that are beyond the control of the regional agencies, who will act as advocates for these changes. The regional agencies are providing more direct support for affordable housing through the Transit Oriented Affordable Housing (TOAH) fund, which supports affordable projects in Priority Development Areas and the identification of Affordable Housing as an allowable use for future Cap and Trade funds. See also Master Response B.2 regarding feasibility of the proposed Plan's PDAs.

C239-8: MTC and ABAG believe this EIR provides an adequate assessment of the proposed Plan's environmental impacts as required under CEQA. Localized "life-quality issues" are beyond the scope of this programmatic EIR. Local jurisdictions will consider these types of localized issues as they exercise their discretion over future second-tier projects. See Master Response A.1 regarding local land use control.

Letter C240 Debra England (5/16/2013)

Commenter's opposition to the proposed Plan is noted. The decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt. The proposed Plan was prepared in a manner consistent with the requirements of SB 375 and other applicable laws. MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR. The proposed Plan does not override local land use control. See Master Response A.1 regarding local land use control.

Letter C241 Stephen Nestel (6/13/2013)

See responses to Letter C98.

Letter C242 Peter Singleton (6/7/2013)

This letter was submitted on June 7, 2013, and contains corrections to C187, the commenter's original comment letter. The commenter recognizes errors that undermine the arguments in the original comment letter. Regardless, this Final EIR provides complete responses to C187. This revised letter C242 is included in the record; however, it raises no new environmental issues to which a response is required.

See comment letter C187 and responses to Letter C187.

2 (Introduction by Joan Chaplick not reported.)

3 (Presentation by Carolyn Clevenger not
4 reported.)

5 JOAN CHAPLICK: Okay. Thank you for your
6 presentation, Carolyn. And now, we will start the
7 public comment. So I will be reading off names in
8 groups of three, and I'd like you to line up behind the
9 microphone. Ursula will be keeping time, so if you
10 approach the two minute mark, I'll just give you a brief
11 hand signal to wrap up your remarks.

12 If you do have additional comments beyond
13 your two minutes that you need, please remember, you can
14 provide comments in writing today, or by email, mail, or
15 fax, as Carolyn showed on the slide. So with that we
16 are going to get started. And I please ask that you
17 speak slowly so that our court reporters can get your
18 information down accurately.

19 So let's start with Peter Hensel,
20 followed by Richard Hall, and Clayton Smith. So if you
21 could start, your name and where you are from.

22 PETER HENSEL: I'm Peter Hensel, and I live in
23 Corte Madera. And just as a little perspective, I'm
24 definitely not against affordable housing. I think we
25 need more of it, but it needs to be dispersed through

Page 5

1 the community. I consider myself an environmentalist, so
2 this, I tackled this gigantic document, a thousand
3 pages, as best I could with limited time, concentrating
4 mainly on biological and water resources, because that's
5 all the time I had.

D1-A1

6 But what struck me, you know, on page 39
7 of the biological resources report, there's a footnote
8 that defines a certain section of Federal Endangered
9 Species Act. It says, a taking is defined at section
10 nine of that act, as broadly defined to include
11 intentional or accidental harassment or harm to
12 wildlife. Now, in the extreme, that could be something
13 even as disastrous as killing wildlife.

14 So, if you are a modern day land-use
15 planner or developer, what you want to do is mitigate.
16 They have a word for that, LSM, or an acronym, I should
17 say, it means less than significant impacts. So, this
18 puts planners and developers in a kind of quandary,
19 because, let's say -- and again, this is from the
20 document, page 60, of biological resources.

D1-A2

21 In the event that construction with the
22 needs to operate in any water course with flowing or
23 standing water, a qualified biologist resource monitor
24 shall be present at all times to alert construction
25 crews to the possible presence of California red legged

1 frogs, nesting birds, salmon heads, or other aquatic
2 species at risk during construction operations.

3 Well, I got kind of a laugh out of that,
4 actually, because one hopes that the state planners
5 would provide a chair for this guy sitting there all day
6 long watching the action. Am I?

7 JOAN CHAPLICK: Yes, that's time.

8 PETER HENSEL: Afraid so.

9 JOAN CHAPLICK: If you could please wrap up
10 your remarks.

D1-A3 11 PETER HENSEL: Well, let me just wrap it up.
12 So, in other words, we need to do some more work on the
13 people impacts of this report, and especially around the
14 water, because -- and this will be my last sentence. I
15 plugged into the California water agencies, they have a
16 website, and they say that Central Valley farmers are
17 going to get five, excuse me, 20 percent of the water,
18 their contract water this year. And I said, my
19 goodness, why are we planning for all these people under
20 that scenario?

21 JOAN CHAPLICK: Thank you for your comments.

22 Following our next commenter is Clayton
23 Smith, could come in line, and then I have Carolyn
24 Lement.

25 Sir.

1 RICHARD HALL: Hi, I'm Richard Hall, and I
2 live here in San Rafael, and I represent a group called
3 Quiet and Safe San Rafael. We are a group of residents
4 spanning ten neighborhoods. And, first of all, I want
5 to say, this is a big plan. It has big implications.
6 And I also wanted to sort of bring up a point of fact, I
7 kind of quickly went through obviously a big plan, as I
8 mentioned, this has more implications for Oakland,
9 San Francisco, some of the big cities.

D1-B1

10 Well, I think it's worth calling out that
11 right here in Civic Center, where we are sitting today,
12 the plan here and the PDA that manifests it, increase
13 the population by 55 percent in just a small half mile
14 radius zone, right here. In downtown San Rafael the
15 impact is 58 percent population increase.

16 So I found that sort of the way this was
17 presented was very dismissive of the actual impact. And
18 I think this is, what's really happening is the
19 residents I'm talking to, right here are impacted, are
20 feeling like we are just waking up to a major impact on
21 our life. We live here. We have vested interest in
22 this being a great place to live. We want to have a
23 voice. And we have consistently found that that voice
24 is not being heard.

25 And through -- we have met with our town

1 council, we packed the council chambers was overflowing
2 with proponents to the PDA plan, stationary plan, yet
3 our council voted five nothing against all those people.
4 We are at out wit's end to work out how are we meant to
5 object to the PDA, the general plan, the plan that
6 basically almost all of us disagree with that's based on
7 these transit oriented development principles, that we
8 don't just buy into this vision.

D1-B2

9 And I think many of us here don't buy
10 into the transit oriented development vision. We think
11 there's an alternative way. We think there's many
12 things you haven't considered. First of all,
13 telecommuting is increasing, cars are green, gas
14 emissions have reduced, and preempted, they are making
15 radical steps forward there. There's changing of car
16 technology that might start to emerge, and I've
17 explained this one, in the next five or ten years.

18 So these are all things that can be taken
19 into account that we don't have such radical impacts on
20 our everyday lives.

21 JOAN CHAPLICK: And could you wrap up your
22 comments, please?

D1-B3

23 RICHARD HALL: Sure. You have basically given
24 us one alternative, no project, but I'm told by people,
25 if we choose no project you still have to get to choose

1 an alternative. It feels like you haven't given us a
2 choice. No project is no project. There is no
3 (inaudible) choice that says no project. We would like
4 to say no project, period, and eliminate the PDA here in
5 San Rafael and North San Rafael. Thank you.

6 JOAN CHAPLICK: Thank you for your time.

7 Our next commenter will be followed by
8 Carolyn, and then Nona Dennis.

9 CLAYTON SMITH: Yeah, my name is Clayton
10 Smith, I'm from Mill Valley. You know, I look at your
11 document, it starts with what I consider to be
12 questionable scientific theories concerning the effects
13 of CO2 on what is now referred to as climate change. It
14 moves on, continues with population increases search
15 that contradict those made by Department of Finance at
16 the state level.

17 These are used to justify the overthrow
18 of local control concerning zoning and development.
19 And it culminates, interesting enough, on the last page
20 of your summary document with this vast expenditure.
21 Billions and billions of dollars on all these
22 transportation items. And I look at this, and what I
23 immediately sense, and I immediately feel, is cronyism.
24 All this money, and I, I look at what the state does
25 with the money we give it today, and we get big

1 bureaucracy. We get an overgrown and overpaid state
2 government, and we have almost no real value in exchange
3 for our tax dollars.

4 What we are getting back is substandard
5 government. And this I think is just more of it. This
6 is billions, hundreds of billions of dollars, most of
7 which is going to go into the coffers of the bureaucracy
8 and all those people that feed off this bureaucracy.
9 All the contractors, all the politicians, the financing
10 companies, and all the rest of it.

D1-C5

11 And it brings to mind, and my culminating
12 statement being, when Mussolini was asked to define
13 fascism, his definition of fascism was, everything in
14 the state and nothing out of the state. Again,
15 everything in the state and nothing outside of the
16 state. And I would argue that this document, One Bay
17 Area, is fascistic. It is a statement that we are now
18 all basically in the state, as described by these
19 bureaucrats and unelected officials, and that none of
20 our life, the life we have enjoyed in this country, will
21 be able to be permitted outside of the state.

22 And I think it's up to the duty of every
23 person who loves this country and who basically loves
24 the freedoms that are the gift of this country, will do
25 what they can to oppose such an opus document. Thank

Page 11

1 you.

2 JOAN CHAPLICK: Thank you for your comment.

3 And following Nona Dennis we'll have Susan Kirsch.

4 CAROLYN LEMENT: Carolyn Lement, San Rafael.

5 Two boys escaped from the Nazis, and one of them got to
6 go to the University of California and then get his
7 master's degree from Stanford University in medicine.
8 And then the army that sponsored that sent him back to
9 Germany. And he finished his service there and came
10 back and there was no place to live. My father lived in
11 a chicken coop after the war.

12 Affordable housing, of course, is
13 necessary. Better plan, of course, is necessary. I've
14 never met anyone against affordable housing. If you are
15 here, please come introduce yourself. That said, we
16 have a variety of issues and I'm just going to speak on
17 a potpourri of them about the EIR. First of all, we
18 need more time to consider this carefully. The staff is
19 doing it full time. Why isn't this meeting being held
20 in the evening so we can get people here? My computer
21 is still downloading 1,300 pages. It hasn't finished
22 downloading the report yet.

23 Secondly, housing is responsible for 40
24 percent of greenhouse gases. What's out there now is
25 green. All this building is not green. No matter what

Page 12

1 materials you use and how you dispose of the waste in
2 building it, it's not green. Twenty units per acre is
3 appropriate in our county. We are not urban. And you
4 can't go five miles out into deep country below
5 landslides and put more people at risk.

6 The places that have been chosen in Marin
7 County are dangerous. They are either toxic sites, they
8 are next to cell phone tower farms, they are next to
9 freeways where you double the chances of your children
10 having autism and asthma, according to 93 studies that I
11 downloaded. This is not examining the community's
12 impacts. The EIR is insufficient in this way and the
13 process has been scripted from the beginning.

14 So the process has been incomplete,
15 exclusive, and too fast for us. The assumptions behind
16 it are wrong. We have two freeway projects now in
17 Marin, no one is living in them. They failed. And
18 lastly, we have the water. The international standards
19 for transit oriented development is spoke and wheel.
20 It's not cramming people next to a freeway where they do
21 not want to live.

22 So far all this and more reasons, no
23 project, give us an alternative, let us develop an
24 alternative. It's going to taking more time in Marin
25 than we have been given. Thank you.

1 JOAN CHAPLICK: Thank you for your comments.

2 And let's see. We have Nona, then we
3 have Susan Kirsch and Linda Rames.

4 NONA DENNIS: I'm Nona Dennis, I'm
5 representing Marin Conservation League, and these are
6 our very preliminary comments on the EIR itself. I have
7 five comments. The first is that --

8 JOAN CHAPLICK: If you could use the
9 microphone. We can't hear you.

10 NONA DENNIS: Okay. Sorry. Thank you. Okay.
11 The first comment, is that as far as it goes, the EIR, I
12 must say, stands in sharp contrast. It's subjective.
13 It's comprehensive. It misses some major points, which
14 we are going to be making, but in comparison with the
15 plan itself, it is refreshing because it does identify
16 the areas of controversy, it identifies the significant
17 unavoidable impacts. It presents information
18 objectively, whereas the plan itself is sugar coated and
19 written through rose colored, I'm sorry, colored
20 glasses.

21 So anyway, that's as far as it goes. So
22 I've heard -- so main comment on the EIR, is that it's
23 based on projections that now are in question. We are
24 aware that there are discrepancies between the numbers
25 projected by ABAG and those by the Department of

Page 14

1 Finance. We don't know, some people are familiar with
2 those, the differences, the explanation of the
3 differences, so forth, but it's our understanding that
4 the entire EIR plan itself are premised on projections.
5 And you have a deadline, you have no time to correct
6 those.

7 When will we see a correction of those
8 projections, such that all these assumptions underlying
9 the EIR can be made consistent with projections that are
10 accepted? Are we going to have to wait four years for
11 review of the plan? The plan, the EIR itself does deal
12 fairly well with directives of the transportation
13 project, such as the displacement of open space and so
14 forth. It fails to, however, address the long term
15 indirect effects of the actual rate of growth, economic
16 growth as projected.

D1-E2

17 This will have to be, those indirect
18 impacts are not addressed. The impact of sea level rise
19 should be carried beyond the mid century. And we will
20 have some more comments to make on deficiencies in the
21 EIR. Thank you.

D1-E3

22 JOAN CHAPLICK: Thank you for your comment.
23 Next we have Susan Kirsch, Linda Rames, and then Al
24 Dugan.

25 SUSAN KIRSCH: Good morning, Susan Kirsch,

D1-F1

1 Mill Valley, California, a 34-year-resident of
2 Mill Valley. I want to make three comments regarding
3 the EIR and its measurements with CEQA. You know, on
4 the Executive Summary, page two, it talks about one of
5 the requirements of CEQA, as you mentioned in your
6 opening comment, is to inform decision makers and
7 members of the public as to the range of the
8 environmental impacts on the proposed plan.

9 I would hold that this project has been
10 grossly inadequate in terms of the people who are
11 representing any of us in our communities, bringing
12 forward being informed, educated and engaged around
13 this. So, at this point at least, the project is
14 failing on informing and engaging the public.

D1-F2

15 The second part of this is around picking
16 the environmentally superior alternative. And in an
17 example of the kind of double speak and the kind of
18 manipulation that happens in this, what it says in
19 Executive Summary, page nine, is that if the no project
20 alternative is identified as the environmentally
21 superior alternative, then the EIR must identify another
22 alternative from among the alternative allies.

23 However, project -- the no project
24 alternative is the one that continues to honor local
25 control through general plan and maintains that strength

1 of local communities working in collaboration but
2 holding power with local communities, which many of us
3 are in favor of.

D1-F3

4 The other thing that I want to comment
5 on, is many groups have been holding great promise for
6 this plan thinking that it's going to provide affordable
7 housing. And I'd like to point out from page 108, in
8 terms of hidden targets for equitable access, that in
9 fact, instead of hitting equitable access, the wording
10 from page 108 is that this plan moves in the wrong
11 direction.

12 The share of household income needed to
13 cover transportation and housing costs is projected to
14 increase to 69 percent for low income and lower middle
15 income residents during the Plan Bay Area period. And
16 further, transportation cost from page 109 will change
17 by one percent. This project is based on faulty
18 assumptions, faulty numbers, and a faulty process. It
19 should be slowed down and reconsidered.

20 JOAN CHAPLICK: Thank you for your comment.
21 Next we have Linda and Al Dugan, followed by Harry
22 Brophy.

D1-G1

23 LINDA RAMES: Good morning, I'm Linda Rames,
24 I'm a resident of Mill Valley. I simply have one
25 comment to make. Don't you think it's a little putting

Page 17

1 the fox in charge of the hen house to have MTC doing the
2 EIR? They are hardly impartial. Thank you.

3 JOAN CHAPLICK: Thank you for your comment.
4 You can adjust the volume from the back.

5 AL DUGAN: All right. My name is Al Dugan and
6 I represent the Novato Homeowner's Association. And
7 basically, I have three main issues, and they are with
8 ABAG, which is the basis of this whole report is based
9 on ABAG projections. Number one, the May 16th date is
10 just not sufficient time for us to be able to analyze
11 and give an independent review of the ABAG numbers and
12 this report. It's just insufficient.

13 I also note that ABAG used the DFO
14 migration factor from 2007 instead of the most recent
15 Department of Finance migration numbers, and that makes
16 a significant difference between the Department of
17 Finance numbers and the ABAG numbers. And then,
18 finally, ABAG top down planning does not have an
19 adequate way to deal with an anomaly or an outlier like
20 Marin.

21 Dr. Levy reviewed the total growth of the
22 Bay Area but clearly stated at a recent ABAG meeting, he
23 was not involved in and did not review the allocation
24 process to the jurisdictions. The 18,400 jobs and
25 33,000 population growth by 2040 makes no sense for

1 Marin. The ABAG numbers are 61 percent higher than the
2 Department of Finance numbers for the Bay Area, but they
3 are 400 percent higher than the Department of Finance
4 numbers for Marin. This is an obvious anomaly and a red
5 flag.

6 Thank you.

7 JOAN CHAPLICK: Thanks for your comment.

8 I have Harry Brophy next, followed by Ray
9 Day.

10 Did you, ma'am, did you fill out a
11 speaker card, or did I accidentally not call your name?

12 (Discussion had off the record.)

13 JOAN CHAPLICK: It's in the queue. So you just
14 have to stand. Please, sir, go ahead.

15 HARRY BROPHY: My name is Harry Brophy. I'm
16 from Novato. I have nothing against housing. That
17 isn't why I'm here. In a way, it, it might effect it,
18 but what I want to talk about is the water situation in
19 Novato. I've looked at some of reports. I have a book
20 full here that I haven't quite finished yet, but Novato
21 is going to have problems with water. They have 6,100
22 acres of feet they are using now, and ABAG projects
23 12,000 feet by 2020. That's almost double.

24 In Novato, people at ABAG has projected
25 is up around 64,000, that's way high. And what I'm

Page 19

1 getting at is, there's one pipe now that brings water
2 into Novato. It's a 30 inch main. I went up and
3 checked it, it comes from Sonoma. We are going to get
4 another pipe, but in 2009, due to financial constraints,
5 that pipe is out of the game.

6 So they have one way of getting water to
7 Novato. And more than anybody in this room, I know what
8 happens when a pipe full of water breaks. And don't
9 tell me it can't, because I was in charge of the City of
10 San Francisco the day that Loma Prieta had all the pipes
11 break in the marina. We used the bay. You don't have
12 that option right at this time.

13 We could set up a system where you could
14 use above ground water, I could do that for you, but as
15 it is now, the amount of water coming in is not
16 sufficient. All these statements in this book are taken
17 from North Marin Water District, in conjunction with
18 talking with Krista Gabriel, he's the head engineer, all
19 these things are true, and it comes down to where they
20 tell you, by the year of 2020 when there's going to be a
21 20 percent reduction by the State of California that's
22 mandatory, the water you have now won't be enough.

23 You are going to have less water up
24 there. You are going to have more people. You are
25 going to have a major problem when you do the EIR. And

D1-I2

1 another thing about the EIR, I would like it to be
2 impartial. So I don't know why Novato could be the lead
3 on the EIR when they are in cahoots with ABAG trying to
4 put these buildings up in Novato. It's got to be
5 impartial, because they are siding together.

D1-I3

6 They are not going to look at all these
7 facts. They are just going to do like one did, do we
8 have enough water? Yes. End the game. Let's look at
9 it from the start of Maravella all the way through where
10 it comes down. There's nine water contractors between
11 Russian River and lower Marin. They all have this water
12 problem. And it's going to get worse.

13 Thank you.

14 JOAN CHAPLICK: Thank you for your comments.

15 Following our next speaker, Ray Day, we
16 have Margaret Kettunenzesar, followed by Pam Drew.

D1-J1

17 RAY DAY: Hi, I'm Ray Day from Marinwood. And
18 I'm just representing myself, so don't take this to mean
19 that I represent the entire Marinwood area. I just
20 wanted to say that I agree with the prior speakers
21 indicating that the EIR focuses on transportation, jobs,
22 air pollution, and ignores many things that are really
23 important to the communities here in Marin.

D1-J2

24 And especially one thing, as a result of
25 SB50, which really messed us up, because the impact on

1 schools, which are not permitted to be placed in the
2 EIR, as far as the impacts to the local school
3 districts. Giving example, in the, in Marin County
4 here, 70 percent of the county's affordable units will
5 be, are planned to be located in the Dixy School
6 District and concentrated there. Now, okay. Now, you
7 say so what's the impact of the affordable housing?

8 Okay. For example, I did a calculation,
9 over the 40 year life of the project it would mean about
10 14.8 million in tax revenues if it was done on a regular
11 affordable basis. That meaning that the county's
12 original plan of 20 percent affordable housing and then
13 the rest to be market rate housing. Right now what the
14 plan is on the existing PDA is to go ahead and have it
15 100 percent affordable housing with the owner being
16 bridge housing that is entitled then to not pay any
17 property taxes that would be going to the schools.

18 Okay. Now you say, what is the impact?
19 Okay. For the school districts, that would amount to
20 over the life, that would be 1.6 million that they would
21 receive from the project out of the funds that would be
22 sent to the schools, versus 3.8 million that they would
23 be entitled to.

24 So this is a problem, and I think that if
25 it's nothing else, it's put in as a informational item

1 to the public so they know what the impact is to there
2 local school districts, because otherwise it won't be
3 mentioned, they have no say in what is going on. And
4 this is a very important issue that hasn't been
5 discussed and should be contained in any of these plans.

6 Thank you very much.

7 JOAN CHAPLICK: Thank you for your comment.

8 And next we have Margaret.

D1-K1 9 MARGARET KETTUNENZESAR: Horrible would be the
10 use of the funds for urban areas. Unfortunately, in the
11 unincorporated areas of Marin, all population has been
12 added and creates an urban prophecy, which does not
13 exist. The very sad thing is the PDA's and the
14 information of location of affordable housing in
15 Southern Marin, where I live, is on flood plain. A
16 flood plain.

D1-K2 17 Climate change does is not addressed in
18 terms of the areas where the population is planned. The

D1-K3 19 population is assuming transit orientation, because
20 there is a Highway 101, which is inadequate and will be
21 inadequate for many years. Shoreline Highway is
22 impassible on weekends and sunny days. Shoreline
23 Highway is accessed by flooded -- accessed from the
24 bridge, the Golden Gate Bridge. There is no transit
25 facility throughout rural, semi-rural Marin.

D1-K4

1 We are impacting populations that are
2 planned. And it's unfortunate that an eagerness to gain
3 funds for transportation, a process which was designed
4 for urban renewal, which is desperately needed in parts
5 of the cities which surround the Bay Area. Common
6 change needs to be better addressed, and the impacts of
7 the unfortunate probability of very high FEMA insurance
8 on semi, on semi-rural populations and affordable
9 housing, needy people, seniors, these kinds of
10 considerations should be given a more economic -- that
11 aspect should be analyzed in the document. Thank you.

12 JOAN CHAPLICK: Thank you for your comment.
13 Next, Pam Drew, Jean Rieke, and Nancy Ocada.

D1-L1

14 PAM DREW: My name is Pam Drew, I'm from
15 Novato. And I don't represent any one of the three
16 lobbies that the Plan Bay Area has replaced democracy
17 with. I believe in climate change. I believe the globe
18 is warming. I believe we need to reduce GHG emissions,
19 but I do not believe that we need to lie to the
20 population in order to do that.

21 I do not believe that you, as officials,
22 have a role in telling the population exactly what they
23 are to do and when they are going to do it. Whenever I
24 first watched the Bay Area Plan it was that we had to
25 prepare for two million people, one million of whom were

Page 24

1 going to be nearby migration, and one million by natural
2 increase. That was when there was still immigration
3 going on.

4 Very very shortly, few months after that
5 little factoid was dropped, it was no longer seen in any
6 of the literature. It was just two million people. You
7 have to provide for two million people. Now, that's
8 excessive growth. That's excessive growth in the face
9 of all the DOF projections. And at the beginning you
10 said that you were using the DOF numbers, but in the end
11 we find that it's Steven Levi and a private corporation
12 that is putting out all of these numbers.

D1-L2

13 This is based on something that is wrong.
14 And if it's wrong from the very beginning it's going to
15 be wrong at the end. It needs to be, no. No option.
16 There is not enough water. You are encroaching on the
17 bay lands from the Cargill Salt Flats all the way up
18 here to Tam. Valley. This is a lobby between the
19 corporations, the environment lobby and the equity
20 lobby. I don't belong to any of those.

21 I'm a homeowner, and despite my race,
22 despite that the fact that I am white, I'm still
23 speaking for homeowners. For black homeowners, for
24 Hispanic homeowners, for homeowners of all sorts. And
25 we deserve to be heard. We haven't been heard and we

1 need to be.

2 JOAN CHAPLICK: Thank you for your comment.

3 We have Jean Rieke who is next, followed by Nancy Ocada,
4 and then Robert Chilvers.

5 JEAN RIEKE: Hi, I'm Jean Rieke from Larkspur.

6 And, first of all, one thing around affordable housing
7 that has troubled me, I really do think that most people
8 understand the need for affordable housing and do not
9 oppose it for any elitism, or anything else, but every
10 time I hear about people needing 60 percent of certain
11 peoples need to commute into the county for work, I'm
12 wondering if they are taking the statistics of the
13 number of people that live in the county that need to
14 commute out of the county for their work.

15 So, I think that has to be understood,
16 commuting in general is a big problem for everybody.
17 And the other thing is, just a more broad base concern
18 in two areas. One is that a little bit of it has the
19 not in my backyard background, also, which I do not
20 think that people that live in Marin County, at least in
21 my experience, feel elite. They feel like they want to
22 keep people from living here. For most of the people
23 that live here, it's taken quite a struggle to come and
24 live here.

25 I think that when you look around the Bay

1 Area and you see whether it's because of highway
2 construction or infilling of housing, or whatever it is,
3 and I know these are all very deep complex problems, you
4 look at arenas that are not very attractive. At least
5 not along the freeways. And going farther and farther
6 out now, because what we see seem to be forgetting is we
7 live in such an incredibly beautifully blessed natural
8 area. And, unfortunately, we have lost that along 80,
9 880, 580, south of San Francisco on 101.

10 What I see here is an opportunity to try
11 to find balance in the basic concepts by which thinking
12 is done over future plans. And we still have some of
13 the suburban rural nature in Marin, and Sonoma County,
14 and farther north. And I would like us to treasure that
15 and to find a way to balance out all these needs and
16 wants.

17 And last thing I have a real problem
18 with, again not to not respect all the hard work that
19 people do, but in general I'm a little bit opposed to
20 top down government, because I don't think one size fits
21 all. And I think that when you, when, every time we
22 take control out of the local hands we have more and
23 more and more of the risk, than in general, every day
24 peoples needs are not being served, as much as people
25 are trying to serve them

1 JOAN CHAPLICK: Okay. Thank you for your
2 comment.

3 Our next speaker, Nancy Ocada. Followed
4 by Robert Chilvers, and then Elizabeth Moody.

5 NANCY OCADA: Hi, my name is Nancy Ocada. I
6 live in Ross Valley. And I want to thank you for coming
7 here. I guess your staff, I hope that my comments
8 will -- I know that my comments will be included in some
9 document that will be buried somewhere, but I hope that
10 you pass on my comments to the appropriate people.

11 This project actually started in June of
12 2012, when you presented a draft DIR alternative for
13 review by joint MTC Plan ABAG Administrative Committee.
14 And on June 11, you released notice of preparation for a
15 30-day public review period. Somehow I wasn't aware of
16 this, otherwise I might have got involved a little
17 earlier. From June 20th to June 28th, you held regional
18 wide scoping meetings. I, unfortunately, didn't know
19 about those, so I couldn't attend.

20 On July 13th, of 2012, you presented your
21 final alternatives for review by the joint MTC Plan ABAG
22 Administrative Committee, in recommendation for
23 committee -- which you probably did approve of it.
24 Anyhow, I got involved in this in, when I attended a
25 meeting in San Francisco in January of 2012, oh,

1 actually it was 2011 that you started it. I'm sorry.

2 Anyhow, I was very surprised to find that
3 there wasn't a single person in the room in
4 San Francisco who was in favor of your plan. And I
5 certainly am not. These come from your scoping
6 alternatives. You say it's unclear that market dynamics
7 will support protected PDA growth. You need to assess
8 the market feasibility. I see businesses closing down
9 everywhere.

D1-N1.5

10 I am a small business advocate, and I
11 think we need more small businesses. And what this is
12 going to do is going to put more businesses out of
13 business. You're offering incentives of ABAG and CEQA
14 streamlining. That means let's cut down more trees. I
15 am against cutting down more trees. I'm against
16 destroying the habitat, which is being done everywhere.

D1-N2

17 And, finally, I believe and I support the
18 the no project alternative. Alternative number one,
19 which is a land use based on 2010 existing land use
20 conditions, continue existing general plans and local
21 zoning into the future, assume loose compliance with
22 urban growth boundaries and more green field
23 development.

D1-N3

24 And then in transportation, which there's
25 a lot of money being spent in that area, based on 2010

1 existing transportation networks and only include
2 projects that have either already received funding and
3 have environmental clearance as of May 1st, 2011. This
4 would be a much better alternative, and it's too bad
5 that so much money, when people are losing their homes
6 all around us, so much money has been spent planning a
7 process and not going to real jobs.

8 We really need to have real jobs. And
9 this planning process and the millions of dollars that
10 ABAG and MTC has spent is really a very sad situation.
11 So thank you very much for coming here, and I hope you
12 enjoy your day in Marin.

13 JOAN CHAPLICK: Thank you for your comments.
14 Robert Chilvers, followed by Elizabeth Moody, and then
15 Margaret Nan.

16 ROBERT CHILVERS: Rob Chilvers, President of
17 Annabel. Marin County is truly a very very special
18 place. It's the only county in entire United States
19 that has three national parks within its borders. One
20 of those, the Golden Gate National Recreation Area,
21 which is largely within Marin, is the second most
22 visited park in the entire national park system.

23 We also have almost 500 species of birds.
24 And there's very good reason for that. It's because we
25 have the open space, we have the trees, we have the

1 habitat. Well, how did Marin County, even now, after
2 all of the growth that's been around us in the entire
3 State of California, still maintain its beauty and its
4 open space and its habitat? By fighting.

5 We have had this fight many many times.
6 Marincello was proposed for the headlands and it was
7 squashed. The Vincent Silvera properties were slot to
8 be developed and that has been stopped. It's taken
9 citizen action for decades and decades to preserve it.
10 Now my backyard is the entire Bay Area, and Marin County
11 is a jewel for the Bay Area. In fact, it's a jewel for
12 the entire world.

13 Try to think of one other city as large
14 as suburban San Francisco that has anything like Marin
15 County, literally within walking distance of the city.
16 It doesn't exist anywhere, except here. We must
17 preserve it. How did we get to the point where we have
18 this beauty? The foresight of Burton and other
19 politicians who put these national parks and national
20 monuments together, the citizen activities of myself and
21 the people in this room, and other citizens, we have to
22 fight to keep it as beautiful as it is.

23 The proposal to build it, literally,
24 within walking distance of this hotel, 600 units in this
25 area, which is an architectural treasure, and which is

1 almost entirely single-family detached homes, it would
2 change the character of this very neighborhood
3 profoundly. And anybody that thinks that this SMART
4 train is going to have a station nearby is going to
5 alleviate traffic on 101, if you build 600 new units,
6 you are going to have at least a thousand new cars on
7 101 every day, and for multiple trips. So, totally
8 aggravate the traffic problem.

9 JOAN CHAPLICK: If you can conclude your
10 remarks, please.

11 ROBERT CHILVERS: I think that elected
12 representatives who support this growth do so at their
13 peril.

14 JOAN CHAPLICK: Thank you for your comment.

15 Okay. Elizabeth Moody, I believe is
16 next.

17 ELIZABETH MOODY: I strongly support the nine
18 Bay Area Planning. I've read the full plan but not the
19 EIR. Sixty percent of our workers come from out of the
20 county, making greenhouse gas raise, as well as the
21 unfairness for those families who lose time, and the
22 cost of travel, and the importance of this plan in
23 providing for the three areas of sustainability. The
24 environment, the economy with jobs connected with
25 transportation, and equity, it's just absolutely

Page 32

1 essential.

2 My three kids with their eight children,
3 my three kids could not afford to live here, even though
4 they worked here. And it has been very distressing for
5 me to see that this county is so wealthy and 82 percent
6 white, so I participate in ACE, Action for Coalition --
7 -- let's see. Action for Coalition Equity, which
8 stresses the discrimination in this county. And it is
9 absolutely essential that we do planning between, and
10 integrate the planning between the nine counties that
11 make up the region.

12 And it is, as far as all of the elements
13 of sustainability, with the protecting the environment
14 which the plan does, and it also continues to allow for
15 the local land use, fully local decision making. So
16 there's just no reason why we shouldn't cooperate,
17 coordinate, and integrate, so that we have a better
18 region and a better future.

19 JOAN CHAPLICK: Thank you for your comment.
20 Next we have Margaret Nan, and then Ann Spake, and Julie
21 Leitzell. Those are all of the comment cards I have,
22 so -- I have one more. So if anyone else is seeking to
23 speak, please let us know.

24 Margaret, you are up next.

25 MARGARET NAN: Hi, I'm a homeowner and also a

Page 33

1 long-term resident. I was raised in Marin County and
2 Sonoma County, I went to school here, and then I
3 returned after living in Los Angeles, New York, D.C.,
4 and lots of urban areas, and I do not want Marin County
5 to turn in to having some of these issues like urban
6 areas. Like a lot of people have moved, specifically to
7 Marin to enjoy the beautiful scenery and the nature.

8 I know I moved back to Marin, I think, I
9 thank my family for raising me here and being able to
10 have the privilege of living here. That being said, I
11 do believe it's inevitable and there needs to be
12 affordable housing of some sort placed in Marin County,
13 however, after living in Hamilton, was our first home,
14 we stretched to get in there, we stretched to get into
15 Marinwood, we are in our third home now in Lucas Valley,
16 after stretching, working really hard, my husband works
17 here and so do I, I feel like we have sacrificed so much
18 to live in this community, and I'm happy to do so, but I
19 don't think we should be giving away the farm,
20 necessarily.

D1-Q2 21 We have -- our kids go to public schools.
22 I believe in public school. We contribute to Kendale.
23 To put this additional pressure on the school, and I
24 talked to our local principal, and he actually was not
25 really concerned about the homes that were going to be

1 built, 700 units in Marinwood, Lucas Valley have been
2 proposed, he said that he was more concerned about Marin
3 Commons being taken off the board as source of tax
4 revenue.

5 So Marin Commons was sold to the county,
6 apparently, and they no longer have two million dollars
7 in school revenue annually. So here we are getting
8 squeezed from tax revenue from the schools and you are
9 going to put more kids in our schools and have less
10 resources. So that's certainly an issue. The other
11 thing is I've seen, even in my community in Lucas
12 Valley, for affordable housing. I've actually gone and
13 talked to Sharon McAdams at Upridge Housing, I think
14 it's very well run. I'm not against that.

15 What I'm against is putting in a lot of
16 affordable housing, having people from outside the area
17 coming here and taking advantage of that and having
18 less, less revenue. When I lived at Hamilton at the
19 Meadows I was told by police officers that police
20 officers wouldn't buy there, because they would rather
21 live in Vallejo, realize their 30 percent increase in
22 their home price, trade up, than being set with one or
23 two, three percent increase.

24 So what ended up happening, is you got a
25 lot of people from outside the Bay Area with limited

1 options that were put in there by the developers. So
2 you are identifying a set of people that you want to
3 move to this area, but those people will not buy there.
4 So I don't know what your solution is with that. I'm
5 certainly for it, but it needs to be done properly. And
6 I just don't like this being where it's going. And
7 needs to be more controlled.

8 JOAN CHAPLICK: And can you state your name
9 for the --

10 MARGARET NAN: Margaret Nan, I live in Lucas
11 Valley.

12 JOAN CHAPLICK: Our next speaker is Ann Spake,
13 and then we have Julie Leitzell, and Carol Sheerin.

14 ANN SPAKE: My name is Ann Spake, I'm from
15 Tam. Valley. I was carefully reading the EIR, and I
16 note that three parcel viable for potential development.
17 You were basically analyzing, calculating the
18 profitability of new development or redevelopment on
19 each parcel. I would submit that this profitability is
20 fundamental to the proposed plan, proposed alternative,
21 and it is profit over people.

22 We need to plan for housing that's
23 healthy for sensitive members of our community,
24 including young children, pregnant women, seniors, and
25 those who have compromised immune symptoms. You admit

Page 36

1 in your EIR that this plan is totally in contradiction
2 to that. The current plan has the most and over twice
3 the transportation projects exposed to mid century sea
4 level rise inundation in the no project alternative.

D1-R2

5 You say it exposes more residents and
6 more new residential development inundation by placing
7 people closer to the bay than the other alternatives.
8 The proposed plan does not provide the least
9 environmental impact in relation to air quality. The
10 EIR does not examine the effects on local or regional
11 air quality from specific land use and transportation
12 improvements in the proposed plan.

D1-R3

13 The proposed plan could cause a net
14 increase in emissions of criteria pollutants and PM10,
15 and diesel, MP TACs from on roll mobile sources compared
16 to existing conditions, and yet you considered it to
17 have no adverse impacts. The proposed plan when you
18 admit will cause a localized net increase of sensitive
19 receptors being located in TPP corridors where TACs and
20 fine particulate matters concentrations result in
21 elevating cancer risk.

D1-R4

22 The proposed plan will also increase TACs
23 and PM in disproportionately impacted communities
24 creating even greater health disparities and
25 environmental justice. Environmental justice person

1 noted that low income housing is being used as a buffer,
2 even as science advises against it. The Pacific
3 Institute study says half of the land slated for infill
4 development in our San Francisco bay region is located
5 in communities with highest outbreaks of toxic air
6 contaminants.

7 JOAN CHAPLICK: If you could complete your
8 remarks, please.

9 ANN SPAKE: Yes. The proposed plan will cause
10 an increase in traffic volumes and impair implementation
11 of emergency response and evacuation response. It will
12 increase greenhouse gas emissions. In conclusion, I
13 would comment that the absurdity of the plan is that it
14 is intended to address three major trends. Increased
15 group living by seniors, and increased
16 multi-generational households. This would not suggest
17 the type of land-use planning which you are doing. It
18 would suggest the opposite of dense structures with many
19 small single units.

20 I would ask that you reject the proposed
21 plan. It is poor. All the reasons you state in your
22 EIR is basically not feasible to mitigate. Okay.

23 JOAN CHAPLICK: Thank you for your comment.

24 Next we have Julie Leitzell. She will be
25 followed by Carol Sheerin and Sue Beittel.

D1-S1

1 JULIE LEITZELL: Hi, I'm Julie Leitzell, I
2 live in Larkspur. I apologize, I came in late. Are
3 there any board of supervisors people here?

4 JOAN CHAPLICK: We have the mayor of Novato --

5 JULIE LEITZELL: Well, I wish, I wish they
6 were hear. My problem is with the big picture and the
7 top down central planning. We will not have any control
8 over, I guess there are 14 sites in the county that are
9 going to be open for overdevelopment, rezoning. That
10 doesn't include all the various sites in all the cities.
11 And when people start seeing these developments going
12 up, they are going to have nobody to complain to,
13 because of the levels of bureaucracy that we have to get
14 through to get something stopped.

15 It's going to be too late at that point.
16 I have been over to the Pleasant Hill BART station where
17 a transit oriented villages, and if you all want to go
18 over there you will see that the whole bottom floor has
19 for lease signs in the retail. There's only a Starbucks
20 there that serves the office workers that comes across,
21 you know, a six lane road to get there. These are
22 developments that, generally, they are hard to fill.

23 I agree that the firefighters, the school
24 teachers do not want to live in developments like this.
25 I think it's ridiculous. I think that, that there have

1 been central planning fiascos in the past. Marincello
2 has been mentioned. Thirty thousand people were
3 supposed to be living in the Marin Headlands. And with
4 that project, 1959, the Army Corps of Engineers
5 projected that the Bay Area would have 14 million people
6 by the year 2020. They were obviously very off.

7 If you watched the PBS special on saving
8 the bay, what was the plan for all those people? We
9 were going to fill in a third of the bay. And we
10 started with Foster City. If you look at what they were
11 going to do, there was a large wide river that was going
12 to be flowing instead of the bay. So I, I urge every
13 elected official and everybody running for office, if
14 you are not opposed to this, this is going to be your
15 legacy. Thank you.

16 JOAN CHAPLICK: Thank you for your comments.

17 Our next speaker, we have Carol Sheerin.

18 CAROL SHEERIN: I'm Carol Sheerin, I live in
19 San Rafael. A few few weeks ago I read in the local
20 newspaper about the opening of the Devil's Slides
21 Tunnels, and I didn't think that I was going to be
22 affected by reading that article. The people in Devil's
23 Slide, the Caltrans wanted to build a four to six lane
24 highway going to the coast to avoid all those slides on
25 that highway. The people didn't want that. And it took

Page 40

1 them many years, they wanted a tunnel, and it was
2 dedicated two weeks ago.

3 And Anna Eshoo, who was a San Mateo
4 County Supervisor at the time, and is now a
5 congresswoman, spoke at the dedication to those tunnels,
6 and she said, what I, what I saw was democracy at work
7 and the people being heard. And what we need, is we
8 need to have the people being heard. Because we are not
9 being heard.

10 I would like to thank everybody who came
11 to this meeting today and those who spoke, because we
12 are trying to get our voices heard. And we, if we get
13 enough of us, we will not be ignored. I was in
14 Santa Barbara and Ojai over the weekend, and we have
15 friends who have property in Ojai, and I was shocked to
16 hear they are going through this very same thing.

17 Ojai is an agricultural community with
18 citrus groves, and they are fighting for -- they want
19 400 units of affordable housing there. This is going on
20 all over the state with nobody having any voice in the
21 cities and towns that we live in, and the counties. And
22 you are right, there should be supervisors here
23 listening to this. And that's what we need to do, we
24 need to get people to listen.

25 You look like you are listening, and I

1 hope you are hearing.

2 JOAN CHAPLICK: Thank you for your comments.

3 Next we have Sue Beittel, followed by Joy
4 Dahlgren.

D1-U1 5 SUE BEITTEL: My name is Sue Beittel, and I
6 live within almost walking distance of this hotel. I
7 live in an Eichler house that I bought for \$25,000 in
8 1961, where Terra Linda was a entry level community. I
9 am a strong believer in good collaborative planning.
10 Much of it has to occur at the local level, or it has to
11 be at least fine tuned at the local level.

12 In 1973 Marin County came up with a very
13 collaborative plan which divided the county into three
14 corridors. That we now enjoy very much. A urban
15 corridor, an agricultural corridor and open space
16 recreational corridor. We have added a fourth corridor
17 since then, so part of what those early good thingers
18 did is plan a future for Marin County, which we are now
19 trying to build on, so we will continue to have at least
20 a few entry level places for people who work in Marin
21 County.

22 I need to say, as somebody in the 85 plus
23 group of people, that there are many others like me who
24 live in this area. That those over 60 now comprise
25 about 25 percent of our population. And that number is

Page 42

1 going to go, during the course of this plan, to well
2 over 40, it's expected to go to 45 percent. And these
3 people will either age in place in their houses, move to
4 senior housing, or downsize into some of the affordable
5 units that we are talking about providing.

6 So I hope that you can continue to fine
7 tune this plan so that it meets the needs of the people
8 of Marin County.

9 JOAN CHAPLICK: Thank you for your comments.

10 Next we have Joy Dahlgren. I'll let you
11 pronounce your last name correctly.

12 JOY DAHLGREN: My name is Joy Dahlgren, and I
13 live in San Rafael in Lucas Valley. And I agree that
14 there's a need for affordable housing, but I don't agree
15 with what I see as being the way that this is intended
16 to be provided, which is in large projects. We all know
17 how this model has failed in many big cities. You get
18 too many people who are too poor all together. It's not
19 the right way to provide affordable housing.

20 I think it's much more sensible to
21 provide, rather than new buildings for low income
22 people, to provide rent subsidies for low income people.
23 There are a lot of ways to provide low cost housing.
24 One is sharing housing, and as people get older they
25 could also rent their rooms. Second units are another

Page 43

1 way.

2 I guess inclusionary development having
3 units disbursed in new developments, that's the way that
4 we should be providing affordable housing, rather than
5 large structures that -- and one that's being proposed
6 is very remote from transit. These are just not the way
7 to deal with that problem. And I think the problem
8 probably starts with the state legislation. And I would
9 like our elected officials at the local level and at the
10 regional level to start assessing that legislation and
11 seeing how it is dysfunctional in many ways.

12 It's much better to support low emission
13 vehicles than to try to build high rises in order to get
14 less driving, because it just doesn't happen that way.
15 Thank you.

16 JOAN CHAPLICK: Thank you for your comments.

17 Next we have Vincent Welch followed by
18 Brendan Burke.

19 VINCENT WELCH: My name is Vincent Welch, I've
20 lived in San Rafael since 1960. (Speaking Russian.)
21 During the Korean War I was a naval officer, Russian
22 language, working at the National Security Agency.
23 (Speaking Russian.) This meeting reminds me of a
24 government plan of the Soviet Union in operation. Top
25 down, no bottom up. This is not Brigadoon, it's a brig.

Page 44

1 Thank you.

2 JOAN CHAPLICK: Thank you for your comments,
3 sir.

4 Next we have Brendan Burke. And this is
5 the last speaker card I have, so if anyone wants to
6 speak, please fill out a card, otherwise this will be
7 our last speaker.

D1-X1 8 BRENDAN BURKE: Hello, my name is Brendan
9 Burke, and I'd like to follow up on that. Russia had a
10 five year plan, my old childhood, and they never had
11 enough grain grown. Plan never worked. That was the
12 top down approach. ABAG's approach in Marin County is
13 completely wrong. Their numbers are related to job
14 growth in this county, don't dovetail in any way, shape
15 or form with the Department of Finance, which is
16 supposed to be the gold standard for growth around here.

17 They don't show what ABAG projects. Your
18 projections are wrong. Your high density plan, we
19 support affordable housing in this county. We have for
20 years. But put a few units in with the current stuff.
21 Don't make them standalone. The ripple effect of high
22 density is horrible. The cost of infrastructure, the
23 schools, the tax base, the real estate values, the
24 environment all suffer under this high density plan.

D1-X2 25 The final thing are related to the

1 legislation is CEQA is not going to be undermined in
2 Sacramento as Jerry Brown has envisioned. CEQA is the
3 law. It involves local control and environmental
4 review. ABAG pushing 375, which is not the law, it is a
5 non compulsory guideline, should not be adopted in this
6 county. Our supervisors have drank the Kool-Aide. They
7 are going to ram this thing through, if they can. ABAG
8 is wrong. Our supervisors are wrong.

D1-X3

9 High density is wrong for the county. It
10 is out of character. I'm from Tam. Valley. Where is
11 the mitigation on our 42 mitigating circumstances?
12 There will be no mitigation. The homeowners will have
13 to pay for it. And we will pay for it with destroyed
14 quality of life, lower environmental situation, high
15 traffic. And we are going to have to pay -- the sewage
16 and the schools alone are, comprise more than the eleven
17 million dollars the supervisors are going to get in the
18 highway aid, but for doing, implementing ABAG's plan.

19 And ABAG sails along like its own ship,
20 doesn't hear any of this. You people need to go back to
21 the think tank and realize you have got the wrong plan,
22 and the wrong approach. We support affordable housing,
23 just come up with something where the people are
24 involved, where everybody can work something out we can
25 all live with.

1 JOAN CHAPLICK: Thank you for your comments.

2 Do we have any other speakers?

3 We do need you to fill out a speaker card
4 just so that we get the correct spelling of your name.

5 JIM BITTER: It's B-i-t-t-e-r. It's real
6 easy.

7 JOAN CHAPLICK: Okay. Please introduce
8 yourself and where you are from.

9 JIM BITTER: Jim Bitter from Mill Valley.
10 Mill Valley. And I see the clock is running over there,
11 we have two minutes.

12 JOAN CHAPLICK: She just started.

13 JIM BITTER: So the public needs to know that
14 the meter is running at MTC, where 11.5 million dollar
15 salary bureaucracy. We have this diet, and -- can you
16 pronounce that for me?

17 JOAN CHAPLICK: Dyett & Bhatia.

18 JIM BITTER: Do we know what they cost the
19 public to put this monstrosity together? We don't. I
20 couldn't find it. We have a group called ICF
21 International. 17 to 25 million dollars in federal
22 government to draft all this, you know what. It's in
23 the federal EPA, it's in the California EPA. It's a
24 carb. It's what's behind SB-375. It's what's behind
25 AB-32.

Page 47

1 So the meter is running. But it's -- you
2 guys are getting it right, because the visiting
3 sessions, you can't make a reservation, you couldn't get
4 in, because you got filled up real quick, but some
5 people came anyway. Judy Arnold and Susan Adams were
6 kind of annoyed that people were disruptive, and some
7 people actually came from the East Bay.

8 So I don't know where you came from, but
9 I live here. I was born here. This is a wonderful
10 place. I grew up across the street from the guy who
11 owned the dump. This Italian. He played golf. He went
12 to Marin Joe's with Adolf Delasatia. And he drove a
13 dry-cleaning truck. Somehow he got the dump. Now it's
14 Target, Home Depot. And I think he's in a rest home
15 now. He drove a dry-cleaning truck.

16 And somebody, this, I almost hit print on
17 this thing, but I went through it. And I planted trees
18 in land, because I work landscaping and construction.
19 They are out there now. In here it's telling us what
20 trees to plant, how far from somewhere, and has
21 something to do with the environment or something. It's
22 it's insulting to all of us.

23 This is a great place and we know how to
24 do it. Martin drove his dry-cleaning truck. In here it
25 says prohibiting trucks from idling for more than two

1 minutes. I, I, we know how to do that. We don't need
2 this bureaucracy. We don't need the federal government
3 telling us how to live our life. This is a great place
4 because of us, not -- you need to drive out 580, across
5 680 and look at the stuff they are building out there.

6 And we should put our supervisors on the
7 bus with all their belongings and make them, make them
8 go live out there, because we don't want that in Marin.
9 And you don't represent us, do you?

10 JOAN CHAPLICK: I'm the moderator.

11 JIM BITTER: You are the moderator. Great.

12 JOAN CHAPLICK: And if you could wrap up your
13 comments --

14 JIM BITTER: Let me say this, so whoever
15 represents us is conveniently not here today. Thank
16 you, supervisor. And they are going to vote for this
17 thing. It's a done deal. They appointed members of the
18 planning commission, they are going to vote for it. The
19 staff has swallowed all this indoctrination and school
20 that we need. Nobody, we can't explain, global warming,
21 climate change, greenhouse gases, you can't do it. Or
22 come up to the mic. and do it for me, because it's in
23 all the legislature. Thank you very much.

24 JOAN CHAPLICK: Thank you for your comments.

25 And I have a comment card from Barbara

1 Salzman. And then, are there any other any other
2 speakers?

3 If you could give your card to Ursula,
4 she will pass it over here.

5 BARBARA SALZMAN: My name is Barbara Salzman
6 and I'm representing Marin Audubon Society.

7 JOAN CHAPLICK: A little closer to the
8 microphone so you project.

D1-Z1 9 BARBARA SALZMAN: And I have, I'm sorry, I
10 missed your presentation. I have a few comments on the
11 EIR and will be submitting a letter. One of the
12 comments and concerns is that you seem to, well you
13 don't seem to, it's pretty clear that you consider that
14 there's little in the way of environmental resources
15 along the 101 corridor.

16 There's a repeated reference to the fact
17 that the more rural areas have more resource impacts. I
18 think that's a major flaw in the document, because our
19 101 corridor, our major corridor goes right by the tidal
20 wetlands and all the endangered species habitats. And
21 you also don't even mention endangered species, which
22 was sort of shocking, because our major endangered
23 species in the Bay Area, well we do have a few others,
24 but are connected to tidal marshes. And we have a
25 number of those, actually, right out here, (inaudible)

1 creek, Corte Madera.

D1-Z2

2 A third issue I wanted to mention is a
3 need for clarification about how your, how you're
4 considering the priority development areas. Because
5 there are certain ones identified in Marin County, they
6 are not real clear how, you it's not easy to find them
7 out, it would be very good if you would put them, list
8 them in the document.

D1-Z3

9 But, secondly, we have a major grant from
10 your agency, from ABAG, or MTC, one of them, went to
11 Larkspur for development, around the Larkspur ferry
12 terminal, and that isn't even a priority development
13 area. So it's not clear to me how you are considering
14 the impacts from those, from that kind of a project,
15 which is not even in a priority development area, how
16 that's being considered in the mix, because it seems to
17 me that your plan is developed around the priority
18 development areas.

19 And I hear a buzzer, but we'll be
20 submitting more comments.

21 JOAN CHAPLICK: Thank you for your comments.

22 Next we have Stephen Nestel?

23 STEPHEN NESTEL: Yes.

24 JOAN CHAPLICK: And then followed by Marjorie
25 Macris.

D1-AA1

1 STEPHEN NESTEL: Politics and power and money.
2 That's the answer. That's why we are dealing with all
3 of this. This actually is directed not to the EIR, but
4 to ABAG. You are riding on the juggernaut right now.
5 You have seen, you know that a lot of this data that you
6 are presenting is not scientifically valid. You also
7 know that you have been fudging the figures. You have
8 heard our arguments. And it's so frustrating coming to
9 these meetings and presenting clear logical arguments
10 and being ignored.

11 We are the people under the juggernaut.
12 And soon, as history shows, that the people in power
13 will be the ones falling in front of the juggernaut. I
14 just warn you to pay attention to the democratic
15 process. We believe in our democratic process.

16 JOAN CHAPLICK: Thank you for your comment.
17 Marjorie Macris. Okay. Just, don't rush, please, be
18 safe.

19 MARJORIE MACRIS: Sorry. My writing isn't too
20 good. It's Macris.

21 JOAN CHAPLICK: If you could just tilt the
22 microphone down so we can hear you.

D1-BB1

23 MARJORIE MACRIS: It's Macris, M-a-c-r-i-s.
24 And I'm speaking on my own, I'm not representing any
25 organizations. I think that the one critical comment

1 that I have, even though I think that the idea of having
2 a regional plan makes a lot of sense, and your idea of
3 concentrating development in locations that have transit
4 and other services is a very valid one, and it's
5 something that has been an established principle in
6 Marin County's plan, and for 40 years, but the one major
7 criticism I have of this document is that it does not
8 take into account the effects of sea level rise.

9 There is a very dismissive comment in the
10 plan itself saying, well, we know that the sea level is
11 going to rise but we are sure we will work it all out,
12 but it doesn't say how. And in the EIR there is a
13 description of how sea level rise is likely to effect
14 transportation lines but not Priority Development Areas.
15 And it's, I don't understand why the plan does not take
16 into account the projection of sea level rise to the end
17 of the century.

D1-BB2

18 BCDC has done that, and you just choose
19 the year 2040, which is the time horizon of the plan.
20 But if we know this is going to happen beyond that, it
21 seems to me that a good plan needs to take into account
22 what we know is going to have major impacts on any
23 development potential in Marin and around the rest of
24 the Bay Area. And then coupled with the repeated
25 emphasis on, we have to streamline CEQA, that is

1 particularly illogical due to the fact that the plan and
2 the EIR don't really show what the impacts, particularly
3 of sea level rise, as well as other impacts, are going
4 to be on these Priority Development Areas.

5 So it doesn't make a lot of sense to say
6 we have to expedite their development, when it's very
7 likely they are going to be under water in the
8 foreseeable future. Thank you.

9 JOAN CHAPLICK: Thank you for your comments.
10 I've gone through all of the speaker cards that I have.
11 The hearing is until noon, so we do want to accommodate
12 any late comers, anyone who comes. So if there is
13 anyone who hasn't spoken, and you would like to, please
14 fill out a speaker card. The MTC and ABAG staff and the
15 court reporters are going to be here until noon to
16 receive any additional comments that come through the
17 process.

18 Okay. We have some keys left at the
19 front table. So with that, we will have Brad from ABAG.

20 BRAD PAUL: A number of speakers asked why
21 there weren't members of the county board of supervisors
22 here, and several of them called me, because they are
23 meeting right now, their regularly scheduled meeting is,
24 unfortunately, at this time. So they wanted to be here.
25 I'm just, I'm telling you where they are.

1 JOAN CHAPLICK: We do have some additional
2 hearings coming up. Carolyn is going to review them for
3 us.

4 (Discussion had off the record.)

5 (Public hearing resumed.)

6 JOAN CHAPLICK: I have a speaker card here.
7 So I have L. Crocker.

8 LILIE CROCKER: That's correct.

9 JOAN CHAPLICK: And so if the court reporters
10 could take the comments. So after, after this last
11 comment we'll be closing the public hearing. If you
12 have additional questions or comments we will take them
13 in writing. Okay. So we have a final, a final comment
14 here that I have a speaker card for.

15 LILIE CROCKER: Yes, my name is Lilie Crocker,
16 I live at just at Marin Lagoon, bought the house in
17 2007. I'm a widow, have lived in San Rafael since 1966.

18 JOAN CHAPLICK: Okay.

19 LILIE CROCKER: I was told by my neighbor
20 that, when I had gone to City Hall, that there's no use
21 to come to these meetings. I went to the one with
22 supervisors in, in San Rafael. And we were many. Here
23 we have, and very knowledgeable people, but I was told
24 by this person that it's absolutely useless. We are
25 fighting City Hall, we are fighting Sacramento, we are

Page 55

D1-CC1

1 fighting Washington, D.C. And we are, limited
2 government is no longer the goal. It is growing
3 government.

4 And life has to be fair. And as my
5 husband told me once, he said, I, I said, that's not
6 fair. He said, Lilie, life is not fair. You have to,
7 it doesn't, if you want to make it fair, I don't know if
8 robbing Peter to pay Paul is exactly fair, but we are
9 growing government. And when you look at the map and
10 here at Embassy Suites, when you build the housing and
11 the station at the end of McInnis Parkway, unless I can
12 swim or walk in wetlands, I have no way to get out of my
13 neighborhood, which is family housing.

14 And very nice, and I bought it for my old
15 age to be safe, because that's a, you, you have to go --
16 you can get in but you got to go out the same way. And
17 also, we, it's already a lot of traffic. And, well,
18 since business, big business is leaving into homes
19 maybe, not so many workers coming into -- and anyway, I
20 just say, I will be shut off with the commuters that
21 support, and my property taxes go up, or my -- well, it
22 goes for everybody, I guess.

23 But I'm reminded that if you get
24 something for free, you don't really take care of it as
25 much as you have strived to work for yourself up, and

1 it's your money, you take better care of things. And I,
2 I think, I was reminded by the, by the gentleman that,
3 whatever happened to cruise ships, highrises? And
4 cruise ship was -- sure, a nice man, a Russian person,
5 but if you go to Moscow and you see this urban
6 landscape, whatever, these highrises are slum money, and
7 not, not many of them occupied. And is that what
8 you want to happen in Marin?

9 Besides --

10 JOAN CHAPLICK: Okay. That's it.

11 LILIE CROCKER: I know. I'm so frustrated
12 because I think that you are going to do, government is
13 going to do, and I have no recourse.

14 JOAN CHAPLICK: Okay. Thank you, thank you
15 for your comments.

16 I have a speaker card --

17 Sir, if you could --

18 (Interruption in proceedings.)

19 UNIDENTIFIED AUDIENCE MEMBER: This has to do
20 about a process question that you --

21 JOAN CHAPLICK: Sir, if you could --

22 UNIDENTIFIED AUDIENCE MEMBER: It's just real
23 simply, you said --

24 URSULA VOGLER: We have a process, sir.

25 JOAN CHAPLICK: I have my speaker card --

1 UNIDENTIFIED AUDIENCE MEMBER: Well, I just
2 want to know when the court reporter's comments will be
3 made available, to us, the public?

4 You are not going to make the recording
5 available, how about the comments? That's all.

6 JOAN CHAPLICK: Okay. So that is, that is a
7 question we will take into the process. I can't answer
8 it right now. I don't know, sir.

9 UNIDENTIFIED AUDIENCE MEMBER: You can't
10 answer a simple question like that?

11 JOAN CHAPLICK: Yes. Yes. So my next comment
12 is from Susan Wernick. I need Susan Wernick in the
13 front of the room. I'm taking comments from those who
14 have not commented, so if you have already spoken for
15 two minutes, you can make additional comments in
16 writing, but it is two minutes per person.

17 So for those of you who have already
18 spoken --

19 UNIDENTIFIED AUDIENCE MEMBER: This is the
20 juggernaut.

21 URSULA VOGLER: Just to answer your question,
22 sir, through the public record document request you can
23 make a public records request, we can send you those
24 transcripts. Okay. So through info@onebayarea.org you
25 can request --

1 UNIDENTIFIED AUDIENCE MEMBER: Sixty days,
2 ninety days after the period is done.

3 URSULA VOGLER: When we get the transcripts we
4 can send them to you.

5 UNIDENTIFIED AUDIENCE MEMBER: We, you know we
6 pay them.

7 URSULA VOGLER. Asked and answered. Thank
8 you.

9 JOAN CHAPLICK: Okay. Thank you, sir. So our
10 next speaker is Susan Wernick.

11 SUSAN WERNICK: I just have one quick comment.
12 I've lived in Marin my entire life. I work retail in
13 Novato. I speak to people daily about this project, and
14 there is very little awareness among the general public
15 about what is going on. I understand you have a
16 website. I'm someone who is linked into that. I get
17 The One Bay Area updates, but most people do not.

18 So, I, my question to you, or my
19 suggestion, perhaps, is that these meetings should be
20 printed not in an article buried in the newspaper but an
21 add that your organization's paid for and put out. They
22 are carefully printed, they are in all newspapers of the
23 Bay Area. We have so many people that are not clued in.
24 We have thousands of people in Marin County that still
25 do not know what the SMART train is, and yet the tracks

1 are already being laid.

2 So communication is really key. It is
3 extremely frustrating that a project like this, as vast
4 as this is moving forward, and the bulk of the
5 population is unaware of it. So I think you could do a
6 little better job by not telling people to go look for
7 the information. Put it out there. Put it in print.
8 We have got SMART train posters finally coming up along
9 the freeway. So people are becoming a little bit more
10 aware of it. What's that?

11 But that hasn't happened with this whole
12 project. And then clearly you put a lot of money into
13 it. I pay a lot of taxes, you could do it. So if we
14 could just get this into The Chronicle, the IJ, the
15 Press Democrat, all the newspapers, so people are aware
16 of these meetings, and so it might spark some interest.
17 Thank you.

18 JOAN CHAPLICK: Thank you for your comments.

19 Do I have anyone who hasn't spoken yet?
20 Any additional speaker cards?

21 Okay with that we are going to close the
22 public comment period.

23 (The Public Hearing concluded at 12:00 p.m.)

2 P R O C E E D I N G S

3 MS. JORDAN: Let's get started.

4 Good evening, everyone, and thank you all so
5 much for coming out tonight. My name is Jamillah
6 Jordan, and my planning firm MIG is working with ABAG
7 and MTC on these public hearings tonight.

8 We may get some more sound in a moment.

9 I'll be your moderator tonight, and I want to
10 thank all of you for coming out, taking the time, giving
11 your attention to this really important issue.

12 Our purpose today is to receive your comments
13 on the draft EIR. Tonight we have several members of
14 the project team responsible for the Plan and the EIR
15 documents here tonight listening. We also have two
16 court reporters who will be transcribing the comments
17 that we receive today.

18 So I want to go ahead and acknowledge the
19 elected officials who are in the room tonight. And
20 first up we have Mr. Mark Luce, who's an MTC
21 Commissioner and ABAG board chair and Napa County
22 Supervisor, Mr. Luce, over there.

23 We also have Mr. Robert Rayburn, a BART board
24 member, in the audience tonight. Wonderful.

25 We also have Mr. Pedro Gonzalez, who is the

Page 4

1 mayor of the City of South San Francisco.

2 Thank you all for coming out tonight. We
3 appreciate that.

4 So our agenda for the meeting is as follows:

5 There will be a short presentation by Carolyn
6 Clevenger, MTC planner, on the draft EIR. And her
7 presentation will provide an overview of the EIR and the
8 general process.

9 Following the presentation, we'll go ahead and
10 start the public comment period. If you'd like to
11 speak, we ask that you please fill out a blue card with
12 your name and where you are from. We see an example of
13 that. I have one up here as well that I want to show
14 all of you.

15 Each speaker will have two minutes to provide
16 their comments. We will have a timekeeper to help
17 ensure that everyone sticks to that two-minute time
18 frame and everyone gets the same amount of time. Once
19 you hear the buzzer go off, it means that your time is
20 up and we ask that you wrap up your comments.

21 A court reporter will provide MTC with a full
22 transcription of the comments, and the court reporters
23 are located right over there (indicating), as you see
24 them. So please go ahead turn in your comment card form
25 if you haven't already done that.

1 I will read the names of each commenter in
2 groups of three. We ask that you please line up and be
3 ready to comment. Please state your name for the record
4 and the city where you live. We ask that you please
5 speak slowly so that the court reporters can get all of
6 your information down.

7 Once you reach the two-minute mark, you'll
8 need to close your comments, and I will call up the next
9 speaker. If two minutes is not sufficient, you can
10 provide additional comments in writing, and these forms
11 are available at the welcome table. I think all of you
12 got one on your way in.

13 Okay. For those of you who do not wish to
14 speak, you're encouraged to fill out a comment card and
15 turn it in at the end of the meeting. You can also
16 submit comments in writing via fax, mail or e-mail. The
17 deadline for comments is May 16 at 4:00 p.m.

18 I want each of you to know that all of your
19 comments, whether they're received verbally at today's
20 hearing, through a comment card or sent in writing by
21 fax, e-mail or mail that I mentioned, they'll be handled
22 the same way and responded to in the final EIR.

23 And finally on a housekeeping note, I just
24 want to mention that the restrooms are located towards
25 the entrance. The women's is on my left and your right.

1 And the men's is located on my right.

2 So with that, I want to go ahead and now open
3 up the hearing and introduce Carolyn Clevenger from MTC
4 who will provide a brief presentation on the EIR.

5 Carolyn?

6 MS. CLEVENGER: Good evening. Hopefully these
7 microphones should work.

8 My name is Carolyn Clevenger. I work in the
9 MTC planning section. I'm the project manager of the
10 draft EIR that we'll be talking about this evening.
11 Sitting next to me is Mark Shorett with Association of
12 Bay Area Governments, which is our co-lead agency on
13 this document.

14 The purpose of this public hearing is to
15 present an overview of the plan and the EIR, as well as
16 to receive public comments on the Draft EIR. Responses
17 to all comments and questions will be provided in
18 writing in the final Environmental Impact Report.

19 I'd like to note that the focus of this
20 meeting is on the EIR; it's not on the Plan document
21 itself. So we ask that you focus your comments on the
22 EIR. And for comments related to the Plan, you can send
23 your comments to info@onebayarea.org, or you can also
24 attend one of the Plan open houses and public comment
25 hearings that are being held throughout the region, and

Page 7

1 there's a brochure at the table where you came in
2 identifying the opportunities to comment on the Plan at
3 those public hearings.

4 The purpose of the EIR is to analyze and
5 disclose the potential environmental impacts of the
6 implementation of the proposed Plan. It is meant to
7 inform decision-makers, responsible agencies and the
8 public of the range of environmental impacts of the
9 proposed Plan. It also recommends measure to mitigate
10 any significant impacts that are identified, and it also
11 evaluates a range of alternatives to the Plan, which
12 I'll go into in greater detail.

13 Just as some background to help provide some
14 context, the Plan is a regional task. It's the first
15 time we've done and integrated land use and
16 transportation plan. It's required by Senate Bill 375,
17 and it requires an integrated land use and
18 transportation plan, which hits two specific objectives
19 of reducing greenhouse gas emissions by 15 percent by
20 2035 and also houses the region's population at all
21 income levels.

22 The Plan embodies local visions, in that it
23 works with local jurisdictions to identify areas for
24 growth; priority development areas. And it seeks to
25 increase economic competitiveness while also preserving

1 the natural environment of the nine-county region.

2 The Plan looks from 2010 to 2040 and
3 identifies projected jobs and population growth in that
4 time period, and this table summarizes the projected
5 approximately 1 million additional jobs that the region
6 will need to accommodate in that period and
7 approximately 2 million additional people. The EIR
8 evaluates the environmental impact associated with
9 accommodating this growth; it doesn't evaluate the
10 projection itself.

11 This map shows most of the focused growth in
12 the Plan -- is allocated to PDAs, priority development
13 areas. They account for less than 5 percent of the
14 region's land, but in the proposed Plan they can
15 accommodate approximately 80 percent of new homes and
16 over 60 percent of new jobs. Approximately 40 percent
17 of the new jobs and housing are projected to be in the
18 region's three largest cities; San Francisco, Oakland
19 and San Jose. And approximately 75 percent of the
20 growth is located in the four central counties; Alameda,
21 Santa Clara, San Mateo and San Francisco.

22 Get to the transportation side. On the
23 transportation side, the Plan -- the total revenues
24 forecasted over the 28-year plan period of \$289 billion,
25 just over half, 53 percent, is local fund sources. It's

1 primarily sales taxes raised at the county level. The
2 nine counties in the Bay Area have local sales taxes.
3 There's -- approximately 15 percent of the funds are
4 regional, as primarily bridge tolls. And then the state
5 and federal funds kind of round out the revenue sources
6 for the Plan.

7 Approximately 80 percent of these funds are
8 committed funds, so those are projects that are either
9 funded 100 percent locally or are through a certain
10 point of project development when the Plan was begun.
11 And those projects were deemed to be committed and not
12 part of the regional decision-making process of the
13 Plan.

14 In terms of how the funds are expended,
15 88 percent of the proposed Plan funds are dedicated to
16 operating and maintaining the existing roadway and
17 transit system. The remaining 12 percent is split
18 roughly evenly between road and bridge expansion at
19 5 percent and transit expansion at 7 percent.

20 Turning to the Environmental Impact Report.
21 It evaluates the impact of the proposed Plan on 14
22 environmental issue areas: Transportation, air quality,
23 land use, energy, climate change and greenhouse gases,
24 noise, geology and seismicity, water, biological, visual
25 and cultural resources, public utilities, hazards and

1 public services and recreation.

2 The Draft Environmental Impact Report also
3 identifies potential mitigations for each area where
4 it's deemed to have a potential impact. Those
5 mitigations would be implemented as appropriate at the
6 local level, as local jurisdictions and project sponsors
7 move forward with projects.

8 Since ABAG and MTC cannot ensure
9 implementation of mitigation measures, those areas that
10 are shown here in bold are still in the Environmental
11 Impact Report deemed to have potential but significant
12 impacts.

13 I mentioned earlier that the EIR evaluates
14 alternatives. This highlights the different
15 alternatives to the proposed Plan that are evaluated.
16 California Environmental Quality Act requires that you
17 include the "No Project" as one of the alternatives in
18 the Plan.

19 The "No Project" takes the existing 2010 land
20 uses and transportation network. It also includes those
21 projects that I mentioned earlier that were committed.
22 So projects that were 100 percent locally funded or far
23 enough along in their project development.

24 The "Transit Priority Focus," which was called
25 Alternative No. 3 in the EIR, includes higher densities

1 near high quality transit, also includes a higher peak
2 period Bay Bridge toll, which is used to fund additional
3 BART and AC Transit investments.

4 The "Enhanced Network of Communities," which
5 is called Alternative 4 in the EIR, is based on input
6 from business stakeholders. They opted to use a higher
7 population total for that alternative. So forecasted a
8 higher level of population and job growth in the region,
9 and also included a more dispersed growth pattern. On
10 the transportation side, that alternative included a
11 higher period of bridge tolls, but those revenues in
12 that alternative are used to fund additional maintenance
13 of the state highway system.

14 And the last alternative, "Environment, Equity
15 and Jobs," which is called Alternative 5, was developed
16 based on input from the equity and environmental
17 stakeholders. On the land use side, it emphasizes
18 increasing opportunities for low-income housing in
19 job-rich communities.

20 It also is -- it eliminated uncommitted
21 roadway expansion projects in that alternative,
22 including the express lane network was eliminated in
23 that alternative. And it charged a VMT tax that was
24 used to fund additional transit investments in the
25 region.

1 In terms of how the alternatives performed in
2 the Environmental Impact Report, all of the
3 alternatives, including proposed Plan, have similar
4 impacts. Alternative 5 is identified in the EIR as the
5 "environmentally superior alternative." It had the
6 greatest reductions of GHG emissions, greenhouse gas
7 emissions. It also had fewer emissions for toxic air
8 contaminants and particulate matter emissions as
9 compared to the other alternatives.

10 However, the proposed Plan did have the
11 benefits over Alternative 5, it had the lowest vehicle
12 miles traveled or VMT per capita. It also had lower
13 congested VMT than Alternative 5, so fewer miles were
14 traveled in congested conditions. It included less
15 agriculture and open space conversion.

16 Alternative 3, the transit priority focus had
17 the least environmental impact on the transportation
18 side, as a future shorter commute, travel times, lesser
19 amount of congested VMT, and a lesser potential for
20 transited crowding.

21 As Jamillah outlined, there's multiple ways to
22 comment on the Draft EIR. You can comment orally at
23 today's meeting. You can submit your comments in
24 writing, either at today's meeting or mail, fax or
25 e-mail to my attention by 4:00 p.m. on May 16th.

1 And I just want to note again that comments on
2 the Plan should be made separately to
3 info@onebayarea.org or at any of the public hearings
4 being held on the Plan throughout the nine counties.

5 In terms of schedule, the comments period
6 closes on May 16th. We will be presenting the comments
7 in responses to comments to the MTC commission and the
8 ABAG board. Those are the two bodies that will vote on
9 adopting the Environmental Impact Report as well as the
10 Plan, and we anticipate a final adoption of the EIR in
11 July of this year.

12 So with that, I'll turn it go back to
13 Jamillah.

14 MS. JORDAN: Great. Thanks so much.

15 Okay. Is that better, everyone?

16 THE PUBLIC: Yes.

17 MS. JORDAN: Sorry about that mishap there.

18 So now we will open the comment -- open up the
19 hearing here for the public comment. And I want to
20 mention that along with your comments, any questions
21 that you may have will be included and responded to in
22 the final EIR. Okay? So let's go ahead and get the
23 process started. I'm going to call up the first three
24 speakers, and we ask that you form a line there in the
25 middle and speak when I call your name.

1 The first one is Charlie Cameron, followed by
2 Myesha Williams, followed by Devilla Ervin.

3 Mr. Cameron?

4 CHARLIE CAMERON: Yes. Good evening. The
5 name is Charlie Cameron. I'm a Hayward resident, but I
6 consider myself now a resident of Union City.

D2-A1 7 First of all, only three things that I want
8 you to note. Being that the current Union City west
9 side is now completed, I do think it is not going to be
10 able to perform up to expectations. The design is
11 pretty much bad. It's piss poor bad, the way the buses
12 come in and the location for other things to include the
13 taxis and pickup area and the kiss and ride. I'll be
14 sending in corrections for the San Jose Diridon Station.
15 The signs. I was in crisis one time, and I realized the
16 signage was screwed up and could be better.

17 I'm going to be sending in correction --
18 correctly corrections with the correct spelling of the
19 word "Capitol Corridor." It's misspelled in the
20 document.

21 And I want to thank you, Moderator, for
22 bringing to our attention now the deadline for comments
23 is May the 16th. We didn't know that, and I didn't know
24 that. Thank you for bringing that attention.

25 Bye.

1 MS. JORDAN: Thank you, sir.

2 MYESHA WILLIAMS: Hello. My name is Myesha
3 Williams for the New Voices Are Rising Project.

4 In New Voices Are Rising, we work with high
5 school students to help them gain skills and experiences
6 on behalf of themselves and their communities.

7 I want to thank you for this opportunity to
8 comment on the EIR. I would like to state my support
9 for Alternative 5. And even though the Draft EIR
10 identifies this alternative as "environmentally
11 superior," we believe that the Draft EIR does not
12 adequately analyze the VMT and greenhouse gas reduction
13 that this alternative would offer as compared with the
14 proposed Plan.

15 The EEJ alternative funds significant
16 investment for frequency improvement for high-demand
17 systems like AC transit, which many people in the
18 community that we work with depend on for daily access,
19 opportunities and necessities. According to the Bus
20 Access Health Impact Assessment conducted by the Alameda
21 County Public Health Department, more investment and
22 transit service, especially bus service, can improve
23 health and vitality for riders, their communities and
24 the transit system overall.

25 Currently, youth, seniors and

1 transit-dependent people's health is suffering as a
2 result of disinvestment in transportation. The HIA
3 found that reduction in bus service negatively affected
4 the physical, mental health, safety and well-being of
5 the most vulnerable rider.

6 In order to reduce VMT, we must restore local
7 transit to a reasonable baseline of service by
8 committing an additional 70 million per year to
9 restore bus service cuts made over the past five years.

10 The EEJ alternative favors the best reducing
11 VMT miles traveled, which in turn helps us to reach our
12 goals of reducing greenhouse gas emissions. As the
13 alternative with the strongest ridership, EEJ will
14 ensure that public transportation remains accessible,
15 affordable and will help to improve health and reduce
16 health disparities.

17 Alternative 5 prioritizes bus, BART and plans
18 for a free youth bus pass program. This proposal was
19 especially significant for those of us who work with
20 youth who experience negative health impacts and
21 critical barriers to opportunity, due to rising transit
22 costs, service cuts and route changes.

23 MS. JORDAN: Thank you. Thank you very much.

24 DEVILLA ERVIN: Thank you.

25 Hello. My name is Devilla Ervin, and I've

1 been working with the New Voices Are Rising Project for
2 a more sustainable and resilient Oakland since I was 14.
3 I'm now 23.

D2-C1

4 As a young man looking to live on my own, I am
5 deeply trouble by the threat of displacement in my
6 community and other areas slated as priority development
7 areas. But underestimating the impact of displacement,
8 I feel we are doing a disservice to the entire purpose
9 of Plan Bay Area. This placement needs to be at the
10 forefront of this conversation, not swept under the
11 table. You cannot cut VMT and/or greenhouse gases, gas
12 emissions without dealing with this threat.

13 Living in Oakland, I know many people who find
14 themselves being forced to leave their homes and
15 community that hold extensive history to find housing
16 that is less expensive. One example of this is my
17 foster mother. In my junior year of high school, she
18 found a place that was affordable, but it was in
19 Sacramento. She was still working in Hayward commuting
20 five hours a day to and from work.

21 This is what I fear for thousands of other low
22 income families with the adoption of this proposed plan
23 in the absence of additional mitigation. Without
24 careful, conscious, deliberate planning, more low income
25 residents will be pushed out to less attractive and more

1 polluted parts of the region, while new transit-oriented
2 developments attract new residents who have not
3 historically found neighborhoods like West Oakland
4 attractive.

5 Plan Bay Area should not add to the list of
6 issues residents of West Oakland or similar
7 neighborhoods have to deal with.

8 By increasing investment in public
9 transportation, affordable housing and strategies to
10 retain and build businesses that serve the existing
11 community, Alternative 5 will go a long way towards
12 addressing these concerns and mitigating the impacts of
13 displacement pressure.

14 Plan Bay Area should be providing solutions
15 and incorporating the strategies in Alternative 5 that
16 make it the environmentally superior alternative,
17 leading to a more truly sustainable and resilient
18 Bay Area.

19 Thanks for your time.

20 MS. JORDAN: Thank you for your comments, sir.

21 I'm going to call up the next three speakers.
22 First will be Brenda Barrón. Next will be Pamela Tapia,
23 followed by Woody Little.

24 Please come to the center of the aisle.

25 BRENDA BARRÓN: My name the Brenda Barrón, and

1 I'm currently a freshman at San Francisco State
2 University. I was born and raised in Oakland,
3 California, and I lived my whole life here.

4 I have seen many problems in the community,
5 and I have been to different meetings and spoken about
6 what can we change. One of the problems that concerns
7 me most is public transportation because I take it
8 almost every day to school.

D2-D1

9 Speaking today -- tonight was Plan Bay Area
10 and the EIR do not do a good enough job of addressing
11 the impact of adding more rides to the transit system.
12 Without the level increasing transit investment that
13 includes in the environment equity and job alternatives,
14 adding more rides to the public transit system without
15 enough adding investment will have serious impact for
16 youth and other low income riders.

17 I have been taking public transportation since
18 I was five years old when I started riding the bus to my
19 mom's work, and I never thought transportation was a big
20 deal until I grew up, but it has changed a lot since I
21 was five. Bus stops have been moved far from my house.
22 There are fewer buses, and I have to wait longer most of
23 the time. Night services have been reduced. The bus I
24 take that -- takes off 10:00 p.m.

25 When I was five, I was too small to understand

1 what was going on. But as I grew up, I've seen and
2 heard what people say about transportation in their
3 community.

4 In the last few years, bus lines have been
5 changed and cut so that people get confused about which
6 line goes to which places. The people do not want to
7 see bus services cut; they want to see more bus routes
8 and more frequent buses. Many people take the bus
9 because they cost less than the BART -- than BART. The
10 BART takes you back and goes farther.

11 MS. JORDAN: Please wrap up your comments.

12 BRENDA BARRÓN: There are other problems with
13 ground service levels. BART does not have enough
14 transit so that people can sit down. Thank you.

15 MS. JORDAN: Thank you.

16 PAMELA TAPIA: Good evening. My name is
17 Pamela Tapia. I'm a student at Peralta Colleges. Thank
18 you for the opportunity to speak to you tonight.

19 The EIR Draft consideration of displacement is
20 inadequate. The EIR fails to factor in the impact of
21 gentrification on housing costs in neighborhoods that
22 historically have been home to low income residents.

23 The assumption that low income residents will
24 avoid moving farther away from their jobs and their
25 homes and neighborhoods despite these areas becoming

Page 21

D2-E1

1 more attractive to other residents. Without significant
2 addition investment in affordable housing and other
3 anti-displacement policies, displacement will occur.

4 In September 2011, my mother lost her minimum
5 wage job. Her factory decided to pack up and move to
6 South Carolina. She was out of a job. As a single
7 parent raising two kids, my mom depended on the \$280 she
8 received every week to pay the \$700 rent. She spent
9 most of her check on housing and transportation. She
10 decided to move to central valley to a city called
11 Manteca. An apartment was half the price as our former
12 home, but there are no jobs in the central valley. She
13 had no option; she had to go back to what she was doing
14 before.

15 After months of desperate job hunting, my
16 mother found a job in a factory in Union City's
17 Industrial Park. My mom now lives in Manteca but has to
18 commute to Union City for work. What used to be a
19 30-minute drive now become a four-hour commute. She
20 doesn't have a car. She has to take the bus from
21 Manteca to Stockton, from Stockton take a train to
22 Richmond, from Richmond take BART to Union City, and
23 from Union City take another bus.

24 She now has to pay over \$60 a week (verbatim)
25 just to travel to work. She works eight hours at an

1 8-hour dollar rate turns out to 64. So she spends \$60 a
2 day and she gets \$64 a day also, she's only getting \$4.
3 She knows she cannot work. She literally cannot afford
4 to work.

5 So when spending so much money traveling, she
6 determined she had to stop traveling. She often slept
7 on BART, traveling the trains from one end to the other
8 end, hoping to just catch another day.

9 MS. JORDAN: Please wrap up your comments.

10 PAMELA TAPIA: I feel awkward writing this and
11 even reading it to you, but I do not look for pity.
12 This was not my goal. My goal was to inform you that
13 this happens. The EIR assumes that displacement will
14 not result in increased rates in commuting from outside
15 Bay Area and cross commuting from -- between counties.
16 This assumption is not supported by historical transit,
17 and it's not supported by my experience.

18 Thank you.

19 WOODY LITTLE: Hello and good evening. My
20 name is Woody Little, and I'm a first-year student at
21 UC Berkeley but an Oakland native. I want to talk
22 tonight a little bit about displacement, as some of the
23 other commenters have echoed.

24 The Plan Bay Area document states that the
25 Plan will place 36 percent of communities of concern to

1 risk of displacement, while the EEJ alternative,
2 Alternative 5 -- in this plan, 21 percent face
3 displacement risk, and that's already with the
4 assumption that are perhaps flawed because they rely on
5 this model that does not take into account
6 gentrification pressures.

D2-F2

7 Now, this has two main effects. One effect is
8 on the environment. We believe that because the Draft
9 EIR does not take into account gentrification pressures,
10 that the extent to which the EEJ alternative outperforms
11 the proposed Plan, the GHG emission reductions is
12 underestimated. So in fact, already -- though,
13 Alternative 5 is already the environmentally superior
14 alternative, it is likely far more superior than is
15 currently estimated.

D2-F3

16 Additionally, and perhaps more importantly,
17 these displacement pressures place social economic
18 pressures on low income communities and communities of
19 risk. I grew up with extreme privilege in Rockridge in
20 an affluent community in Oakland. However, I try to put
21 myself in the position of someone who would be displaced
22 by gentrification.

23 I imagine that if I was in high school and my
24 family had to start paying significantly more income
25 because stores in the area were now catering to other

1 residents instead of us who had been living there a long
2 time, I wonder what our family would have been able to
3 afford in terms of other services for me to do outside
4 of school, extracurricular activities that enriched my
5 life and made it possible for me to attend UC Berkeley.

6 Additionally, I wonder what would have
7 happened if I had been displaced and had to restart my
8 life all over again in the middle of high school or in
9 the middle of elementary school, an even more
10 informative time in my life. I think that would have
11 been a significant obstacle to get into UC Berkeley and
12 to -- you know, the struggles that I now have in trying
13 to further my own education. I think that would have
14 been much more difficult under this Plan. So I hope
15 that you take those facts into consideration.

16 Thank you.

17 MS. JORDAN: Thank you, sir.

18 I'm going to call up the next three speakers.
19 First we have the Teadora Taddeo, Signe Mattson, and
20 Kasey Saeturn.

21 TEADORA TADDEO: Hello. Good evening. I'm
22 Teadora Taddeo, and I'm also a UC Berkeley student.

23 I take great pride in being a part of a
24 cutting-edge and progressive region. I want to look
25 back in 20 years and find that my community was on the

1 right side of history.

2 Our regional plan, as a step towards
3 sustainability, should promote safety and longevity for
4 all people. A plan that neglects low income and
5 under-resourced individuals is absolutely unacceptable
6 in my eyes.

D2-G1

7 I believe the environment equity and job
8 alternative can serve our community more fairly.
9 Affordable, updated housing, quality transportation and
10 increased security for residents susceptible to extreme
11 weather. These are the provisions that simply must be
12 made in any plan to be adopted in the Bay Area in 2013.

13 We need a plan that will carry us into the
14 future, taking into account serious environmental
15 concerns, as well as equity and justice for all Bay Area
16 residents.

17 I support Alternative 5, and I strongly
18 encourage you to consider it as well.

19 Thank you so much for your time.

20 MS. JORDAN: Thank you.

21 Next speaker.

22 SIGNE MATTSON: Good evening. Signe Mattson,
23 resident of Albany.

D2-H1

24 A few concerns: At this point, first of all,
25 the amount of public notice, it claims in the report and

1 in the EIR, that you outreached so many times in so many
2 places, but I only heard about this by accident about
3 maybe two weeks ago now. So that's the first thing. If
4 you seriously want some public input, you've got to let
5 people know.

D2-H2

6 Secondly, this is touted as a strategy for a
7 sustainable region, but yet I have to find no mention of
8 the question of food security, equitable production and
9 distribution of food. This is -- I don't know how you
10 can talk about sustainability, and you don't even mention
11 the question of food.

D2-H3

12 Another concern I have is about the CEQA
13 streamlining, and overriding of CEQA. Many of us are of
14 the opinion that the CEQA requirements are already very
15 weak, and yet you propose to weaken them further, and
16 yet you're talking about improving the environment.

D2-H4

17 So I don't know how you lower environmental
18 standards and then -- to improve the environment. If
19 you're going to concentrate a bunch of people living in
20 apartments along high transit travel areas that produce
21 all these greenhouse gas emissions, one of your
22 mitigations is going to be air filtering. So does this
23 mean that you'll have windows that don't open and air
24 condition on 24/7, except for when the power goes out
25 and the air conditioning can't work?

Page 27

1 MS. JORDAN: Please wrap up your comments,
2 ma'am.

3 SIGNE MATTSON: Okay. Sea level rise and
4 tidal surges, and yet you want to concentrate the
5 population at the shoreline? Doesn't make a lot of
6 sense to me, and I ditto the comments about the
7 preferred alternative. Thank you.

8 MS. JORDAN: Thank you.

9 KASEY SAETURN: Hi. My name is Kasey Saeturn.
10 I'm a senior at Oakland High School.

11 So I just wanted to say that I would like to
12 see more eco-friendly buses, because so far I've only
13 seen, like, a couple hydrogen fuel cell buses, and
14 that's only on one bus route. So this bus route runs
15 along my school, actually. It's the 18 bus, and I've
16 only seen it a couple times, and I just think it'd be
17 nice to see more eco-friendly buses.

18 Also on another note, I'm a student. So after
19 school or, like, before school, I take the bus to school
20 and to work and stuff like that. But the fact is, in
21 the morning, it's really difficult to actually get on
22 the first bus and be on time for school sometimes
23 because it's just so packed. Because it's so packed,
24 I'm either late to school and work, and it just doesn't
25 exactly work out for me.

1 So -- and another -- like, I also have to
2 actually stand at the bus stops because there are no
3 benches where I'm -- where the bus stops I'm at, so it's
4 kind of difficult to actually sit down and get
5 comfortable in the morning or after work, even. So it's
6 just really hard for me.

7 Thank you.

8 MS. JORDAN: Thank you. I'm going to call up
9 the next three speakers now.

10 First we'll have Jill Ratner, followed by
11 Evelyn Stivers, and Peter Singleton.

12 JILL RATNER: Hello. My name is Jill Ratner.
13 I'm an Oakland resident, and I also work with New Voices
14 Are Rising, and I want to echo the comments of the
15 students who are very concerned about public transit and
16 about affordability and particularly about affordability
17 of housing and displacement.

18 One of the issues that I was concerned about
19 in reading the EIR was that it seemed to assume that the
20 significant -- that there will not be significant
21 impacts to the quality of trip experience for the bus
22 riders, adding more riders without a significant -- the
23 most significant possible increase in investment in bus
24 service.

25 There's an assumption that the buses are not

1 overburdened unless there's an 80 percent threshold in
2 terms of available seats systemwide that's crossed, and
3 I think what the students have said is that both buses
4 and BART are overburdened now and would be even more
5 overburdened under the proposed Plan.

D2-J2

6 We believe that the -- Alternative 5 offers
7 significant mitigations that need to be more carefully
8 assessed in the final Environmental Impact Report, and
9 that particularly some of the assumptions, including the
10 assumptions about cross-commuting, end-commuting and the
11 transportation impacts of additional ridership without
12 the highest level of investment need to be reassessed.

13 Thank you.

14 MS. JORDAN: Thank you.

15 EVELYN STIVERS: Hi. Thank you.

16 What a tremendous amount of work that
17 obviously went into the EIR, and I really appreciate
18 staff's hard work on that.

19 My name is Evelyn Stivers. I work with the
20 Nonprofit Housing Association. I also live here in
21 Oakland, and we will be submitting comments in writing,
22 but I did want to bring up an important thing that I
23 think is overlooked in general in the Draft EIR, looking
24 it over. That is sort of the underrepresenting how
25 important increasing transit investment is on land use

D2-K1

1 and how that can have a greater reduction in GHG
2 emissions than is acknowledged in the Plan.

3 Right now, the biggest limiting factor to
4 affordable housing production in the region is money.
5 Increasing bus and -- especially bus service, but local
6 transit service, can make more properties competitive
7 for tax credits. It can increase the amount of money
8 that the state and the -- this region gets in an
9 investment and can make more properties viable for
10 affordable housing.

11 So I think that's an important consideration,
12 especially given the current climate and the huge
13 disparity we have between the regional transportation
14 plan, which is a funding allocation plan and the housing
15 plan, which is very well-intentioned but not funded.

16 Thank you.

17 MS. JORDAN: Thank you.

18 PETER SINGLETON: Peter Singleton.

19 I'm going to submit my comments on the Draft
20 EIR in writing once I've had a chance to look over the
21 document. As you probably gathered, it's a very large
22 document.

23 But what I wanted to do was I wanted to thank
24 the young people for coming, and I don't personally
25 support Alternative 5, but I think the students that are

1 here are raising a couple of really important points
2 that I hope that you folks considered.

D2-L1

3 One is displacement. And I think all of the
4 alternatives have displacement risk that is significant
5 and should be looked at. And that's a big concern. And
6 these kids are right, what they're talking about.

D2-L2

7 The other is the importance of bus service.
8 And the Plan is very heavy on rail and light rail and
9 other kinds of what you call transit investments, but
10 bus service is often the -- adding buses to heavily
11 utilized routes and also dropping fares can be the very
12 best way to serve lower income communities that our
13 buses are so important to.

14 And I would just urge you to listen to these
15 young people, and, again, I -- thank you guys for
16 coming, I really appreciate it.

17 MS. JORDAN: Thank you, sir.

18 We have one card remaining. I'm going to call
19 up that individual, unless -- if you have a blue comment
20 card, please hand it to our ushers here on the left and
21 right. Now is the time to do that.

22 So I'm going to call up the next two speakers.
23 That's Peter Singleton -- oh, I'm sorry. Peter already
24 spoke.

25 And this individual. Pardon if I butcher your

1 name. Decline Lastot (verbatim)?

2 PUBLIC SPEAKER: Decline to state.

3 MS. JORDAN: And then the gentleman as well,
4 if you wouldn't mind --

5 PUBLIC SPEAKER: I note that the EIR includes
6 \$14 billion -- I note that the EIR includes \$14 billion
7 in nebulous, quote, "anticipated unspecified," unquote
8 federal dollars. The Plan relies on the use of these
9 dollars. The EIR is entirely flawed because this
10 reliance accounts for fully 5 percent of the money
11 figured into projects that affect the environment.

12 I also note that the population figures that
13 are forecasted are entirely created by the staff.
14 California statutory law has deemed the California
15 Department of Finance as the proper authority to create
16 population figures used by the Government in California.

17 Also, I was moved by the students' talk this
18 evening about displacement, and it reminded me of the
19 urban redevelopment that took place in the Bay Area in
20 the 1960s to very, very bad effects. And the historical
21 analysis was not included in the EIR.

22 MS. JORDAN: Thank you.

23 Sir?

24 JIM BITTER: I'll just be a second. So my
25 name is Jim Bitter, and we came up from Mill Valley, and

1 we generated a lot of greenhouse getting here. So
2 thanks for holding this, and I want to thank the kids
3 for coming tonight, except that -- or I just heard
4 \$14 billion and the cost of MTC and the cost of the
5 consultants and the cost of the consultants to put
6 together the EIR report and other consultants that are
7 involved in the EPA, federal, state, CARB -- what did I
8 leave out? California Energy Commission. It's all the
9 same language. It's all the same industry that's
10 pushing this thing. And that the kids in the gallery
11 here are going to end up paying for this because the
12 State of California is in the hole about \$80 billion,
13 and the federal government is approaching 17 trillion.
14 There's no way we can pay it back.

15 I came from a little town up in Marin, and
16 there's probably lots of stories like this where we had
17 a city council, we had a planning commission, we had a
18 little white church, we had steam locomotives, we had
19 dairy farms. It was all our stuff. The federal
20 government didn't tell us what our town was going to
21 look like. That was the old United States of America.

22 So I'm telling the kids, get ready because
23 you're going to find out that people other than yourself
24 are going to be telling you about transportation,
25 housing, the kind of housing you have. And a lot of

1 other things that are coming.

2 So anyway, thank you very much.

3 MS. JORDAN: Thank you, sir.

4 The next speaker I'm going to call up is
5 Mr. Azibuike Akaba.

6 AZIBUIKE AKABA: Good evening. My name is
7 Azibuike Akaba. I'm with the Public Health Institute in
8 the regional asthma management and prevention project.
9 So we're primarily focused on looking at air quality and
10 protecting low income communities and communities of
11 color that would be impacted by displacement.

12 As the young people stated, which I'm really
13 proud to see so many young people come out and speak
14 this evening and so articulately, I think that the issue
15 of suburbanization of poverty, which isn't really
16 highlighted very well in the EIR overall, is that low
17 income people are going to be impacted, and there needs
18 to be some type of strategy and/or mitigations to
19 address that suburbanization of poverty.

20 And I also think that -- some good things that
21 I saw in the EIR is the assessment of air quality and
22 the inclusion of diesel, which we're going to -- you
23 know, is a project of ditching dirty diesel. I think
24 that looking at black carbon and actually incentivizing
25 programs that address mitigation, even if at the

1 regional level you can't actually enforce mitigation on
2 a local level, you can put criteria in place for
3 incentivizing good projects that get funded that
4 actually mitigate those anticipated impacts.

5 That's it. Thank you.

6 MS. JORDAN: Thank you, sir.

7 So I'd like to take this opportunity to let
8 you all know again that our ushers to the left and the
9 right have the blue comment card forms. Give you
10 another opportunity to fill that out and state your
11 comment publicly, orally rather.

12 Are there any additional blue comment card
13 holders who'd like to speak?

14 So our next speaker will be Rachel
15 Hallowgrass.

16 RACHEL HALLOWGRASS: Forgive me. I came in a
17 little bit late, so I don't know what everybody else has
18 said, but I did want to say that while costs about a
19 plan like this are certainly large, and the funding by
20 its nature is certain, especially given that we don't
21 know a lot about the future economy, I just wonder about
22 the alternatives that I think not implementing a plan
23 remotely like this will be much more expensive, more
24 expensive to our children in terms of health, their
25 economy and their ability to participate in a healthy

Page 36

1 world. So in the abstract, yes, this is expensive and
2 ambitious, and, yet, the alternatives can be much worse
3 economically.

4 Thank you.

5 MS. JORDAN: Thank you for that comment.

6 So if there are no additional individuals who
7 would like to fill out the blue comment form and make
8 their comments orally, I'm going to bring the public
9 hearing to a close.

10 As I mentioned earlier, you all have the
11 opportunity, if you do not want to make your comment
12 orally, to fill out this comment form as well and drop
13 that off before you head out of the meeting and this
14 will be included in the final EIR.

15 So with that, I'm going to go ahead and close
16 the public hearing. I want to thank you all so much for
17 coming out tonight. We really appreciate your time and
18 attention.

19 Have a good evening.

20 (Hearing concluded at 7:50 p.m.)

CERTIFICATE OF REPORTER

I, SARAH L. GOEKLER, CSR No. 13446, a
Certified Shorthand Reporter, hereby certify:

That the preceding hearing was taken in
shorthand by me, a disinterested person, at the time and
place therein stated, and that the proceedings were
thereafter reduced to typewriting, by computer, under my
direction and supervision;

IN WITNESS WHEREOF, I have hereunto set my
hand this _____ day of _____, _____.

SARAH L. GOEKLER, CSR

METROPOLITAN TRANSPORTATION COMMISSION
ASSOCIATION OF BAY AREA GOVERNMENTS

PUBLIC HEARING ON THE
ENVIRONMENTAL IMPACT REPORT
FOR THE DRAFT PLAN BAY AREA

REPORTER'S TRANSCRIPT OF PROCEEDINGS

Wednesday, April 17, 2013

Martin Luther King, Jr. Library

San Jose, California

2 P R O C E E D I N G S

3 MS. CHAPLICK: Good afternoon. Thank you so
4 much for coming today. My name is Joan Chaplick. I
5 work with MIG. We're a consulting firm that is helping
6 MTC to put on today's public hearing.

7 Our purpose today is to get comments on the
8 Draft Environmental Impact Report for Plan Bay Area. So
9 when you all came in, you were given the opportunity to
10 receive a blue card. That's your speaker card.

11 If you would like to make comments during the
12 meeting, you'll need to fill out one of those. They all
13 will be brought up to me, and I will call out the names
14 in sequence and every person will get two minutes --
15 every person wanting to speak will have two minutes and
16 be able to share their comments.

17 We are also receiving your comments in
18 writing today, and you can also comment by e-mail, fax,
19 and mail. And that information will be provided to you
20 shortly. So that's our purpose.

21 Our basic agenda is we will be having a short
22 presentation by MTC planner Carolyn Clevenger. She's
23 going to provide an overview on the Draft EIR, and after
24 she concludes her presentation, then we will start the
25 public hearing.

Page 4

1 We have with us two court reporters who will
2 be transcribing all of the comments that they receive
3 today verbally, and everything we receive verbally and
4 in writing will all be treated the same way and
5 responded to in the final Environmental Impact Report.

6 So with that, I believe we are ready to get
7 started. So Carolyn Clevenger from MTC.

8 MS. CLEVINGER: Good afternoon. Thank you
9 for joining us today. As Joan mentioned, my name is
10 Carolyn Clevenger with MTC planning. I'm the project
11 manager for the EIR. Seated next to me is Mark Shorett
12 with the Association of Bay Area Governments.

13 So the purpose of this public hearing is to
14 present an overview of the Plan, as well as the Draft
15 Environmental Impact Report, which are both out for
16 public comment right now.

17 We'll be receiving your public comments here
18 on the Draft EIR, and as Joan mentioned, all responses
19 to comments and questions will be made in writing as
20 part of the final Environmental Impact Report.

21 I would just like to note that the focus of
22 the meeting today is on the Environmental Impact Report.
23 There are a number of hearings going on throughout the
24 region on the actual Plan itself.

25 The hearing for Santa Clara County will be on

1 May 1st, and there's information on a brochure at the
2 front table that has the location and time of all of the
3 remaining -- the six remaining public hearings on the
4 actual Plan itself.

5 For comments on the Plan itself, you can, if
6 you would like to, just send a comment via e-mail rather
7 than attending one of the open houses and public
8 hearings. You can send those to info@onebayarea.org,
9 and that information is also in the brochure. So if you
10 would like to grab that, that has the details.

11 The purpose of the Environmental Impact
12 Report is to analyze and disclose the potential
13 environmental impacts of implementation of the proposed
14 Plan.

15 It's meant to inform decision-makers,
16 responsible agencies, and the public of the range of
17 potential impacts. It also recommends measures that can
18 help mitigate the impacts that are found to be
19 significant, and it analyzes a range of alternatives to
20 the proposed project.

21 A little background on the Plan. It's the
22 first time in the region that we've done an integrated
23 land use and transportation plan as required by Senate
24 Bill 375. That bill does require that the integrated
25 plan reduce greenhouse gas emissions or GHG by

1 15 percent per capita by 2035, and also that the region
2 houses the region's population at all income levels.

3 The Plan was developed working off of the
4 Priority Development Area strategy that ABAG and MTC had
5 been working on for a number of years, and it focuses on
6 increasing economic competitiveness while also
7 preserving the natural environment of the region.

8 Looking from 2010 to 2040, which is the out
9 year of the Plan, the region projects -- and these are
10 projections developed by ABAG -- 1 million additional
11 jobs and roughly 2 million additional people in the
12 region by 2040. And the EIR evaluates the environmental
13 impact of accommodating that growth; it doesn't actually
14 evaluate the forecasts themselves.

15 So the focused growth strategy that the Plan
16 is built around focuses on Priority Development Areas
17 that are shown in this map -- it's the pink and purple
18 hues -- and it accounts for less than 5 percent of the
19 region's land, but it accommodates nearly 80 percent of
20 new homes and 60 percent of new jobs in the proposed
21 Plan.

22 Much of this growth is concentrated in the
23 core cities of San Francisco, San Jose, and Oakland, as
24 well as in -- 75 percent of the growth is accommodated
25 in Alameda, Santa Clara, San Mateo, and San Francisco

1 Counties.

2 Turning to the transportation side, the
3 revenues forecast for the region over the 28-year plan
4 period are \$289 billion. This pie chart shows the
5 different sources of those funds.

6 So just over half, 53 percent of those funds
7 are local funds, and that's primarily local sales tax
8 revenue. Eight of the nine counties in the Bay Area
9 have a local sales tax dedicated to transportation, and
10 that's the bulk of those funds.

11 The additional funds are: Regional, 15
12 percent is primarily from bridge tolls, and then State
13 and Federal funds. The 5 percent anticipated is based
14 on fund sources that come along during the 28-year
15 projection of the Plan that we don't necessarily know
16 about right now.

17 But based on historical trends, that's --
18 we've had about a 5 percent of new funds and new
19 programs that have come up over the life of the Plan.
20 So we do account for those in the revenue projections.

21 In terms of how the funds are spent,
22 88 percent of the funds are dedicated to operating and
23 maintaining the existing system, that includes both
24 roadways, local streets and roads, highways, and transit
25 operations, as well as transit capital replacement. The

1 remaining 12 percent is split roughly equally between
2 roadway and transit expansion.

3 The Environmental Impact Report looks at
4 impacts on 14 different environmental areas that are
5 listed here: Transportation, air quality, land use,
6 energy, climate change and greenhouse gases -- which
7 include sea-level rise analyses -- noise, geology and
8 seismicity, water, biological, visual, and cultural
9 resource, as well as public utilities, hazards, and
10 public services.

11 This presentation is available on our
12 website, so if you're trying to write this down, we can
13 let you know where it will be available.

14 Potential mitigations are identified for each
15 of the areas where there is deemed to be a potential
16 impact. Mitigations would be implemented as appropriate
17 at the local levels by local jurisdictions as they move
18 forward with projects if they're using our EIR.

19 Since MTC and ABAG cannot ensure
20 implementation of mitigation measures in all cases,
21 those issue areas shown in bold are found to still have
22 potential significant impacts.

23 Now, I had mentioned that the EIR evaluates a
24 range of alternatives. This provides some detail on
25 those alternatives that were evaluated.

1 One alternative is the No Project, and
2 that's required by California Environmental Quality Act
3 to look at the "No Project," which is the existing 2010
4 land use and transportation network, as well as those
5 funds that are deemed to be committed.

6 So 80 percent of the funds in the Plan are
7 going to projects that are either locally funded, in
8 which case the regional agencies made no discretionary
9 decision over if they move forward, or were so far along
10 in project development that they were deemed committed
11 if they were through a certain level of environmental
12 clearance.

13 Alternative 3 or the "Transit Priority Focus"
14 alternative looked at higher densities near high-quality
15 transit service. It also included an additional high
16 peak-period Bay Bridge toll, with revenues used to fund
17 additional Bart and AC transit investments.

18 The "Enhanced Network of Communities" or
19 Alternative 4 in the EIR was based on input from
20 business representatives. It included a higher
21 population growth assumptions, both for population and
22 jobs compared to the Plan.

23 It also included that higher peak-period Bay
24 Bridge toll, but in this alternative, it was used to
25 fund additional investments in the State highway system

1 maintaining the system.

2 The "Environment, Equity and Jobs" or
3 Alternative No. 5 was based on input from the equity and
4 environmental stakeholders. That alternative on the
5 land use side emphasized increasing opportunities for
6 low-income housing and communities of opportunity or
7 job-rich communities.

8 It did eliminate uncommitted roadway
9 expansion projects, and it implemented a VMT tax that
10 was used to fund increased transit operations throughout
11 the region.

12 So those were the range of alternatives that
13 were evaluated in the EIR. In terms of how the -- what
14 the analysis showed, all of the alternatives, including
15 the proposed Plan, had similar impacts.

16 Alternative 5 or the "Environmental, Equity
17 and Jobs alternative," was deemed to be the
18 Environmentally Superior Alternative in terms of its
19 overall environmental impacts. The total greenhouse gas
20 emissions were reduced the greatest in that alternative,
21 and air quality emissions were reduced the greatest in
22 that alternative.

23 However, the proposed Plan did include some
24 benefits as compared to Alternative 5. It had the
25 lowest vehicle miles traveled or VMT in the region per

1 capita. It also included lower levels of congested VMT,
2 so fewer miles that were traveled in the region at
3 congested conditions. And less agricultural and open
4 space were converted under that alternative.

5 Alternative 3 or the "Transit Priority
6 Alternative" had the least impacts in terms of
7 transportation as it featured shorter commute travel
8 times, a lesser amount of congested VMT, and the least
9 likelihood of transit crowding of the alternatives.

10 In terms on commenting on the Draft EIR, you
11 can comment either orally or in writing at today's
12 meeting. You can also send it by mail, fax, or e-mail
13 by May 16th. Our comment period closes at 4 p.m. on May
14 16th, and the contact information is listed there.

15 Again, just to note, the comments on the
16 actual -- on the overall Plan itself and the policies
17 behind the plan should be made separately at
18 info@onebayarea.org. And that information is all
19 included in that brochure at the front table.

20 In terms of our overall schedule, we are
21 right now in the middle of the EIR public hearings and
22 the Plan Bay Area public hearings. The public comment
23 period will close on May 16th.

24 And then in June and July, we will be
25 presenting summaries and responses to comments to the

1 MTC Commission and the ABAG Board, with the final
2 adoption of the Plan and EIR scheduled for July of this
3 year. And the final EIR will include, as we've
4 mentioned, a written response to each comment received
5 on the EIR.

6 So with that, I'll turn it back to Joan.

7 MS. CHAPLICK: Okay. Thank you. So thank
8 you for your presentation, Carolyn.

9 Now we will be opening the public hearing.
10 Our court transcribers will be taking down exactly what
11 you say. And if you would like to speak, I need you to
12 fill out a blue comment card.

13 So I have received one, and I would like to
14 bring -- Ivana Yeung will be our first commenter.

15 There are MTC staff who are collecting
16 comments, and they'll bring them up to me. We'll just
17 line up, and we'll hear everyone's comments.

18 Each person gets two minutes to comment. And
19 Leslie up front is our timer. She has a timer that when
20 the alarm goes off, you'll need to bring your remarks to
21 a close. So that's our process. And with that, we will
22 start with our first comment.

23 Please state your name and where you're from
24 for the record.

25 IVANA YEUNG: Hi. Good afternoon. My name

1 is Ivana Yeung. I'm with the County Roads and Airports
2 Department.

D3-A1

3 We had a comment regarding the transportation
4 section, which is 2.1. We had read that there were
5 going to be significant unavoidable regional impacts.

6 While we realize that is probably going to be
7 the case, we are wondering if there were going to be
8 plans to have a map or some analysis for the Santa Clara
9 County in particular, just because we understand that we
10 have a lot of employment areas here, but I feel that a
11 lot of the congested VMT miles are going to be in the
12 Santa Clara County. Are there any plans to include that
13 in the EIR.

14 MS. CHAPLICK: Questions will just be
15 recorded and responded to in the final EIR.

16 IVANA YEUNG: Okay.

17 MS. CHAPLICK: Okay. Thank you.

18 Our next commenter, I have a card from Ed
19 Mason. And please introduce yourself and where you are
20 from for the record.

21 ED MASON: Good afternoon. Ed Mason of San
22 Jose.

D3-B1

23 And on Page 1-2-7, it says that there's going
24 to be an increase in the number of seniors that will be
25 in the downtown areas. I really find that hard to

1 believe in the Bay Area. It might be happening across
2 the nation, but there are two articles that basically
3 say, nobody is going anywhere for the baby boomers that
4 are retiring.

5 It's been my experience in roundtable and
6 personal surveys that basically seniors are going to age
7 in place and not go into the downtown areas, and I
8 believe that only the wealthy move to Rincon Hill in San
9 Francisco.

D3-B2

10 Also, there is no mention on Page 1-2-24.
11 There's jobs and prosperity. There is no mention made
12 of the corporate commuter buses. If they were a transit
13 agency, they would be at about six or seven as the
14 largest transit agency.

15 The real estate ads in San Francisco tell
16 that the residences for sale in nearby neighborhood
17 stops. And the housing quota that is going to be
18 allocated in San Francisco or any other location, who is
19 the residence really going to be designated for?

20 You know, if you've got all these commuter
21 buses going around, it implies -- even in San Francisco,
22 you've got 24 percent of the population that goes out of
23 the city, and it's a consequence. If you are going to
24 assign a housing allocation to San Francisco as an
25 example, why -- we've got commuter buses going on. So

Page 15

1 they don't live where they work. You know, the company
2 town is extinct.

3 But that's one way that I think there really
4 needs to be a reevaluation by businesses to not get into
5 this mode of saying, Well, you can live in hip San
6 Francisco and congest all the neighborhood streets with
7 the commuter buses but, you know, you can live here.

8 Highway investment. We always wind up
9 mitigating everything and we widen. We've widened 880
10 in '96 and 2000. Now we're going to widen Old Oakland
11 Road. Well, what happens if we did nothing and really
12 made commuting a painful experience? Because your
13 projections indicate that over the near term in long
14 term, it's only going to be a few more minutes increased
15 in commuting time.

D3-B3 16 Well, if you want to reduce the greenhouse
17 gases, let's make -- you know, don't do anything and
18 just let everybody kind of suffer, and then maybe
19 they'll get the message, because eventually, they may be
20 commuting with the fish as the sea level rises. So I
21 think that needs to be a message that's not being made.

22 MS. CHAPLICK: If you could wrap up your
23 comments, sir.

D3-B4 24 ED MASON: Yeah. And also, 75 percent of the
25 jobs are half a mile off of a freeway exit, and only

1 25 percent are within the 88 rail stations. So there
2 seems to be a mismatch that maybe we should be
3 encouraging more commuter buses.

4 Are my two minutes up?

5 MS. CHAPLICK: Yes, your two minutes are up,
6 sir.

7 ED MASON: Sorry.

8 MS. CHAPLICK: Thank you for your comments.

9 If you do have additional remarks that you
10 would like to share, feel free to add them to a comment
11 form and turn them in, or also comment -- send
12 additional comments by e-mail, fax, or mail.

13 I have no other blue speaker cards, so if
14 there's anyone who would like to speak, I'll give you a
15 minute to fill that out. Our main purpose is to receive
16 comments. So we don't have a question-and-answer
17 portion. And any questions that you have will be
18 responded to in the final EIR.

19 So if you would like to make a comment for
20 the record, we'll need your speaker card.

21 AUDIENCE PARTICIPANT: This is not a comment,
22 it's a question on the presentation.

23 MS. CHAPLICK: You know, we're -- I'm sorry.
24 We are not taking questions on the presentation. So
25 they're all -- it's all part of the CEQA process, where

1 we receive the comments.

2 AUDIENCE PARTICIPANT: I'll make a comment.

3 MS. CHAPLICK: Okay. So I'm going to give --
4 I'll give you a few minutes. If you have --

5 AUDIENCE PARTICIPANT: So --

6 MS. CHAPLICK: Sir, I'm needing speaker
7 cards, if you would like to speak. So we are going to
8 give people a moment to fill out a speaker card, and
9 then it's two minutes per person.

10 So we have someone coming up here. We'll
11 just need your name for the record. I have a card from
12 Michael Ludwig. Okay, Michael. And you have two
13 minutes to comment.

D3-C1

14 MICHAEL LUDWIG: Okay. Yes. Sorry I got
15 here late, but I just was wondering why -- I mean, I
16 don't know what exactly the lists of projects are in the
17 Plan Bay Area, so I'm thinking you might be doing this
18 kind of backwards to be holding the environmental
19 hearing before the hearing for the list of projects.

20 And so I'm just wondering about that, and I
21 just want to make sure that you encourage jobs and
22 housing as close to transit as much as possible.

23 MS. CHAPLICK: Thank you for your comment.

24 Our next speaker is Don Conners.

D3-D1

25 DON CONNERS: I know an awful lot of very

1 intelligent and highly educated people worked very hard
2 on doing this Bay Area Plan and the Environmental Impact
3 Report, so I don't mean to impugn your competence or
4 motives; however, let's look at the history of past
5 projections.

6 In the middle '70s, we put the first fuel
7 economy standards in. It was supposed to save an awful
8 lot of oil because we were going to use less oil in our
9 cars. So over the subsequent years, the fuel economy
10 standard of people on the road roughly doubled. Savings
11 in oil, none, because miles per car also doubled
12 exactly, offsetting that.

13 We also have the record of light rail in San
14 Jose, where the cost estimates kept going up and up and
15 up, the ridership estimates kept going down and down and
16 down, and the operating costs were tremendous. And
17 that's just in San Jose. The same thing happened with
18 BART earlier. It's doing well now, but it took an awful
19 lot of time to get there.

20 What makes you think that your planning is
21 any better than the past record?

22 MS. CHAPLICK: Okay. Thank you for your
23 comment.

24 Our next speaker is Hilda, and I will let you
25 pronounce your last name.

D3-E1

1 HILDA LAFEBRE: Hilda Lafebre with San Mateo
2 Transit representing Caltrain in San Fran.

3 I saw in the presentation four alternatives;
4 however, you mentioned a fifth alternative. Does that
5 mean that in the document we will see five alternatives
6 or four alternatives?

7 MS. CLEVINGER: The proposed Plan is the
8 other alternative. So it's the No Project, the Proposed
9 Plan, and then the three additional alternatives that I
10 described in more detail.

11 HILDA LAFEBRE: Okay.

12 MS. CLEVINGER: So yes, since the previous
13 slides went into detail on the Proposed Plan, I didn't
14 include that in that alternatives chart.

15 HILDA LAFEBRE: All right. Thank you.

16 MS. CHAPLICK: I apologize for my break from
17 process.

18 Do we have -- I have no other blue speaker
19 cards.

20 JIM BITTER: I have --

21 MS. CHAPLICK: Please fill out a speaker
22 card, and we'll have your name, and your comments can be
23 entered into the record. I'll give you just a minute or
24 so to fill that out.

25 If we don't have any more people wanting to

1 speak, we will close the public hearing portion of the
2 meeting.

3 JIM BITTER: I'd like to speak.

4 MS. CHAPLICK: Yes. Just get me a card.

5 JIM BITTER: I have a card right here.

6 MS. CHAPLICK: Okay. And if you can state
7 your name for the record. And the card, I just -- the
8 court reporters use it to get your --

9 JIM BITTER: My name is Jim Bitter,
10 B-I-T-T-E-R, and I'm from Mill Valley, California. I'm
11 up north of the Golden Gate Bridge.

12 Why am I down here getting lost in San Jose?
13 I'm down here because I care about my country. I care
14 about college kids that are the next generation that are
15 having trouble finding jobs when you get out of here.
16 You are going to have a big debt to pay when you get out
17 of here.

18 And on top of that, you are going to be
19 paying for all of this, and it's wonderful stuff. It's
20 housing, transportation, green stuff, green stuff, green
21 stuff everywhere, but there is no money at the federal
22 level. \$17 trillion, going to 22 trillion. \$80 billion
23 in debt in California.

24 The consultants that are here, MTB -- or not
25 MTB, but the -- I need to take a breath here. The

Page 21

1 Metropolitan Transit Commission, an \$11.5 million
2 bureaucracy, the consultants, ICF International, the
3 company that did the Environmental Impact Report, that's
4 Dyett & Bhatia.

5 This is San Jose. It's a big place, and you
6 have how many people here? So you have invested -- they
7 won't tell us what this costs. And it's on my computer,
8 and I didn't hit print, because I -- but we're all
9 paying for this thing.

10 You know, 99.99 percent of the public is not
11 going to read it, they'll never see it, and I pity the
12 next generation that has bought all of this and that is
13 having to pay for it.

14 So what else can I say? I got lost coming
15 down here.

16 So anyway, these meetings were conveniently
17 arranged during the day when people couldn't get here.
18 They have two at a time. The one up in Marin was
19 arranged so that the Board of the Supervisors couldn't
20 come. They're the ones who are responsible for this.
21 Darrell Steinberg, who drafted the legislation, the
22 legislature, the California Air Resources Board, they're
23 all responsible for this.

24 The next generation, the college kids at San
25 Jose and other places, are going to pay for all of this,

Page 22

1 so good luck, because the old people are set. But you,
2 you are going to -- they're going to be in your wallet,
3 big time.

4 MS. CHAPLICK: Thank you for your comments,
5 sir.

6 Do I have any more -- anyone wanting to fill
7 out a speaker card and speak?

8 Okay. With that, we will close the public
9 hearing and will -- you know, the MTC folks, we will be
10 collecting comment cards, if you want to provide us
11 written comments. But that's all we have for now, so
12 with that, we are adjourned. And feel free, again, to
13 stay and provide some additional written comments, if
14 you prefer.

15 Thank you.

16 (Hearing concluded at 1:32 p.m.)

CERTIFICATE OF REPORTER

I, AUDREY L. TAKATO, CSR No. 13288, a Certified
Shorthand Reporter, hereby certify:

That the preceding hearing was taken in shorthand
by me, a disinterested person, at the time and place
therein stated, and that the proceedings were thereafter
reduced to typewriting, by computer, under my direction
and supervision;

IN WITNESS WHEREOF, I have hereunto set my hand
this _____ day of _____, _____.

AUDREY L. TAKATO

CSR No. 13288

This page intentionally left blank.

3.9 Oral Testimony at EIR Hearings

PUBLIC HEARING ON DRAFT EIR – SAN RAFAEL (4/16/2013)

D1-A Peter Hensel

- D1-A1: All development, whether under this Plan or otherwise, must comply with the Federal Endangered Species Act.
- D1-A2: The provision cited is just one of many possible measures listed under Mitigation 2.9(a) to be considered by implementing agencies and/or project sponsors based on project-and site-specific considerations. That measure might work best at project sites with available seating.
- D1-A3: Plan Bay Area must accommodate the regional growth expected through 2040. This growth is expected to occur with or without the proposed Plan. Regarding adequate water supplies, please see Chapter 2.12 of the Draft EIR and Master Response G.

D1-B Richard Hall

- D1-B1: MTC and ABAG acknowledge your frustration. Regarding the instances you cited, these are part of local planning efforts in San Rafael and beyond the decision-making ability of MTC and ABAG. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.
- D1-B2: Traffic reduction trends such as greater telecommuting were incorporated into MTC's transportation model for the proposed Plan and all the alternatives. See response C151-20 for more information on telecommuting. Regarding new car technologies, please see Master Response D.1 for details on the limits of what Plan Bay Area is allowed to include in reaching the SB 375 target.
- D1-B3: Your support for the No Project alternative is acknowledged.

D1-C Clayton Smith

- D1-C1: Regardless of any differences of opinion on the causes and existence of climate change, Plan Bay Area is bound to adhere to the GHG emissions reductions targets established by SB 375.
- D1-C2: See Master Response B.1 for explanation of the different population projections provided by ABAG and the California Department of Finance.

- D1-C3: The Draft EIR notes on p.1.2-52 that, “MTC and ABAG do not have land use authority. Implementation of the land use strategy will require its adoption by the local jurisdictions in the Bay Area; local governments (the nine counties and 101 cities of the region) have sole authority to create and implement land use plans.” See Master Response A.1 for additional information regarding local control over land use.
- D1-C4: The budget for the transportation investments comes from multiple sources including the State and federal governments as well as local funds and fees. MTC does not set the budget, but rather must create a regional transportation plan (RTP) that is financially constrained to the anticipated budget. This budget is substantially similar to the budgets in prior RTPs.
- D1-C5: See Master Response A.1 regarding local control over land use. Your opposition to the proposed Plan is acknowledged.

D1-D Carolyn Lement

- D1-D1: See Master Response C regarding the request to extend the public comment period.
- D1-D1.5 See Master Response D.2 for an explanation of the connection between high-density housing and reduced greenhouse gas emissions.
- D1-D2: The comment refers to placing housing in landslide-prone areas, the risks of which are assessed in Chapter 2.7, Geology and Seismicity. Impact 2.7-4 discusses exposure of people or structures to substantial risk related to landslides.
- D1-D3: Plan Bay Area has allocated growth to areas throughout the region where land development is feasible, where it may support transportation options that reduce greenhouse gas emissions, and where environmental impacts can be avoided or mitigated, as feasible. The comment makes reference to development on areas where there are toxic sites (discussed in Chapter 2.13, Hazards), where air pollution may have adverse health effects (discussed in Chapter 2.2, Air Quality), and near cell phone towers (not discussed in this EIR, as it is not an issue area covered by CEQA). For toxic sites and air quality, impacts are assessed and mitigation measures provided that would reduce most of these impacts to a less than significant level, and further site-specific mitigation may be identified by the further environmental review required of all individual projects. This EIR only assesses the entire proposed Plan at a regional level. See Master Response A.3 regarding the level of specificity in the program EIR.
- MTC and ABAG respectfully disagree with the statement that the EIR process has been “scripted from the beginning.” See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan.
- D1-D4: The planning and environmental review processes have been going on for several years. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review

process for the Draft EIR. The EIR already includes Alternatives 4 and 5 developed by outside parties – see Chapter 1.2 of the Draft EIR for a description of the Plan development process and Chapter 3.1 for a description of the alternatives screening process.

D1-E Nona Dennis

- D1-E1: See Master Response B.1 for more information regarding population projections, including a discussion of the relationship between ABAG and DOF projections.
- D1-E2: Growth-inducing impacts of the Plan, including job growth, are discussed in Chapter 3.2 of the Draft EIR, beginning on page 3.2-4. See Master Response A.3 regarding the level of specificity in the Program EIR.
- D1-E3: See Master Response E for more information regarding sea level rise, including a discussion of the projection year chosen for this issue area.

D1-F Susan Kirsch

- D1-F1: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.
- D1-F2: Per CEQA regulation 15126.6, “If the environmentally superior alternative is the ‘no project’ alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives.” However, in the case of this EIR, Alternative 5, not the No Project alternative, was found to be the environmentally superior alternative – see Chapter 3.1 of the Draft EIR for a comparative impact analysis of all the alternatives and the explanation for the selection of the environmentally superior alternative.
- D1-F3: Local control over land use decisions will be maintained and local jurisdictions’ decisions to amend their general plans to achieve consistency with Plan Bay Area are entirely voluntary. See Master Response A.1 for more information regarding local control over land use.
- D1-F4: The comment refers to the Plan, rather than the Draft EIR, which provides environmental assessment of the Plan. However, the comment is correct in its statement regarding targets for equitable access. In the *Plan Bay Area Draft Performance Assessment Report* published by MTC in March 2013, it was found that the proposed Plan is expected to increase the share of low-income and lower-middle income residents’ household income consumed by transportation and housing by three percent. While this result moves in the opposite direction from the Plan’s objective, the proposed Plan would perform better than the No Project alternative, which is estimated by the same report to increase this metric by eight percent. In other words, the proposed Plan provides a beneficial rather than deleterious impact compared to the No Project alternative

Page 109 notes that the proposed Plan would result in a two percent increase in percent of income spent on housing and transportation by low-income households, and a two percent increase for all other households, but it also shows that the proposed Plan outperforms the No Project alternative on both measures, which would increase the percent of income spent by eight percent for low income households and three percent for all other households. These findings suggest that this issue would worsen without the proposed Plan.

D1-G Linda Rames

D1-G1: As the regional transportation agency and decision-maker on the Plan, MTC is the appropriate CEQA lead agency for Plan Bay Area. This is similar to cities or counties being the lead agencies for their general plans. It should be noted that ABAG and MTC are joint lead agencies for Plan Bay Area.

D1-H Al Dugan

D1-H1: See Master Response C regarding the request to extend the public comment period.

D1-H2: See Master Response B.1 for more information on development of population projections. This response includes a discussion of the relationship between ABAG and DOF projections, as well as migration assumptions.

D1-H3: See Master Response B.1 for more information on development of population projections and allocation of growth.

D1-I Harry Brophy

D1-I1: Maintenance of water conveyance systems in Marin County is the responsibility of the Marin Municipal Water District and other water suppliers. If there is an existing issue with their pipe capacity, that issue and related impacts are not caused by the proposed Plan, and should be a capital project included in its Urban Water Management Plan. Furthermore, Mitigation Measure 2.12(h) of the Draft EIR states that, “For projects that could increase demand on water and wastewater treatment facilities, project sponsors shall coordinate with the relevant service provider to ensure that the existing public services and utilities could be able to handle the increase in demand. If the current infrastructure servicing the project site is found to be inadequate, infrastructure improvements for the appropriate public service or utility shall be identified in each project’s CEQA documentation. The relevant public service provider or utility shall be responsible for undertaking project-level review as necessary to provide CEQA clearance for new facilities.” MTC and ABAG cannot require local implementing agencies to adopt the above mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. However, any project seeking CEQA streamlining under SB 375 will have to apply Mitigation Measure 2.12(h).

D1-I2: MTC and ABAG are the lead agencies for this EIR. Please see Master Response A.1 for more information regarding local control over land use.

D1-I3: See comment D1-I1.

D1-J Ray Day

D1-J1: This EIR evaluates Plan Bay Area as a single, regional plan and assesses its impacts at a regional level across all nine counties, which is consistent with CEQA provisions regarding program EIRs. The individual projects that may result from the Plan—transportation improvements and land use development—will require their own individual environmental analyses. A county-level evaluation of the proposed Plan and its impacts would be at a greater level of detail than required by law. Impacts have been assessed at a regional level and a conceptual localized level. County level information has been provided in the EIR when feasible, but does not represent an obligation to evaluate all impacts at that level. See Master Response A.3 regarding the level of specificity in the EIR.

D1-J2: Impacts on schools as a result of growth are discussed in Chapter 2.14, Public Services and Recreation. Although the California public school system is under the policy direction of the Legislature, the California Department of Education relies on local control for the management of school districts. School district governing boards and district administrators allocate resources among the schools of the district. Regional growth, which is anticipated to occur regardless of the implementation of the proposed Plan, will require the expansion of public school facilities throughout the region. Because standards for both public schools are determined at the local level, and because impacts on existing facilities would vary substantially throughout the region, it is infeasible for this EIR at the regional scale to determine the exact scale and location of impacts on school districts region-wide. At the local level, school impact fees may be used by local school districts to build new or expand existing schools to accommodate new enrollment. Chapter 1.1 of the Draft EIR notes that, “CEQA streamlining benefits will still need to obtain discretionary permits or other approvals from the lead agency and the local jurisdiction, in accordance with local codes and procedures, including any agreements related to zoning, design review, use permits, and other local code.” This would include impact fees, and would obviously extend to non-streamlined development that tiers off this EIR as well.

While housing affordability is a concern of Plan Bay Area, the Plan does not go so far as to mandate affordability levels of potential development on specific sites. Local governments retain control over the right to approve proposed development projects within their jurisdiction; please see Master Response A.1 regarding local control over land use.

D1-K Margaret Kettunenzesar

D1-K1: The comment is correct to note that some PDAs intersect with mapped 100-year flood hazard areas. Impacts and mitigation measures pertaining to this topic are discussed in Chapter 2.8, Water Resources.

D1-K2: Impacts related to climate change are discussed for the entire region, including areas where population growth is anticipated to occur. More detailed project-level assessments may be required for individual sites or projects. Please see Chapter 2.5, Climate Change, for a discussion of related impacts and mitigation measures. See also Master Response D.1 regarding SB 375’s GHG reduction targets.

D1-K3: Impacts on the regional transportation system are discussed in Chapter 2.1. However, the impacts discussed are regional in nature, and individual roadways are not analyzed specifically. Projects in and around Marin County will have to analyze impacts on relevant roadways in their individual environmental review. At the same time, it is a goal of Plan Bay Area to promote development of housing in such a way that transit is better supported, to offer transportation alternatives to congested highways. See Master Response A.3 regarding the level of specificity in the EIR.

D1-K4: Economic impacts are not an environmental issue area under CEQA and thus are not analyzed in this EIR.

D1-L Pam Drew

D1-L1: See Master Response B.1 for more information regarding population projections and the relationship between DOF and ABAG growth forecasts.

D1-L2: Please see Master Response G for more information on water supply. Regarding Bay encroachments, the Draft EIR notes in Mitigation Measure 2.9(h) that all development under the proposed Plan would need to be in conformance with the applicable local coastal program or San Francisco Bay Plan and involve the California Coastal Commission or BCDC as early as possible in the project-level EIR process. See Master Response E for more information on sea level rise. In addition, MTC and ABAG respectfully disagree that homeowners, as a group, have not been heard in the planning process. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

D1-M Jean Rieke

D1-M1: This comment concerns the substance of Plan Bay Area itself, not the Draft EIR, which provides environmental review of that plan. This comment does not raise environmental concerns under CEQA. With regards to the comment that mentions top-down government and local control, please refer to Master Response A.1 for more information on local control of land use and environmental review.

D1-N Nancy Ocada

D1-N1: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

D1-N1.5: The comment concerns economics, which is not an environmental issue area under CEQA and thus is not analyzed in this EIR. See Master Response B.2 regarding PDA feasibility.

D1-N2: CEQA streamlining is an aspect of SB 375 and is described in more detail in Master Response A.2.

D1-N3: Your support for the No Project alternative is acknowledged.

D1-O Robert Chilvers

D1-O1: Plan Bay Area and the EIR do not make recommendations for specific development projects on specific sites. The general locations for future land use development are mostly Priority Development Area (PDAs), which were defined voluntarily by local jurisdictions. The Draft EIR contains an analysis of conflicts with existing visual and cultural resources, such as architecture, in Chapters 2.10 and 2.11 and includes mitigation measures as appropriate, although MTC and ABAG lack land use authority so implementation of those measures is the responsibility of the local land use jurisdiction. Please see Master Response A.1 regarding local control over land use for more detail on this topic. Additionally, this EIR analyzes impacts at a regional scale and did not evaluate traffic impacts on US 101 in particular; specific projects will be required to analyze impacts at the local level in project-level environmental assessments. See Master Response A.3 regarding the level of specificity in the EIR.

D1-P Elizabeth Moody

D1-P1: MTC and ABAG acknowledge your support for the regional planning process.

D1-Q Margaret Nan

D1-Q1: This comment concerns the substance of Plan Bay Area itself, not the Draft EIR, which provides environmental review of that plan. This comment does not raise environmental concerns under CEQA.

D1-Q2: Impacts on schools as a result of growth are discussed in Chapter 2.14, Public Services and Recreation.

D1-R Ann Spake

D1-R1: MTC and ABAG respectfully disagree that profitability of development of individual sites was a determining factor in allocating growth throughout the region. The distribution of housing units and jobs in the Draft Plan takes into account a variety of factors—including input from jurisdictions, level of transit service, Vehicle Miles Travelled by Household, in-commuting by low-wage workers, housing values, existing employment, and concentration of knowledge-based economic activity. In some cases, the distribution assumes changes in local conditions over the next three decades, and is not constrained by existing zoning. This approach was a key element of creating a distribution of jobs and housing growth that achieved the region's Greenhouse Gas Emissions reduction target.

MTC and ABAG assume the comment about healthy housing refers to the air quality analysis in Chapter 2.2 of the Draft EIR. The analysis includes mitigation measures that

would reduce most impacts to a less than significant level—if implemented by local land jurisdictions—although that would not be possible in all instances. The EIR does note that impacts on future sensitive receptors may need to be evaluated in project-level environmental review, which could recommend additional mitigation measures depending on the location, design, and other factors of that individual project. See Master Responses A.1-A.3 regarding local control over land use, CEQA streamlining, and the level of specificity in the EIR.

The comment is correct to state that the proposed Plan would include more roadways subject to potential sea level rise than the No Project alternative, as well as Alternative 5. The proposed Plan would include a comparable number of transportation projects subject to sea level rise as Alternatives 3 and 4; Table 3.1-56 in the Draft EIR has been corrected in Section 2 of this Final EIR to show that the No Project alternative is the environmentally superior alternative for Impact 2.5-5. See Master Response E regarding sea level rise.

D1-R2: The comment is correct to state that the proposed Plan of all the alternatives would place the most residents within low-lying areas at risk of inundation due to sea level rise, that the proposed Plan does not have the least impact with regards to air quality (that is Alternative 5), and that the EIR does not examine the effects on air quality from specific land use or transportation improvements in the proposed Plan. The EIR evaluates Plan Bay Area as a single, regional project and assesses its impacts at a regional level across all nine counties, which is consistent with CEQA provisions regarding program EIRs. The individual projects that may result from the Plan (transportation improvements and land use development) will require their own individual environmental analyses. Impacts have been assessed at a regional level and a conceptual localized level. County level information has been provided in the EIR when feasible for informational purposes. See Master Responses A.1-A.3 regarding local control over land use, CEQA streamlining, and the level of specificity in the EIR.

D1-R3: The comment is correct to state that the analysis finds a net increase in emissions of PM₁₀ and TACs from mobile sources compared to existing conditions, and that under the proposed Plan a net increase in sensitive receptors' exposure to TACs in TPP corridors could occur. Contrary to the comment's assertion that the EIR considers this to be no adverse impact, the EIR recognizes these impacts to be significant and unavoidable. Please see Chapter 2.2 of the Draft EIR for more information. Chapter 3.1 also concluded that all significant and unavoidable air quality impacts under the proposed Plan would also be significant and unavoidable under the No Project alternative as well as all other alternatives.

D1-R4: The comment is correct to state that implementation of the proposed Plan could result in a localized larger increase or smaller decrease of TACs and/or PM_{2.5} emissions in disproportionately impacted communities compared to the remainder of the Bay Area communities. The EIR has determined that this is a significant and unavoidable impact. However, the impact is also significant and unavoidable for all other alternatives as well, including the No Project alternative. See Master Response F regarding regional displacement and the Equity Report included in Appendix 1 of Plan Bay Area for information regarding efforts to address this issue.

D1-R5: Contrary to the comment, the Draft EIR found that increases in traffic volumes would generally be the result of projected growth that will occur with or without the Plan, and that compared to the proposed Plan, conditions under the No Project alternative would result in substantially greater commute travel times, slightly longer non-commute travel times, substantially greater congestion, and significantly greater vehicles miles travelled. As a result, the proposed Plan would provide a positive rather than deleterious effect on traffic (see Table 3.1-56 of the Draft EIR). Also contrary to the comment, Chapter 2.5 of the Draft EIR also found that the proposed Plan would result in a decrease in GHG emissions. The Plan does not propose the “dense structures with many small single units” that you mention but rather proposed a land use development pattern and references expected demographic trends which will both likely lead to greater development of attached townhouses and multi-family units, which could include many different types of housing and size, and does not mandate the type of housing to be built.

D1-S Julie Leitzell

D1-S1: The comment does not raise environmental issues under CEQA. However, for more information regarding local control over land use, please see Master Response A.1.

D1-T Carol Sheerin

D1-T1: MTC and ABAG acknowledge your comment regarding the importance of public participation in this process. MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

D1-U Sue Beittel

D1-U1: The comment does not raise environmental issues that require a response under CEQA.

D1-V Joy Dahlgren

D1-V1: See Master Response A.1 regarding local control over land use planning and Master Response D.2 regarding GHG reduction benefits of transit oriented development.

D1-W Vincent Welch

D1-W1: The comment does not raise environmental issues that require a response under CEQA.

D1-X Brendan Burke

D1-X1: See Master Response B.1 for more information regarding growth projections and the relationship between DOF and ABAG data.

D1-X2: The commenter is incorrect in stating that SB 375 is a non-compulsory guideline and not State law. SB 375 was adopted as State law in 2008, and as regional transportation and planning agencies, MTC and ABAG are required to comply. (See Government Code § 65080(b)(2), *et seq.*) However, local jurisdictions such as Marin County will maintain control over local land use decisions. Please see Master Response A.1 for more information on this distinction.

D1-X3: MTC and ABAG acknowledge your comment regarding the importance of public participation in this process. MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

D1-Y Jim Bitter

D1-Y1: The comment does not raise environmental issues that require a response under CEQA.

D1-Z Barbara Salzman

D1-Z1: As stated in Chapter 2.0 of the Draft EIR, “as a program-level EIR individual project impacts are not addressed in detail; the focus of this analysis is to address the impacts which, individually or in the aggregate, may be regionally significant.” As such, impacts on specific locations, such as biological resources along the US 101 corridor, are more appropriately dealt with as part of detailed local analyses. Endangered species and critical habitats are explicitly discussed in the Draft EIR in Chapter 2.9, Biological Resources. However, the level of analysis should again be noted: the EIR evaluates Plan Bay Area as a single, regional project and assesses its impacts at a regional level across all nine counties, which is consistent with CEQA provisions regarding program EIRs. See Master Response A.2 for more information on further environmental review that will be required of individual projects and Master Response A.3 regarding the level of specificity in the EIR.

D1-Z2: See Appendix J of the Draft EIR, added through Section 2 of this Final EIR, for a full list of PDAs.

D1-Z3: While it is beyond the scope of this EIR to address past decisions of MTC and ABAG, one intention of the proposed Plan is to tie a small amount of grant funding from MTC and ABAG, under the OneBayArea Grant (OBAG) program, to planning for infill development within Priority Development Areas (PDAs). OBAG directs approximately 4.9 percent of total funding in Plan Bay Area to the Congestion Management Agencies to support implementation of the Plan. In the case of North Bay Congestion Management Agencies (CMAs) such as the Transportation Authority of Marin, 50 percent of these OBAG funds are required to be spent on projects in or linked to PDAs. The proposed Plan would not prohibit MTC and ABAG from providing money toward a project such as development around the Larkspur ferry terminal; however, as described above, eligibility for some OBAG funding is contingent upon a project being located in or serving a PDA.

D1-AA Stephen Nestel

D1-AA1: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

D1-BB Marjorie Macris

D1-BB1: The impact of sea level rise on Priority Development Areas is discussed in Impact 2.5-6, starting on page 2.5-68 in Chapter 2.5, Climate Change and Greenhouse Gases. See Master Response E for more information regarding sea level rise, including a discussion of the projection years used.

D1-BB2: See Master Response E for more information regarding sea level rise, including a discussion of the projection years used. See also Master Response A.3 regarding the level of specificity in the EIR.

D1-CC Lilie Crocker

D1-CC1: The comment does not raise environmental issues requiring a response under CEQA.

D1-DD Susan Wernick

D1-DD1: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

PUBLIC HEARING ON DRAFT EIR – OAKLAND (4/16/2013)

D2-A Charlie Cameron

D2-A1: The comment does not raise environmental issues that require a response under CEQA.

D2-B Myesha Williams

D2-B1: Your support for Alternative 5 is acknowledged. Regarding the comment that the Draft EIR does not adequately analyze the VMT and GHG reduction that this alternative would offer, all alternatives have been analyzed at a lesser level of detail than the proposed Plan. Per CEQA Guidelines section 15126.6(d), the impacts of the alternatives may be discussed “in less detail than the significant effects of the project proposed.” The Guidelines also permit analysis of alternatives at a less detailed level for program EIRs, compared to project EIRs. The Guidelines do not specify what would be an adequate level of detail. Quantified information on the alternatives is presented where available; however, in some cases only

partial quantification can be provided because of data or analytical limitations. Detailed tables comparing traffic impacts of the alternatives are included in Chapter 3.1 of the Draft EIR (pages 3.1-24 to 31) and GHG emissions due to transportation and land use are quantified for all alternatives in Chapter 3.1, beginning on page 3.1-57; some of these have been revised as shown in Section 2 of this Final EIR. See responses B25-21 through B25-23 regarding the adequacy of the EEJ alternative.

Reductions in VMT can be provided in a variety of ways. Reduction associated with the integration of transportation and land use planning generally require a combination of frequent, reliable transit along with land use development that is oriented to utilize this transit service. See Master Response D.2 for more on this issue. Plan Bay Area is tasked with more than reducing VMT, but must also provide transportation for many different locations and users around the region.

MTC and ABAG respectfully disagree with the assertion that Alternative 5 is the best option at reducing VMT; the Draft EIR in Chapter 3.1 found that the proposed Plan has the greatest decline in per capita VMT of the alternatives, while Alternative 5 has the largest decline in overall VMT. MTC and ABAG acknowledge that Alternative 5 would result in the highest levels of transit ridership.

D2-C Devilla Ervin

D2-C1: See Master Response F for more information regarding displacement. Your support for Alternative 5 is acknowledged. Your request to incorporate measures as proposed in Alternative 5 will be considered by decision-makers as part of the EIR certification process and action on the proposed Plan.

D2-D Brenda Barron

D2-D1: This issue is addressed in Chapter 2.1 of the Draft EIR, which analyzes transit capacity exceedance under Impact 2.1-5, and which found that the proposed Plan would have no adverse impact on transit capacity on a regional level. However, it is acknowledged there may be instances of local crowding not captured in the analysis. See Mater response A.3 regarding the level of specificity of this program EIR. The Draft Plan increases daily transit seat-miles by 27 percent, including a 10 percent increase in local bus daily seat-miles and a 29 percent increase in heavy rail daily seat-miles, as shown on page 2.1-27 of the Draft EIR. Much of this additional transit service is targeted to improve the region's busiest transit services. Many of the busiest Muni, AC Transit, and VTA bus lines will be upgraded to bus rapid transit service with greater frequency and an improved rider experience. The heavy rail BART system will also benefit from additional frequency within the urban core of the system, as a result of investments in the BART Metro Program.

As shown on page 2.1-37 under impact criteria 2.1-5, no significant regional transit capacity impacts are expected under the Draft Plan, as regional transit utilization remains well below the 80 percent threshold. While the Environment, Equity, and Jobs alternative has a slightly lower potential for transit vehicle crowding, as noted on page 3.1-20, "no alternatives evaluated have issues with excessive regional transit demand – for all modes during all time

periods, transit utilization levels remain well below the 80 percent exceedance threshold. All alternatives are expected to have no adverse impact related to transit utilization.”

D2-E Pamela Tapia

D2-E1: See Master Response F for more information regarding displacement and Master Response B.1 for more information regarding the population projections.

D2-E2: This issue is addressed in Master Response F on displacement. The analysis in the Draft EIR supports the conclusion that the Plan maintains the current proportion of the work force that in commutes to the region. See responses B7-9 and B7-12 for more information on in-commuters.

D2-F Woody Little

D1-F1: For information regarding displacement, see Master Response F.

D1-F2: Your support for Alternative 5 is acknowledged. See responses B25-21 through B25-23 regarding the adequacy of the EEJ alternative.

D1-F3: See Master Response F for more information regarding displacement.

D2-G Teadora Taddeo

D2-G1: Your support for Alternative 5 is acknowledged.

D2-H Signe Mattson

D2-H1: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

D2-H2: Food security is not an environmental impact caused by the Plan that requires analysis under CEQA. Please see Master Response A.3 regarding the level of specificity in the EIR.

D2-H3: See Master Response A.2 for more information regarding CEQA streamlining. This streamlining is a component of SB 375 and is not under the purview of MTC and ABAG or this EIR.

D2-H4: Installation of air filtration to reduce cancer risks and PM exposure for residents, and other sensitive populations, in buildings that are in close proximity to freeways, major roadways, diesel generators, distribution centers, railyards, railroads or rail stations, and ferry terminals is one mitigation measure identified in Chapter 2.2, Air Quality, to reduce the impacts on sensitive receptors from stationary and mobile sources of TACs and PM_{2.5}. Like all mitigation measures identified in the proposed Plan, this can be considered by implementing agencies and/or project sponsors where feasible based on project-and site-specific

considerations, but does not represent the only possible or appropriate mitigation measure to address these impacts. See Master Response A.1 and A.2 regarding local control over land use planning and CEQA streamlining.

- D2-H5: Implementation of the proposed Plan would accommodate an increase over existing conditions in the number of residents living in areas subject to sea level rise. The EIR identifies mitigation measures and adaptation strategies that would lessen the impacts associated with sea level rise, but because MTC and ABAG cannot force local implementing agencies to adopt relevant mitigation measures, and because there may be instances in which site-specific or project-specific conditions preclude the reduction of all project impacts to less than significant levels, this impact remains significant and unavoidable for all the proposed Plan and all alternatives. See Master Response E for more information on sea level rise. See Master Responses A.1, A.2, and A.3 regarding local control over land use planning and CEQA streamlining. Your support for Alternative 5 is acknowledged.

D2-I Kasey Saeturn

- D2-I1: The comment does not raise environmental issues requiring a response under CEQA. That said, as transit vehicles are replaced over the life of the Plan, they will likely be succeeded by increasingly GHG-efficient vehicles (e.g. many local transit agencies are currently converting from older diesel buses to hybrid or natural gas buses). The proposed Plan allocates \$15 billion to maintain and sustain the existing system which includes money to fully fund timely transit vehicle replacement; see Chapter 1.2 of the Draft EIR for more details.

D2-J Jill Ratner

- D2-J1: Please see Chapter 2.1 of the Draft EIR, which analyzes transit capacity exceedance under Impact 2.1-5, and which found that the proposed Plan would have no adverse impact at a regional level. However, it is acknowledged there may be instances of local crowding not captured in the analysis. See Mater response A.3 regarding the level of specificity of this program EIR. Refer to the response D2-D1 regarding the Draft Plan's investments in public transit and the determination of no adverse impacts as a result of regional transit utilization in any EIR alternative. Refer to the response A22-5 regarding the Draft EIR's focus on regional, rather than localized, transit capacity constraints. Page 2.1-36 of the Draft EIR specifies the rationale for the 80 percent utilization threshold, as this would represent the point where it would be difficult for transit passengers across the region to find a seat.
- D2-J2: Your request to incorporate measures as proposed in Alternative 5, they will be considered by decision-makers as part of the EIR certification process and action on the proposed Plan. Without more specific information provided on what aspect of the assumptions pertaining to cross-commuting, end-commuting, and the transportation impacts of additional ridership should be reassessed, this response cannot provide a specific answer to the comment.

D2-K Evelyn Stivers

- D2-K1: The comment largely concerns funding for transportation and affordable housing, which is not an environmental issue under CEQA. See Master Response D.2 for information

regarding the connection between high-density housing near transit and reduced greenhouse gas emissions.

D2-L Peter Singleton

D2-L1: See Master Response F for more information regarding displacement.

D2-L2: D2-L2: The Draft Plan increases daily transit seat-miles by 27 percent, including a 10 percent increase in local bus daily seat-miles and 20 percent increase in express bus daily seat-miles, as shown on page 2.1-27 of the Draft EIR. While the Draft Plan does include substantial investments into new rail lines across the region, it also provides funding for major bus improvements through new bus rapid transit lines on the most heavily-used existing Muni, AC Transit, and VTA bus routes. These investments will improve service frequencies for existing and new riders, and many will provide service to low-income Communities of Concern.

D2-M Public Speaker

D2-M1: The revenue estimates for the proposed Plan includes \$14 billion in “anticipated/unspecified” revenues. The inclusion of “Anticipated” revenues in the financially constrained plan strikes a balance between the past practice of only including specific revenue sources currently in existence or statutorily authorized, and the more flexible federal requirement of revenues that are “reasonably expected to be available” within the plan period. MTC performed a retrospective analysis of projections for predecessor long-range plans, including a review of unexpected revenues that had come to the region but had not been anticipated or included in these projections. Over a 15-year analysis period, the San Francisco Bay Area received an annualized amount of roughly \$400 million (in 2011 dollars) from these “unanticipated” fund sources. These revenue sources include Traffic Congestion Relief Plan, Proposition 42, nonformula federal funds, Proposition 1B, and American Recovery and Reinvestment Act funding. For each fund source, only the amount distributed to the Bay Area was included. Based on this retrospective analysis, MTC believes it is reasonable to anticipate that additional revenues will become available to the region over the course of the Plan Bay Area period.

D2-M2: See Master Response B.1 regarding population projections, including a discussion of DOF and ABAG data.

D2-M3: To the extent that historic urbanization patterns have influenced the built and natural environment in a manner relevant to the environmental analysis contained in this EIR, this issue has been discussed. For more information on displacement, please refer to Master Response F.

D2-N Jim Bitter

D2-N1: The comment does not raise environmental issues requiring a response under CEQA. For information regarding local control over land use planning, see Master Response A.1.

D2-O Azibuike Akaba

D2-O1: See Master Response F for more information regarding displacement.

D2-O2: MTC and ABAG appreciate your support for the EIR's consideration and analysis of diesel in the air quality section.

D2-P Rachel Hallowgrass

D2-P1: Your opposition to the No Project alternative and the other plan alternatives is acknowledged.

PUBLIC HEARING ON DRAFT EIR – SAN JOSE (4/17/2013)

D3-A Ivana Yueng

D3-A1: See response A19-1. This EIR evaluates Plan Bay Area as a single, regional plan and assesses its impacts at a regional level across all nine counties, which is consistent with CEQA provisions regarding program EIRs. The individual projects that may result from the Plan's transportation improvements and land use development will require their own individual environmental analyses consistent with CEQA. A county-level evaluation of the proposed Plan and its impacts would be at a greater level of detail than is appropriate at this point in the planning process. Impacts have been assessed with the proper level of detail at a regional level and a conceptual localized level.

County level information has been provided in the EIR when feasible solely for informational purposes. Please see Master Response A.3 regarding the level of specificity in the EIR.

D3-B Ed Mason

D3-B1: The Plan states that as the population ages, some people will downsize and seek better access to services which could increase demand for multifamily housing in transit served locations. For example, according to the University of Southern California Population Dynamics Research Group's The 2010 Census Benchmark for California's Growing and Changing Population (2011), people aged 55 and over are more likely to prioritize public transportation walking, access to shops and services and multifamily housing than do other age groups. Research by the Urban Land Institute and others also suggests increased demand for multifamily housing in part due to an aging population.

D3-B2: Corporate shuttle buses have recently become an important part of the regional transportation system. As these vehicles are not open to the general public, they are not included in the public transit mode analyzed as part of Plan Bay Area; instead, they are viewed as private vehicles using the regional highway system (similar to passenger and freight vehicles). Furthermore, as they are funded by private entities rather than the federal, state, and local funding sources that compose the Draft Plan Bay Area, it cannot be assumed that these vehicles continue to operate in the future. Therefore, it would be inadvisable for the

Draft EIR to include the congestion relief and air quality benefits of these corporate shuttles given that they are dependent on the continued support of individual corporations over the next three decades.

The Draft Plan does include a substantial increase in public shuttle buses as a key element of the enhancing the region's public transit system (refer to RTP ID #22268). In particular, the present-day network of public shuttle buses connecting to Caltrain stations is proposed to be expanded to better connect transit nodes with major employment, retail, and residential areas in San Mateo County. These vehicles help to address existing issues related to the "last mile" problem, where major activity sites are not located proximate to a high-capacity transit station but instead require a short-distance (generally between 1-3 miles) transit connection.

D3-B3: See Master Response E for more information regarding sea level rise.

D3-B4: See responses D3-B1 and D3-B2.

D3-C Michael Ludwig

D3-C1: The list of transportation projects in the proposed Plan is in Appendix C of the Draft EIR. These projects were selected by MTC in May 2012; please refer to the Draft Transportation Investment Strategy on the OneBayArea website at <http://onebayarea.org/related-materials/Document-Archive.html>

D3-D Don Conners

D3-D1: The comment does not raise environmental issues that require a response under CEQA.

D3-E Hilda Lafebre

D3-E1: In addition to the proposed Plan, the EIR evaluates four alternatives, one of which is the No Project alternative.

D3-F Jim Bitter

D3-F1: The comment does not raise environmental issues that require a response under CEQA. Concerning the adequacy of the public outreach process, MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

CLARRISSA CABANSAGAN

That's okay. Hi. My name is Clarrisa Cabansagan. I am a transportation advocate at Transform. I am a long-time Alameda County resident. I went to Cal. I grew up in San Francisco and Daly City, and I want to say that I agree with what the Plan Bay Area is trying to do; trying to get us all to drive a little less and preserve our beautiful Bay Area. I went to transportation planning school because I realized how much of my life was determined by the choices that decision makers like you will be making in a few months. I'd like to say that I was pleased to see that the Environment, Equity, and Jobs scenario came out as the environmentally superior alternative. And I would like to urge MTC and ABAG to really look at what was modelled in that scenario, that increased transit operations funding, it reduced the scope of the highway network, put more affordable housing in communities where, you know, they weren't being planned for, and also put stronger anti-displacement measures. And I feel that, you know, we have the future of the Bay Area to look at. I feel that as someone who has lived here, who calls this place home, I work really hard to make sure that it works for everyone. So many of the people that I know are tripling -- doubling up in apartments. And that's kind of a testament to see the great need that we have. I'm proud to say that I got here on BART, and I biked from the BART station to here. And I think that that's why it's so important for us to invest in our existing transportation system, and to also improve transit and housing for everyone; not just people that can afford to live the way that they have been for so long. Thank you.

MYESHA WILLIAMS

My name is Myesha Williams, and I am here mainly to support two young activists that -- advocates that I've been working with for years, who are trying to make a way for themselves at this table. I just want to quickly say that I support -- I would urge you to include the measures around transit operation funding and anti-displacement measures that are currently in Alternative 5; the Environment, Equity, and Jobs alternative. Transit is really important to the communities that we come from, and especially to these guys that will be speaking today. Thank you very much.

PAMELA TAPIA

Good evening. My name is Pamela Tapia. I'm a student at the Peralta Colleges. Thank you for the opportunity to speak to you today about the Plan Bay Area. I am here to urge you to modify the proposed Plan to increase the level of funding for transit and for affordable housing included in Alternative 5, and to also adopt the other anti-displacement measures in Alternative 5. Without more investment in affordable housing and other anti-displacement policies, displacement will occur, forcing longer, more expensive and more polluting commutes to low-income residents. In September of 2009, my mother lost her low -- her minimum-wage job. Her factory decided to pack up and move to South Carolina. As a single parent raising two kids, my mom depended on that \$208 to pay the \$700 rent on our apartment on the West Oakland-Emeryville border. She spent most of her check on housing and transportation. She decided to move her family to Central Valley where an apartment was half the price of our former home. But there are no jobs -- at least none that she was qualified to do the work. She had no option. She had to go back to do the same thing she had always been doing. After almost four months of desperate job-hunting, my mother found a job in the Union City's Industrial Park. My mom lives in Manteca, but has to commute to Union City for work. What used to be a 30-minute ride from our apartment near MacArthur BART turned into a 4-hour commute. Since she doesn't have a car, she would have to take the bus from Manteca to Stockton. From Stockton she'll have to take a \$20 Amtrak train to Richmond. From Richmond she would have to pay \$5 to get on BART to Union City. From Union City BART she'll have to catch another bus to her workplace, bringing the total amount to almost \$60 a day, just to travel for work. At a rate of \$8 an hour, working 8-hour shifts, she would make an approximate of \$64 a day. She would spend \$60 on transportation just a day. She literally could not afford to work. To avoid spending so much money traveling, she determined she would have to stop traveling. During weekdays, she would sleep in BART trains, riding the train until the end of the line, getting off and riding back down in the opposite direction; even sleeping on her job's cafeteria or on somebody's couch. I felt awkward writing this and even weirder reading this to you. I'm not asking for your pity. That is not my goal, but these are the facts. This happens. The proposed Plan assumes displacement

will not result in increased rates in commuting from outside Bay Area or cross-commuting between counties. This assumption is not supported by historical trends and does not agree with my own experience. Thank you.

DEVILLA ERVIN

E1-D1

My name is Devilla Ervin. I was born and raised in Oakland. I urge you to adopt the transit operations funding and funding for affordable housing and other anti-displacement measures in Alternative 5.

As a young man looking to live on his own, I am deeply troubled by the threat of displacement in my community and other areas slated as Priority Development Areas. By underestimating the impact of displacement, I feel we are doing a disservice to the entire purpose of the Draft Plan. Displacement needs to be at the forefront of this conversation because you cannot cut down VMT and/or greenhouse gas emissions without dealing with this threat. Living in Oakland, I have known many people who find themselves being forced to leave their homes and communities that hold a sense of history and family to find housing that is less expensive. One example of this is my foster mother. My junior year of high school, she found a place that was affordable, but it was in Sacramento. She was still working in Hayward and was commuting up to five hours a day just to get to and from work. This is what I fear for thousands of other low-income families with the adoption of this proposed Plan in the absence of additional mitigation. By increasing investment in public transportation, affordable housing, and strategies to retain and build businesses that serve the existing community, the Equity, Environment, and Jobs alternative -- or Alternative 5 -- will go a long way towards addressing these concerns and mitigating the impacts of displacement. Without careful, conscious, and deliberate planning, more low-income residents will be pushed out to less-attractive, and more polluted parts of the city, while attracting persons who have not historically found these areas attractive. Plan Bay Area should not add to the list of issues residents already have to deal with. Plan Bay Area should be providing solutions and incorporating the strategies in Alternative 5 that makes it the environmentally-superior alternative, thus leading to a more sustainable and resilient Bay Area. Thanks.

METROPOLITAN TRANSPORTATION COMMISSION
ASSOCIATION OF BAY AREA GOVERNMENTS PUBLIC HEARING
ON THE DRAFT PLAN BAY AREA CONTRA COSTA COUNTY /REPORTER'S TRANSCRIPT OF
PROCEEDINGS

Monday, April 22, 2013

COMMENTS ON DEIR

AVON WILSON:

E2-A1

Chairpersons, Ladies and Gentlemen, my name is Avon Wilson. I have lived at the same residence in Lafayette for 43 years. I am requesting that ABAG and MTC extend the public review time for both the Draft Plan and its Draft EIR. As we know, the plan is 160 pages. The Draft EIR is over 1,300 with many supplementary technical reports. Staff and consultants have been working on the plan for many years. Most recently, your bodies extended release of both documents by three months for fine-tuning, allowing an equivalent amount of time for what could be the most important public review is right and fair, providing parity between the public and those interests cited in the plan as stakeholders. In representative democracy such as ours, the primary stakeholders are the folks who elect the local, state, and state federal representatives, the folks who pay the bills, the public. We elect representatives to govern in our place so that we might do the other tasks necessary to producing a viable country. As follow-up, we are charged and required to review and approve our elect elected representatives' job performance and work products. Properly, a plan of this magnitude should be submitted to the public for a vote. Short of that -- short of that, an extended public review time of these documents is essential. It is self-evident. ABAG and MTC should provide for no less. Thank you.

E2-B1

DANIEL DEBUSSCHERE: Okay. Great. I submitted a question, trying to be positive about the plans, and the EIR and the question was phrased like this: I did a word search on the digital copy of the plan. And I word-searched for BART parking. There was none. This kind of gave me the impression that the plan is slightly slanted to someone's vision on how all the MTC funds should be spent for the next 30, 40 years. Now, I live in Orinda. I live in a 3000-foot home on a half-acre-zoned house. I'm very happy. And when I read in the plan that the reasons you want dense -- multi-density-type of housing is because of the rising population of Asians and Latinos seem to favor this modality. Well, I can assure you, if you gave them the choice of that versus what I have, the answer is simple. The reason that you're going to the dense multi-family, 20-units-per-acre-type of planning as defined in SB 375 is strictly an economic thing. And, quite frankly, it's driven by development efforts and development people who were in the Speaker of the House's office when 375 was drafted. So that's the special interest stakeholder. Now, I think you need to broaden the plan. You need to put quality of life in what it is you're doing. This stack-and-pack is only serving one interest. And it's not serving your clients and it's not serving us who live in the communities who have to accommodate these things. Thank you very much.

KATHLEEN JENKINS: Hi. Good evening, Ladies and Gentlemen. My name is Kathleen Jenkins. I live in Orinda and have been a proud member of Orinda for 17 years. I'm one of these people that are firm believers in free market economy. What does this plan presume? There is a plan for stack-and-pack housing in Orinda. If there was an interest, wouldn't these already be built? Because they're not already there, this means there's no market demand for this type of housing. If there's no demand, this means people don't want the type of housing you are suggesting. And that means that these will need to be heavily subsidized with public funding. If you put the stack-and-pack housing close to our Orinda public transportation, this suggests that you'll need to replace existing land use, which leads us to the need for eminent domain. Why would any city allow others to take the power to decide land use away from other cities and citizens who support the local community and schools and put it in the planned hands of others who don't live there and don't support the community? Furthermore, your plan and Draft EIR concedes

E1-C1

that past decision by residents and current preference in survey responses indicate that 60 to 70 percent of all new homes are requested to be stack-and-pack. Where is the empirical evidence that people's preferences will dramatically shift towards wanting to live in pack-and-stack housing. Thank you for your time.

HEATHER PRUETT: My name is Heather Pruett and I live in Orinda; been a resident there for about 13 years, and I have two points to make. They're both fairly concise. The first has already made, but I want to make it again because it's very important. A very short time ago, in late March, ABAG released the Bay Area Plan, Plan Bay Area, it's development plans. One comment people may be aware of, it's 160

E2-D1 pages long, and along with it comes the 1300-page Environmental Impact Report. ABAG putting a deadline for concerned citizens to read all of that and respond by May 16th is completely impossible; it's unreasonable, and I am requesting that the deadline be extended by an additional 90 days. That's the first

E2-D2 point. Second point I want to make is that ABAG really could not be forcing an increase in housing supply and pushing the unwanted stack housing, especially in small communities like Orinda, at a worse time. It doesn't make any sense to me when we've had over three-and-a-half million people leave this state and go to other states due to high taxes, due to high unemployment, which has not gotten any better. And, meanwhile, I work full-time at a very large utility company, and I'm starting to see a lot of people my approximate age group starting to retire. And where I'm going with this is we all know a lot of the baby boomers are starting to retire. A lot of people are starting to retire. In particular, there's about 78 million born between 1946 and 1961 who are going to be retiring in this area. They're going to be leaving, a lot of them are. We've seen the trend. We don't need more housing. This is the worst possible time to be adding in mass development stack housing when people are leaving, and that trend is clearly going to continue.

JOHN DOE: I oppose Plan Bay Area, including but not limited to, all low income, high density stack-and-pack housing projects. Organizations such as OrindaWatch.org and Pleasant Hill Citizens for Responsible Growth have identified a plethora of community population growth, overcrowding, crime, police, educational, land use, vehicle use, tax, funding, and environmental issues, which are not

E2-E1 adequately addressed by Plan Bay Area. So I have several questions related to this, and one of them was identified by Evelyn, the first speaker, and that is, why is Plan Bay Area, a plan of such great magnitude, not being presented to the citizens of the Bay Area, including Contra Costa County, for their vote.

Governor Brown put on all those tax increases in the last election on the ballot. Why can't this, if it is such a great plan, be put on the ballot for the citizens to decide? I realize it's not required by law, but if all of you believe in this plan as you specify, why can't you put it on the ballot for us. Plan Bay Area requires

E2-E2 80 percent of all new houses to be stack-and-pack. Where is empirical peer-reviewed evidence that percent of Bay Area citizens want to live in high density stack-and-pack housing. SB 375 requires unfunded mandates on counties and cities to be identified. Where is the analysis in the plan and the Draft EIR that would cost the continues and cities of these unfounded mandates and the impact of this cost.

E2-E3 Why is there zero funding in Plan Bay Area for more schools, police, and fire protection needed for the population growth identified in the plan. Where in Plan Bay Area is the analysis of the impact of low-

E2-E4 income, high-density stack-and-pack housing on the property values of surrounding properties and the crime rates of applicable Bay Area communities. Since the plan impacts all nine Bay Area counties and

E2-E5 all 101 cities of the Bay Area, why doesn't Plan Bay Area include city by city as well county by county economic and environmental impact analysis. Thank you.

RUSTY SNOW:

E2-F1 Hello. I am Rusty Snow. I'm a member of the non-partisan group called Orinda Watch. Last month, Orinda Watch had a very large town hall meeting with over 325 people. From that meeting, our surveys indicated the majority of citizens opposed losing local control of their small towns. It appears the majority of citizens opposed the Plan Bay Area and its concepts of regionalism. Should policies like the Plan Bay Area be decided by the citizens and through Democratic process or should the fate of its existence be decided by an outside agency. Would the administrators of the Plan Bay Area do the right thing and allow

E2-F2 the Plan Bay Area to be decided by popular vote. No. 2, I agree with the other people that the plan and the EIR should be extended to allow people to have time to review it and to make comments. Our concern with the Plan Bay Area is that we do not believe in many cases that is based upon logical assumptions or accurate facts. Concerning this, I have the following questions: What right does ABAG have to mandate that the stack-and-pack housing be built if this ruins the character of our small towns. The plan calls for housing near mass transit. Why would anyone want to live next to BART. Have you ever tried to take a nap next to a BART train. That's kind of a loose comment, maybe a little simplistic. But I think that's a quality of life, is being able to take a nap during the day, etc., and BART is extremely noisy and not good for living next to it. Wouldn't it make more sense for businesses to be located next to mass transit like BART and housing located away from BART. The Plan Bay Area poses the exact opposite of this. Would stack-and-pack housing have an impact on adjacent property values? Has this been carefully analyzed. If the joining properties are negatively affected how are the property owners going to be compensated. Are there not laws that address the responsibility on governments if their actions cause property values to drop?

PETER SINGLETON:

E2-G1 Thank you, Madam Chair. Peter Singleton. While this isn't a hearing on the Draft EIR, I wanted to point out that one of the greatest deficiencies in the environmental review process is a sham process with a predetermining conclusion. And, with that in mind, I'd like to share with the public here where the Plan Bay Area exactly came from. The plan itself on page 3 says that it comes from SB 375 and that the plan's policies elements were developed by consultation and through the input of the public, the Bay Area citizens. This is not entirely correct. Plan Bay Area, in all essential policy elements, came from the Compact for a Sustainable Bay Area that was released July 29th, 1999, the Draft Plan. That's years ago by the Bay Area Alliance for Sustainable Development. And the Bay Area Alliance was a collection -- a coalition of very powerful corporate interests, nongovernment organizations, and it was run by ABAG and MTC, but each policy element of Plan Bay Area; so the need to live in high-density housing, the need to take transit, the requirement that all cities be demographically even and that we need to move toward regional governance. Those were all part of the draft compact. The only thing that's missing from the draft compact is anything about greenhouse gas emissions or climate change because that rationale had not been discovered. So it's not entirely correct for the Plan to say on page 3 that it comes from SB 375. Actually, SB 375 comes from the compact. And, further, the plan did not -- the policy elements in the plan did not come from the public whatsoever. Thank you.

TERRY THOMPSON:

E2-H1 My name is Terry Thompson from unincorporated Alamo. This is all about central planning; didn't work in the Soviet Union and it's not going to work here. Julie, you said ABAG consists or composed of elected officials. I didn't vote for you, I didn't vote for any of the ladies up here. There are three kind of government. We have city government, we have county government, we have state government. There's no such thing as regional government. Regional government is non-existent. It's illegitimate. If you want public input, and you say that's why we're here tonight, there's one way to get public input. That's to put this for a vote. You have a 1,300 page EIR, which almost guarantees no one is going to read it. Maybe that was the design. So, as I recall, I went to a meeting down in Oakland and you had a big screen up and you had a bunch of options and various options of what you could do, what you were deciding on. And it seemed to me there was one option we can choose to be hung, another we could have a firing squad, or we could lethal injection, or maybe death by a thousand cuts. I think that's where we are now. There was one option, though, that I did like. My personal favorite was called "No Project." I said, you know, we want local control. And my wife just told me, "You mean, we don't want loco control." So I'd urge all of my friends here in the audience to demand of their cities, their towns, Get out of ABAG. We're doing this now over in Danville. They're going to agendize it. Corte Madera has already done this. I recommend that all of you get out your pitchforks and your torches and go to your town councils and get us out of ABAG.

SUSAN CALLISTER:

Good evening. My name is Susan Callister. I live in Lafayette. I'm a member of the Happy Valley Improvement Association board and part of the Lafayette Homeowners Council. I was a little bit concerned at the beginning of this evening when someone up there said that this particular thing was going to be going through in July. I do remember smart growth about nine or ten years ago, attending a meeting, and thinking, "Oh, God, I hope this doesn't go through," and it didn't. So I think a lot of the people that were up there this evening that asked you to sort of stand up to the plate and put this up for a vote -- and I'm sure there's money to be found in some of the grant money that's dangled around the communities that are designated PTAs, and you can you use that for a vote in Contra Costa County. The EIR and your Plan have some unrealistic forecasts for jobs, households and, you know, you refuse any kind of independent analysis. You know, I believe there's global warming. I believe we need to have housing for everybody in our community and help those that need help, but I don't believe that you're the decider of that. We are. Our communities are. Our downtown plan, our general plan, not this one Bay Area thing. So I urge you to listen to some of the people that spoke tonight and put it up for a vote of the people. And then a second thing on the PTAs, at least for our community, it seems as though our staff gets grant money dangled at them. So last year we had our street torn up for almost a year to get pink sidewalks and some trees torn down, and I don't know why we did it. It did put some people to work, but not for very long, and the outcome wasn't good. So once again, I ask that you stand up and you put it to a vote of the people. Thank you.

E2-I1

CHET MARTINE: My name is Chet Martine. I reside in Orinda. I've been there 12 years. My wife's been there over 45. I'm a retired patent attorney. I volunteered in the 8th grade middle school in San Francisco for a few years. I was a trustee for two years for a local deceased family, and I'm now a student of ABAG. My concern is the large unreimbursed cost impact on cities such as Orinda, the impact of the RHNA and housing element process on cities. This impact was increased by a March 30th, 2005 decision of the commission on State mandates. Per that decision, cities will no longer be reimbursed for their costs working on the RHNA and housing element process. In a service-matters issue -- this is on the website. You can look at it: Service matters. There's tens and tens. In that issue in July/August 2005, ABAG commented on that decision and said, quote, "Without reimbursement from the state, ABAG and other COGs" -- and that means cities such as Orinda -- "are simply not in a financial position to perform the next RHNA process." A question for you then is: What has ABAG done or will it do up-front before a city infill is built in their city? To assist the cities' abilities to work on the RHNA and housing element tasks, there was no mention of any such financial assistance in service matter issues after 2005. For example, will ABAG stop requiring cities to pay a membership fee to ABAG to partly offset this decision? For clarification, I do not mean the so-called incentives that could be paid to a city after completion of low-income housing. Lastly, I reserve the right to file with ABAG/MTC other comments in writing and without limit on the time I take to write them and without a limit on the number of pages.

E2-J1

E2-J2

E2-J3

Thank you. That's my protest against limiting to two minutes. And concerning air pollution, the mitigation standard in best practices was to locate balconies away from the polluting highway. That's crazy.

LINDA DELEHUNT: Hi. It's getting late. We've all heard so many wonderful comments. I can't believe the passion in this room, so I'm not going to belabor my particular points too because so much has been said. But I would just like to point out that it does appear that the concerns voiced here tonight point to a real process gone awry, and I believe you people can perhaps correct it, but I do think we are hearing about a process that's really gone awry. We are talking about a 1300-page document, which is about to be implemented before it has been adequately shared by our citizenry. And again, that points to a process that's really gone awry. The process itself needs to be revisited. I urge you, first ask citizens if they want to be a part of ABAG. That's the first question. Once you have confirmation, establish citizens oversight groups and then do individualized plans based on the unique individual characteristics of the communities

E2-K1

involved. If we don't do that, our Bay Area will ultimately become faceless, and that is not something that I think any of us want to see. So please, revisit the process. Thank you for listening.

METROPOLITAN TRANSPORTATION COMMISSION
ASSOCIATION OF BAY AREA GOVERNMENTS

PUBLIC HEARING ON THE DRAFT PLAN BAY AREA MARIN COUNTY – **COMMENTS ON THE DEIR**

REPORTER'S
Monday, April 29, 2013
Marin Center
--oOo--

ATTENDEES
PAT EKLUND, Mayor of City of Novato
STEVE KINSEY, Marin County Board of Supervisors
KATIE PRICE, Marin County Board of Supervisors, District 2
--oOo--

P R O C E E D I N G S

RONNIE TEYSSIER

Hi. I am Ronnie Teyssier. I am a resident of Tamalpais Valley. I will be short and succinct. There are a lot of people who want to have their voices heard tonight. But I urge you to remove TamAlmonte from the Highway 101 Corridor Priority Development of the Bay Area. Mandating development as planned will cause irrevocable damage to the environment. And it will also subject the most vulnerable of our citizens to extreme environmental impacts, such as sea level rise, water deficit, toxic air contaminants, unacceptable traffic congestion. Again, please. I really urge you to remove TamAlmonte from the Highway 101 Corridor Priority Development of the Bay Area. Thank you much.

E3-A1

CRAIG THOMAS YATES

Craig Thomas Yates, City of San Rafael. I believe that the TODs that are going to be developed for this development should be a hundred percent accessible. And the fact that it's also the wetlands should be taken into consideration for the conditions that are expressed in the Draft EIR. And thank you.

E3-B1

JESSE SHEPHERD

Well, good evening, Board of Supervisors. My name is Jesse Shepherd. I am a resident of Santa Rosa. And I am here affiliated with Transportation Equity with Marin Grassroots. And I'm here actually tonight because I support the EEJ -- That's the Environment, Equity and Jobs initiative because compared to other services, it pretty much invests an additional 8 billion dollars in increased transit service, which would be tailored to fit our more equitable housing distribution plan. One of the things that concerns me is that I've been a transit user for -- a public transit user for my entire life. I grew up in Marin; lived in Strawberry for the first 20 years of my life. And the problem is, we don't have adequate public transportation serviced by Marin Transit, serviced by Golden Gate Transit, at night. We have pedestrians that can't get to and from the canal who have service jobs at Larkspur Landing, who have to walk under dangerous walkways. And we have people that can't get home. I know personally I have had to spend probably hundreds -- maybe as much as maybe a thousand dollars in the last two or three years just on cab fare to get home because, well, there were not public transit routes running at 11 o'clock, maybe 10:30 -- 11 o'clock, 12 o'clock at night that were adequate. And it is really important for somebody like me because I'm legally blind in one eye. So I depend on accurate, solid, firm public transit. And I feel that we need more of that in Marin County. So if that means that Marin Transit has to help, you know, get more funding for that, then we need to work on that. And that's hopefully what I hope that you guys would take into consideration. Thank you.

E3-C1

ERICKA ERICKSON

My name is Ericka Erickson, and I live in San Rafael. And I am -- I am affiliated with Marin Grassroots. I am also a County Planning Commissioner. I would like to ask everybody that's here to support the Equity, Environmental Jobs scenario of the Plan Bay Area to please raise their hands. Basically for the ones that don't know, the environment and jobs -- environmental -- Equity, Environment and Jobs scenario was proposed by a network of health -- public health, affordable housing, and other grassroots groups back in 2011, when this Plan Bay Area was being proposed. And basically this scenario, it was considered the environmentally superior scenario from all the scenarios proposed during this process. And basically the -- by adopting the strongest aspects of this environmental -- Equity, Environment, and Jobs scenario in the Plan -- the Final Plan Bay Area, it would support transit operating budgets by about -- increased by about 5 percent. As we heard from Jesse, it is very needed. We

E3-D1

know that this scenario will result in the greatest reduction of greenhouse gas emissions. That's the primary goal of Senate Bill 375. It will create the strongest shift from cars to transit, walking, biking, and other alternative means of transportation. We will keep a hundred percent of the new development; would keep the current urban footprint; and allocate 12 fewer residents living in homes that we will be at risk of flooding sea level rise by 2050. I know that a lot of people in Marin County -- We are all concerned about sea level rising. So that option of the Plan will be the best to address sea level rising. The 30,000 fewer residents will be subject to sea level flooding by 2050, if we adopt that option. So I want you to urge all the decision makers to really consider the strongest aspects of this scenario in the Final Plan Bay Area. Thank you.

And also have more incentives for affordable housing. I am -- as we know, we have a great need for affordable housing and also diversity of options of housing in Marin and the Bay Area. And that would support -- This option would support that. So -- But my main -- biggest concern, in terms of the Equity, Environment and Jobs scenario and the Plan Bay Area, and I want to urge you and all the decision makers to support this scenario and the aspect of it is regarding climate change.

CATHY CORTEZ

E3-E1

My name is Cathy Cortez. I'm a member of Marin Action Coalition for Equity and The National Low Income Housing Coalition. I am from Tiburon, California, and I support Equity, Environment, and Jobs. Marin County needs affordable housing. There have been opponents of the regional housing needs allocation and the population growth predictions that say the numbers are too high. But even as it stands today, the need for affordable housing is very real. One indicator that is reflective of that need is the fact that there are nearly 8,000 households on the Housing Choice Voucher Section 8 waiting list. That number -- That list has been closed since October of 2008. And even then it was only open for a one-week period of time. Marin needs affordable housing with or without population growth. The need is very real as it stands today. Thank you.

LOIS RIDDICK

E3-F1

Good evening. My name is Lois Riddick, and I'm -- I live in Marin City -- A Marin City resident, of course. And I've been advocating for Marin City, as well as throughout the county. And my concern is that -- I do support the Equity, Environment and Jobs scenario. It invests an additional 8 billion in increased transit service. And why transit service is so important to me personally, and to many people that make contact with me by e-mail or in person, I find that there are hillsides that are not accessible through the transit services. And I've been going to meetings. I've been writing letters and been advocating as a part of the housing and transportation committee, also serving as a commissioner on the Division on Aging. And so it is important that we look at the bigger picture. And I depend totally on transportation. I am disabled, and I am a senior. So I am coming from two points. I want you to consider that there is -- is that you see this commercial on TV; less and more. We need more transportation for seniors. We need this transportation because it allows the seniors across the county that are lonely to get more involved. There are seniors that are still volunteering. There are seniors that are getting older; perhaps would like to stop driving. But if we don't have the services accessible to those seniors, they will not be able to have their lives fulfilled in the way that is needed. Thank you.

LINDA RAMES

E3-G1

I am Linda Rames, and I am actually here to comment on the Draft EIR. It is full of inaccuracies and inadequacies. The most striking thing about it, however, is the total disregard for the residents of Marin now and those to come. One document --

E3-G2

Excuse me. This document has no problem building on floodplains, and there are no answers or mitigation for that.

E3-G3

It has no problem with the lack of water. The only mitigation for that is conservation; something Marin County is very good at already. In fact, we are famous for it. The police, fire, and schools that will have to be built -- They will have to be built, but they don't give you any idea how that will happen; who is going to pay for it. Things like that.

E3-G4

These are just a couple of examples of a failed document, which also makes false predictions of population growth and employment opportunities in the future. In addition, there is no distinction between planned and potential development areas. They should clearly be spelled out in the Plan. Thank you.

LUKE TEYSSIER

E3-H1

My name is Luke Teyssier. I am a resident of Tam Valley. I am concerned about the environment, the community, the place we live. I have small children. I am concerned about water, the quality of life, the quality of air, and the quality of living. I feel that equity, environment, jobs, schools, housing, and a clean, safe place to live for everyone is extremely important, which is why I urge you, urgently, to remove us -- Marin County -- from Plan Bay Area. I urge you to remove us from the Priority Development Area. I urge you to forbid ABAG and MTC to exert control in our community. I would like to remind you -- to say it plainly -- I am opposed to Plan Bay Area. However, if you insist, I support the "no-action plan." Let us have local control over our community. We've done a pretty good job in our communities for the last 50 to 100 years of planning what needs to be done, which is why people want to live here. Let us have that local control. Now, I've heard advocates say, "Let's have ABAG because there will be all this money." Where does the money come from? It comes from us. What happens? The money goes to a big organization over there. They take their cut. They have their offices. They have their bureaucracy. They have their big show-and-tell sessions. Has anybody ever seen a Jimmy Stewart movie, the western, where the big fancy suits from New York come in, and Jimmy

Stewart sits there and says, "Now just wait a minute. Wait a minute. I know that's not right"? Every single time I have a meeting that involves ABAG, I have the same sense. Supervisor Kinsey, during the Citizen Marin Meeting, I noticed that you showed up in time for the news cameras, sided with the folks in favor of Plan Bay Area, and then removed yourself before the discussion happened inside. I submit that this is extremely problematic for two different reasons: The first one is, it appears to the casual observer that you have already made a decision, regardless of community input. Secondly -- I submit that by refusing, after you were invited cordially and multiple times by multiple people to enter and remain in the meeting, I submit, sir, that you have had many opportunities to receive local community input and were simply not interested.

PETER HENSEL

E3-I1 Peter Hensel, from Corte Madera. I am very interested in water. Where are the water for 2.1 million new residents by 2040 going to come from? I think there is a serious disconnect between the Plan Bay Area and water supply, and it troubles me greatly because in 2001, Governor Gray Davis signed a couple of bills -- SB 610, and SB 221. They were companion bills. They require that big developers submit a Water Supply Assessment Plan before going forward. Now, there is a threshold of 500 units, below which you don't have to submit a Water Supply Assessment Plan. But considering the fact that Plan Bay Area is -- I think it's planning for 600,000 -- Let me -- Wait a minute. 600,000 -- 634,000 housing units by 2035. I mean, that's an incredible amount. That's 1,268 times 500. So I would say that Plan Bay Area is not exempt from submitting a Water Supply Assessment Plan. It is just absolutely not reasonable considering the fact that in California we are fighting over water all the time. Now, climate change is a reality. We all know that. We -- Even the most diverse oppositional foes here agree on climate change. But along with climate change, there comes a variability in weather. I mean, some places have super storms; other places have droughts. It is getting very difficult to forecast the weather. And this makes it also very more problematical when you start planning for so many people. I recently read something that the farmers in the Central Valley this year will be getting 20 percent of their contract water supply on account of a low snow pack in the Sierras. I think in the three months from January to March, we got 52 percent of what we normally get. I mean, this is very serious stuff. And so there's a saying in the water industry -- It's kind of an ironic saying. They use this term, "paper water." What it means is, water that is planned for that may belong to somebody else in the system, or that may be coming according to future planning, some hoops that people are going to jump through -- Okay. But one thing I want to say is that we shouldn't be banking on paper water.

LINDA PFEIFER

My name is Linda Pfeifer. I'm on the Sausalito City Council, and I would like to comment on the Draft EIR and the process of -- which I consider flawed -- for community outreach. Plan Bay Area represents the single largest plan for high-density development perhaps in the history of Marin, and yet most residents know nothing about it. The lack of transparency for Plan Bay Area has, in my opinion, been pretty abysmal. Many questions exist regarding high-density development plans in so many

E3-J1 gray areas that I am not sure whether to call this Plan Bay Area or Plan Gray Area. Gray areas exist regarding sufficient water supply; the lack of a water assessment plan; endangered, threatened species' habitat, air quality, and traffic congestion.

E3-J2 California Code of Regulations, Title 14, Section 15065(a1) states that a project will have a significant effect on the environment if it substantially reduces the number or restricts the range of endangered, rare, or threatened species. One Priority Development Areas borders the Golden Gate National Recreation Area, and in the middle of the Pacific fly-away where hundreds of migratory bird species, home to 38 rare or special status plant species; nine federally endangered, one federally threatened, 13 federal species of concerns. It is the home of the endangered Mission blue butterfly, and California red-legged frog. Other PDAs are in environmentally sensitive areas prone to rising sea levels, in the middle of fragile marsh and wetlands ecosystems or landfill.

E3-J3 I have three core requests: Please delay the May deadline for the public comment on the Draft EIR; please, ABAG, provide resources at the local, individual city level to hold public hearings in individual cities to fully inform the residents, who still really know nothing about this high-density plan because the people of Marin deserve transparency; not Plan Gray Area. Thank you.

E3-J4 please explore other options beyond high-density development to reduce co2, carbon, such as tele-commuting;

ROBERT BUNDY

E3-K1 Bob Bundy, Corte Madera. I am on the Corte Madera Flood Board. And we've spent a lot of time locally dealing with our infrastructure and the ability to be more resilient and withstand flooding, heavy rainfall, and high tides. One of the concerns that I've got is that the Plan doesn't really take into consideration sea level rise. And while I applaud the goals of trying to reduce co2 because that's what's driving climate change and sea level rise, we really need to look at how this is going to impact some of these development areas and some of the infrastructure, as far as the roads and transportation. The development is going to have to be hardened and protected in a way to prevent sea level rise from impacting it, and also to not create an island where the highways or transportation corridors are not going to allow anybody to get to those islands. FEMA is about to come out with new flood maps, and even FEMA is not really taking into consideration sea level rise in its full extent. So I think that that -- I know it's being thought about in relationship to the Plan, but I think it really needs to be addressed to a much greater extent to really look at what the total cost of some of these would be, and whether some of the locations for priority development really make sense. Thank you.

LIZ SPECHT

I am Liz Specht. I've lived in Mill Valley for 37 years. 23 years ago, I co-founded a non-profit, El Porvenir, which works with people in Nicaragua to put in clean water projects. It's the water that I'm concerned about. Even now, MMWD is asking us to conserve. If there are thousands and thousands more people living in our county, we're really going to have to think: Where does the water come from to give everybody who is thirsty a drink of cold water? We're going to have the problem that Nicaragua has. And if you're thinking that desal is the answer, think again because that would be counterproductive. Greenhouse gases are what we're trying to diminish by this Plan, but what's going to happen if there is a desal plan? It's going to add even more greenhouse gases to our air, and all of us are going to be enclosed in an even hotter bubble than we are now.

Other Infrastructure Needs: Water, etc. Will be counterproductive if a desal plant is needed

JOHN PALMER

Hi. John Palmer from Mill Valley. A couple of things. First of all, I agree with the speaker who came and said this is happening way too quickly. I'm not going to repeat what he said. I am just going to say, he is absolutely right. This is happening way too quickly. Not enough people are aware of it. Not enough people are aware of the implications of it. We really need to take the time to do it right.

The second thing is that a lot of Plan Bay Area is based on what I would call untested or unchallenged precepts. For example, the concept that high-density housing along an urban corridor will reduce greenhouse gases, that's just taken as a given. There's many, many, many similar precepts in this Plan which are really unchallenged. And I would like to see a really thoughtful challenge come forward. For example, that one, that high-density housing along transportation corridors will reduce greenhouse gas. It is obvious to all of us who live here, that if the transportation corridors become more clogged, it will have the exact opposite effect of not decreasing greenhouse gases, but increasing them.

If you really want to decrease greenhouse gases, the simplest possible way to do it is to increase public transit. I have a lot of sympathy for the people who stood up here and said they can't get around, they can't get through the canal, they can't get to their jobs. Every time we turn around, they're cutting, you know, public transit. So if you guys really care about decreasing greenhouse gases, then you should lobby very hard for increased public transit. That benefits everyone. And the only thing -- other thing I would like to say is that when the Plan Bay Area came out, there was an article in the Wall Street Journal. It was very telling; that what the Wall Street Journal said -- The headline of the article was, "California Declares War on the Suburbs." There's a lot of people here who believe that; that this is a centrally-planned, non-particularly -- not particularly well-thought-out way for people who have an entirely different set of benefits to be gained from it imposed on smaller communities that really don't have the power to resist. And I think that if you really take the time to get this right, you'll find that there is a way to empower the small communities to build more housing in a way that won't increase greenhouse gases. Thank you.

GUY MEYER

Hello. I am Guy Meyer. I'm a resident of San Rafael and of Marin County for the last 38 years. Sustainability starts in the present with existing communities, and I believe that sustainability is completely entwined with the essence of what democracy is. If you want to build a sustainable civilization from the ground, the people have to be completely connected to the process of decision making that affects them. Increasing density, increasing population, gradually -- and I'm old enough to see it. Maybe some young people haven't seen it -- lowers the quality of life. That's my opinion. California -- Excuse me. I believe that California needs a moratorium on all large or grand-scale developments. It's been the heritage, shall we say, of California since the 1960s. There is a book in the Civic Center I saw 25 years ago called, "The Destruction of the Golden State," written in 1967. The story has never ended. The story has never been challenged, and it seems to me that this process is giving a green light -- it is giving a jet-pack to the developers who are just hungry. It is a fantastic opportunity for them and not for the people of California and the Bay Area.

Fresh water. I can't believe how we take this for granted in California. I was trying to look for the details or something in the computer to see. I know that in 2006, a grand jury was convened in Marin County and wrote a report about our fragile water supply. Back in the 1980s, we coaxed the population to start getting water from the Russian River, ending our own self-reliance on our own water. That Russian River water may be taken away from us at any given time with more drought. How do you take care of your existing community? What is your oath of office to your residents that have voted you in, as opposed to the people who may want to move here someday, and God bless them wherever they are? The problem of taking care of the people where they are might help them where they are too. Locating people near highways is directly putting people in harm's way; exhaust, particulate matter. There's been studies -- major studies that have shown that. Marin County has pretty favorable weather conditions; may not be as bad as Fremont or other places, but still, it's not good. California needs a new vision of local independence and strength gained from local manufacturing; things that we've completely lost. Anyways-- dependence on the building industry is not sustainable.

RICHARD HALL

E3-Q1 Thank you. I am Richard Hall. I live in San Rafael. Supervisors Kinsey, Rice, and Mayor Eklund. Thank you for having this time for us to speak. Plan Bay Area is supposed to reduce CO2 emissions. It is one of its primary goals. However, the Plan is questionable based on assumptions that are flawed, and it is actually more likely to increase co2 emissions. It's also likely to contribute to

E3-Q2 101 gridlock, serves a subsidization program for transit and housing that will needlessly tax Marin residents. Plan Bay Area claims it will reduce the region's greenhouse gas emissions by 15 percent. But the Plan itself admits that if nothing is done,

E3-Q3 emissions would actually fall by 12 percent. So even if its assumptions are valid, the Plan only makes a difference of three percent. But the Plan is built on three highly-questionable assumptions; that high-density housing will lead people to drive less

E3-Q4 and take transit more; that transit emits less co2 per passenger mile than driving; that reducing greenhouse gas emissions is worthwhile no matter what the cost. The core premise is that high-density housing will increase ridership, but Portland has tried this. For 25 years, Portland has had one of the most aggressive transit-oriented development policies, and it has failed. The Cascade Policy Institute up there has found that people living in four and five-story transit-oriented developments built in that city are no more likely to take transit to work than people living elsewhere. In downtown Portland, during the most intense investment in MAX, their light rail, the share of weekday commuting on transit actually fell from 40 percent of trips to 36 percent during the past decade, according to the city's own auditor. So we are repeating past historic mistakes here. Why are we repeating them? There's no need for this. You should just look at Portland's failure. Plan Bay Area rewards the construction of high-density housing units near transit, such as right here in north San Rafael Civic Center SMART station. This is going to inundate roads and intersections that are already at capacity with added traffic, and yet have no measurable increase in transit ridership. It did not work. They do not take more transit. The second premise, that transit emits less CO2 per passenger mile than driving, also fails to stand up to scrutiny. Trains in Austin, San Diego, and other cities are like our SMART train. SMART has not reduced its -- released its co2 figures publicly. So if we base it on those similar trains, the average per passenger mile of a train like the SMART train will be no better than the average car in 2025. Golden Gate Ferry is three times worse than cars, and Marin and Sonoma County buses are as bad or worse than cars. So this is built on bad premises; bad logic.

TONI SHROYER

E3-P1 Good evening. I'm Toni Shroyer. I'm a Novato resident and Marin County native. Currently the Draft Environmental Impact Report has failed with regard to public safety, and is developer-oriented and not public safety public-oriented. Public safety is essential to everyone. Developers advocate for best practices of management of multi-family dwellings of 40 units or more. Why? Because it is more viable or profitable for them. Profitability cannot have dominion over public safety. Adequate public safety should include all units; not just those of 40 units or more. Because of budget cuts, many cities and counties do not have a full complement of law enforcement personnel. This is true of staff of code enforcement officials as well. So my question is: Are we going to build even more units and stretch our current law enforcement personnel even further? The developers are being allowed to compromise public safety whenever they decide to build. For example, the California Tax Allocation Committee -- the CTAC -- allows nonprofit developers to have a 55-year tax exemption and are not held accountable for keeping their complexes free of crime. What we have seen in Novato, CTAC will request security cameras, security gates, and part-time security guards, and then the developer is deemed in compliance regardless. Clearly, this is not enough. There are two things we must accomplish: First, we must have best practices for all affordable and multi-family units, regardless whether they're clustered in 40 units or more. Two, there must be public safety impact fees imposed to developers to compensate for the stress placed upon the current infrastructure by high-density housing. Let's be people oriented; not developer oriented. Thank you.

FRANK EGGER

E3-Q1 Supervisors and Mayor, Frank Egger, President of Ross Valley Sanitary District. Speaking for myself only; not the Board. I also serve as Central Marin Sanitation Agency Commissioner. We treat the sewage from two-thirds of San Rafael, all of the Ross Valley, and Corte Madera; roughly a hundred thousand residents. To my knowledge, no one from ABAG or MTC or One Bay Area Plan has ever contacted the Ross Valley Sanitary District regarding our system's current status and future capacity. One Bay Area Plan and its EIR are fairly flawed. The Bay Area Regional Water Quality Control Board meets Wednesday, May 8th in Oakland to issue the final Cease and Desist Order against our Ross Valley agency. We have major structural capacity issues. The estimated cost to repair in that capacity is 180 million dollars. The One Bay Area Plan calls for 1,446 new residential units in Ross Valley, and 2,246 new jobs. Sewer collection treatment capacity issues must be addressed. For the record, Fairfax is one of the most affordable communities in Marin. How did that come about? Fairfax has height limits. Fairfax protects existing rental units. I authored the ordinance in the '70s, during a previous term as mayor. We made findings in past -- what I called the "Affordable Housing Act." No apartment or multiple residential housing unit in Marin may be -- in Fairfax may be converted to a condominium. I was personally sued by a developer for loss of his income because Fairfax prohibited his condo conversion application for 127 apartments that he wanted to set up and sell individually. Case law was established as a result of the developer's lawsuit. Fairfax has never lost a residential unit to a condo conversion. Unless employees in our communities can earn a living wage, affordable housing will be out of reach for them. During another term as mayor, I authored Fairfax's Living Wage Law, and to this day Fairfax has the highest Living Wage Law -- wage ordinance in not

only California, but the nation. Protect existing affordable housing. Stop condominium conversion. Make sure -- Mandate Living Wage Laws in all of our cities.

KERRY STOEBNER

E3-R1 Kerry Stoeber, Mill Valley. And I also want to identify myself as one of the members of the Marin Water Coalition that was here, I think, four years ago talking about the proposed desalination plant. And I think before we go further with the One Bay Area Plan, there has to be an identification of where the water is going to come from for this massive new development because we were told by MMWD that we were in crisis, that there was no more water, that we would run out of water unless we built a 400 million dollar desal plant; that contrary to the assertions that you want a -- greenhouse gas emissions cut down, a desalination plant uses nine times more energy than water obtained through conventional sources. And MMWD right now is the largest energy user in Marin. This is -- Not only that, but for our desalination plant that is proposed for Marin, we would take the water from our toxic -- the toxic hot spot -- San Francisco Bay -- that is filled with fire retardants, arsenic, pesticides, herbicides, and I do not think that these are all going to be removed via reverse osmosis. There are no safe levels for carcinogens. And that is what you would be asking us to replace our rainwater with from our seven reservoirs. We can be self-sustaining -- a sustainable watershed here in Marin, but not if we add the equivalent of an entire new town.

RAY DAY

E3-S1 Hi. I'm Ray Day. I'm a resident of Marinwood; been in Marin County for over 35 years. Just to restate this for everyone in Marinwood, we are not against reasonable affordable housing. We just don't need a hundred percent affordable housing. And that's the problem. I am in favor of "No plan for the One Bay Area"; reason being that with the densities proposed and especially in our area, it doesn't fit Marinwood and its open space surroundings. We have a beautiful community, and we are going to go ahead and fill it up with these several-story units to go ahead and accommodate the hundred percent affordable housing.

The people brought up water as one of the issues that is in this area. I'll tell you, being from Southern California at one time, 90 percent of the water is imported in Southern California. And San Diego tried a program to recycle that water. Media got ahold of it, and they called it "Toilet to Tap." Okay, folks? That's what we are going to have; Toilet to Tap. So get used to it.

E3-S2 The public needs to vote on this -- these plans. It shouldn't be left up for the discretion of public officials. They just don't have the common sense to vote for what we need. Please extend the deadline for the comment on the EIR. Thank you very much.

JAMES BITTER

E3-T1 James Bitter, Mill Valley. I want to avoid saying what I really think, like having to tell Susan Adams that reading -- she is reading the EIR report; having trouble getting through it. That report wasn't meant for public consumption. It was meant for the benefit of the consultants and their numerous -- it costs across this country millions of tax payer dollars. It was meant for their benefit. I want to avoid the sight of Steve Kinsey standing next to the sign -- the guy with the sign, "Apartheid in Marin." I am a native of Marin. It was one of the most embarrassing things I have seen in a long time; Judy Arnold at the Board of Supervisors criticizing people. At the visioning meetings, people actually came from the East Bay -- Can you imagine that? People from the East Bay. And they were a little bit disruptive. They were slightly -- about as unhappy as this crowd is about what you're doing. But let me remind Judy Arnold that ABAG and MTC are in the East Bay. They're in the same building. Steve Kinsey is on the -- is a commissioner. \$11,000, I believe, that he got sitting on that Board. He is going to vote for this thing. The rest of the Board is going to vote for this thing. The Board of Supervisors -- I'm running out of gas here -- they appoint the planning commission. As we speak, they are working on 17 sites where we are going to have 30 units per site. We have to do this. The Board has appointed them. The Board is -- our Board of Supervisors is the Plan. God help us.

SUE HESTOR

Hi. I'm Sue Hestor, and I am from San Francisco. I couldn't come to the San Francisco meeting because I was at another hearing. I support regional housing needs allocation for San Francisco and, if anything, it needs to be increased. Part of the unknown problem to very many people is that we are losing middle class and low-income housing by the tens of thousands in San Francisco because of upscaling to the -- I was going to say dot com -- the techies that are coming into the City and other upscale people.

E3-U1 The problem we have with the map is that San Francisco all along the Bay side is totally fill, a hundred percent fill. San Francisco grew by filling in the Bay. And we have marshes, and we have dead boats that are sunk, and the land is put on top of them that constitutes the San Francisco waterfront. At the same time, ABAG has this area as the area for growth of housing. I know this area. This area is not -- The only housing that can be built in this area, particularly south of Market, is high-end condos. We

E3-U2 need affordable housing, and yet the Plan calls for in-fill development on areas that will never take affordable housing. And sea level rise is an inevitable problem. Right now there is -- sea level comes in -- the sea comes in to the old marshes. We had deaths in Loma Prieta in the south of Market. Everyone knows about deaths in the Marina. We had them in south of Market. Where can I submit a map? A map. I want to submit a map. SUE HESTON: I came from San Francisco. Damn it. I want to submit my map. SUE HESTON: I wanted to submit --

HELEN LINDQUIST

E3-V1 I want to make a couple of comments. In the old days, marshes were filled in, levies were built, and they thought this was the way to go for housing and for farming. Now we know the value of marshes, and how they can protect the environment; how it is great for birds and in-coming tides, high tides. So let's not build any of this multiple housing on marshy areas. The SMART railroad is bad enough. It goes through a lot of it.

E3-V2 The other point is that I'd like a true scientific check for ABAG and MTC to do for basing their whole raise-on-bet on greenhouse gases. Greenhouse gas emissions are not a problem. They've gone down since we're using more natural gas. SB 375, which links this transport to a reduction in greenhouse gases is false hearing, and we shouldn't rely on that. Just as we shouldn't stick with AB 32 by Schwarzenegger. If you know anything about carbon dioxide -- we all breathe it, as do cars. So if you want to help the climate, stop breathing.

SHARON RUSHTON

E3-W1 Good evening. I'm Sharon Rushton. I am from the El Monte district in unincorporated Marin. And I'm representing Sustainable Tam El Monte, as well as myself this evening. The Draft Plan Bay Area's Draft Environmental Impact Report demonstrates that implementation of Plan Bay Area would cause 39 significant, unavoidable, adverse environmental impacts resulting in severe environmental harm and serious illness, injury, and loss of life. The severity, magnitude, and number of these impacts are astonishing. They include, but are not limited to: Impacts from insufficient water supply, inundation from sea level rise, exposure to hazardous materials, inadequate waste water treatment capacity, a net increase in sensitive receptors located in transit priority project corridors where there are high concentrations of cancer-causing toxic air contaminants --and fine particulate matter emissions. As well as additional environmental impacts --and sensitive --

CAROL SHEERIN

E3-X1 My name is Carol Sheerin. I live in San Rafael. I've been in my house for 46 years. Some of you may have read my letter in today's IJ. I also e-mailed a copy to every town, city, county-elected official to make sure they read it. I -- the letter basically asks for all officials of every town, city, and county to band together and request a six-month extension on the comment period en masse for us to have time to handle all of this. It was pointed out by Susan Adams that it was a 1,356-page document, which is much too much to read. Democracy is not given a chance to work with this Plan Bay Area. One speaker mentioned elections when you ob -- all of you are up for election. I'd like to give you a reminder that the democratic process for holding our elective officials accountable is a recall.

PETER LACQUES

E3-Y1 Peter Lacques, Fairfax, California. One minute; not enough time to comment. I have concerns in the Environmental Impact Report about water, supplies for the projective growth.

E3-Y2 I also have concerns about the location of many of these PDAs in areas that will be subject to rising sea level rise, which also is not adequately addressed in the Environmental Impact Report.

Fundamentally, according to ABAG's own handout, Chapter 5, Performance, I have questions whether this is the right way to go because the rationale for this is to increase affordable housing to reduce greenhouse gases. ABAG's own numbers indicate that as a result of the Plan, low-income people earning under \$38,000 after this is implemented will be spending 74 percent of their income on housing and transportation, versus 72 percent now. That's actually increasing the cost of housing and transportation; does not seem very effective. Likewise, commute times are going to either remain the same or increase. It does not seem to be addressing affordable housing or transportation.

E3-Y3

ANN SPAKE

E3-Z1 First of all, one minute is not enough to make comments, so mine will be in writing -- my detailed comments. I've spent at least 50 hours trying to read in detail the EIR on this Plan, to understand whether it really takes into account the things that we need it to address for sustainability, and I find it to be completely deficient. Again and again it states that the impacts are significant and unavoidable. I would suggest to you they are very avoidable. It consistently and repeatedly basically identifies and discounts the serious impacts that it states. The -- one of the fundamental flaws in it is that it addresses -- says it can only address the effects of the projects on the environment, but it cannot address the effects of the environment on the project. And I assume the project is people -- involves people.

MARGARET ZEGART

E3-AA1 I'm sorry to take the time. On Page 1.2-25, it says, in the DEIR: PDAs are nominated by local jurisdictions to appropriate places to concentrate future growth; existing neighborhoods by transit to provide a larger range and also to have a better, more friendly environment. Now, you people know that 250 percent of the new housing is going to be on floodplain. It's absurd. It doesn't meet equity; doesn't meet any standard at all. I hope that you will -- I appreciate all you do for us in the county. I really

do, but this is a mistake, and you can correct it. I don't -- I wonder if you can get -- grant us the money you've already accepted for two transportation projects because that seems to be tying down your good judgment.

PUBLIC HEARING ON THE DRAFT PLAN BAY AREA SAN FRANCISCO COUNTY

TRANSCRIPT OF PROCEEDINGS

Thursday, April ,
Hotel Whitcomb

COMMENTS ON DEIR

STEVE WOO

E4-A1 Good evening. My name is Steve Woo. I'm from Chinatown CDC here in San Francisco. We would like to call out today Section 2.3 of the draft EIR, which identifies potential adverse impacts due to the implementation of this plan. Specifically called out in Section 2.3 it is what the EIR considers the community's disruption and displacement. The draft EIR actually identifies that the addition of new housing units and commercial spaces in priority development areas could stimulate demand and attract new residents and businesses, resulting in new development types, higher prices and leading to displacement of existing residents. The draft EIR also projects that this plan will significantly increase density within the Bay Area's densest urban centers, which will impact local land uses, desirability and rents, resulting in what the EIR considers, quote, "permanent localized displacement and disruption." In addition, this plan calls for 160 major transportation projects around the Bay, impacting over 12,000 households. And the result of this called out in the draft EIR is specifically the potential to disrupt and displace communities. So regardless that the draft EIR goes on to list mitigations for these impacts, the mitigations are an important thing to note because under the new CEQA streamlining laws, provisions of SB 375, if a project satisfies mitigations, the project can go forward in the new streamline CEQA process. So taking a look at the mitigations is very important; however, the mitigations in the EIR do not go far enough, and, frankly, are deficient in addressing the community disruption and displacement concerns. So what we would like to see and to have commented for the record is further analysis in the EIR, an analysis of mitigating long-term impacts of displacement and disruption of communities, further analysis of housing affordability needs within PDA today compared to post-plan implementation and how increased density within the PDAs will impact affordable housing needs. Analysis of how to link housing density, which the plan calls for, to creation of new affordable housing for low- and moderate-income folks to offset displacement. And also, principle of one-to-one displacement -- one-to-one replacement and relocation of all low-income households directly displaced by the Plan's transportation projects. Thank you very much.

JOEL RAMOS

Good afternoon, Supervisor Mar and Commissioner Halsted. I really appreciate the opportunity and the format that this is -- that you are all facilitating here. For full disclosure, my name is Joel Ramos. I work for TransForm. I'm Senior Community Planner there. I'm also appointed to the MTA Board of Directors. I'm not speaking on behalf of the MTA tonight. Tonight my opinions are my own and TransForm's. I am a resident of San Francisco and work over in Oakland. We are deeply supportive of the direction that we're heading.

E4-B1 We don't think that we got it all together yet, but we're certainly headed there. We're really happy that the EEJ alternative, the scenario that we suggested, emerges the environmental and superior scenario, and we hope that you will -- that the Commission will move towards adopting the strongest elements of that scenario.

What we are concerned about is a couple of things that I think most folks have already mentioned this evening: The lack of really addressing the affordable housing needs that are going to be -- that are going to come to the Bay Area with this plan. We're particularly concerned that we found that in the plan that after build-out, even in the best case scenario, we're expecting people of lower incomes to spend a full 73 percent of their incomes on housing plus transportation, and we don't see that as a sustainable way of controlling the sprawl that we're going to be trying to limit. What will happen eventually without stronger policies in place to protect that from

E4-B2 happening, these folks will end up living further and further away from a place like San Francisco, and we will then encroach on our precious farmlands and open space that we're so fortunate to have in this Bay Area.

The second point that we're mostly concerned about is something that Ms. Vaughan spoke to earlier, which is the idea of widening freeways. We understand that we need to make our freeway system more efficient, and one of the ways we can do that is simply by just refurbishing some of the lanes that are already in existence, turning them into high-occupy toll lanes and use those revenues to fund the transit that we so sorely need. That's all I have time for. I thank you so much for your service and look forward to furthering the conversation.

PETER COHEN: Good evening. Thank you. Peter Cohen, Council of Community Housing Organizations. I've heard a lot about affordable housing. Well, we're in that particular line of business as an advocacy coalition. I just wanted to remind us what's at stake here from a long-term vision standpoint. We're talking about going from regional development that's maybe 50/50 between urban and suburban development, something in the order of 65 to 70 percent of growth in more compact urban areas. And that sounds good, but what does it mean? What are the implications? For San Francisco, that means 92,000 new housing units, which is about 25 percent of all the new

E4-C1 growth in the major cities of the Bay Area. 25 percent of all this new urban development is to be in this city. That's a high state for us. What does that mean at ground level? Steve Woo was here earlier from Chinatown Community Development Center who pointed out -- and interestingly enough, the EIR calls it "community disruption and displacement." That's some pretty interesting words, but that has been all along for our organization not an antigrowth perspective but concerned about the implications of growth when you particularly overload a system at the community level in a place like San Francisco. The report shows that under the proposed Plan Bay Area

scenario, that the potential for displacement goes from 21 percent to 36 percent. For all the good planning and thinking and empathy that has gone on over the last three years, the proposed plan increases the potential for displacement from the existing 21 percent where we are already struggling to keep our community stable, to 36 percent. What are the mitigations and safeguards? There's no funding in the SCS for affordable housing. And I want to point out the folks who are here supporting affordable housing, that planning for affordable housing is totally different than funding for affordable housing. You don't get nothing out of the plan, unless there's dollars for that to be built. So this is an aspiration, not a reality. Moreover, building affordable housing is not the only answer. We need to stabilize our existing community, so my last point is, we put just as much importance in anti-justification and anti-displacement policies that need to be part of this plan as much as building new housing, and we don't see those in there either. We encourage the staff to continue working on this, but we're still very concerned about the destruction potential at ground level. Thank you.

KATE WHITE

Good evening. Kate White. I've lived in San Francisco in the Mission since 1996, and I want to thank the decision makers, our leaders here and our staff for the many -- I think it's years. I was going to say months, but many years of working on this plan, and I am thrilled to see that it is -- I believe, 100 percent of the growth is planned within urban growth boundaries, so we're hopefully moving in a better direction away from sprawl in this region. So thrilled about that. I think the plan could be even better, and I urge you to look at the equity environment and jobs alternative. Some of the components there would add more homes, including affordable in places that -- where it really makes sense; where there's the most opportunities with more jobs, access to public transit, good schools. And I also think the EEJ alternative put some more incentives for cities to prevent displacement and supporting building homes that people of all incomes can afford. And so take a look at EEJ alternative and bring less traffic, healthier residents, fewer traffic deaths, more affordable neighborhoods and would do a better job in allowing our most vulnerable neighbors to stay in their homes. Thank you.

And also to -- I am still concerned that we are putting money into highway expansion. In this day and age, it's almost shocking when you think about it. In San Francisco, as you know, we're taking down the freeways, and we're creating wonderful parks, boulevards, more housing -- affordable houses, revitalizing places like Hayes Valley, the Embarcadero -- the Ferry Building would not have happened if we didn't get that freeway down, Embarcadero Freeway. So I really think we need to shift more money -- billions of dollars away from freeway expansion to transit, and as one of the 40 percent of San Francisco who does not own a car and doesn't plan to, I really would like to see our transit system working a lot better, and that means money and investment.

STARCHILD

Good evening. My name is Starchild. I'm a Bay Area native and San Francisco resident since 1995. I have been coming over here a lot longer than that because my grandmother lived in the city growing up. I oppose Plan Bay Area for a number of reasons, including things that other people have mentioned. The overall scope, I think -- the problem is simply that there's a failure to recognize that economic freedom works better. That means letting people make their own individual choices instead of having Government come along and make people's plans for them and confiscate their money to pay for them. I'm concerned about the lack of transparency in this process. It was mentioned that there was a 1,300-page or something report. You know, how much money did it cost to prepare that report? And how much is this overall planning costing? What are the salaries of the people involved in this planning process? And is there taxpayer limited government advocate representation in the actual nuts and bolts plan and not just these public meetings. There's a lot of things that we could do that I think would not involve the Government that would help the whole agenda, which, you know, is good in many ways. Reduce sprawl. We could make it easier to develop housing in the cities, reduce costs of permitting, reduce building code requirements, these kinds of things. We could de-criminalize hitchhiking. We could de-criminalize riding skateboards and bicycles on sidewalk in cities. Do things like that to encourage transportation. Stop criminalizing people for sleeping in their cars. Many people are poor and can't easily afford housing here, and part of the reason they can't afford housing is because property taxes are too high. That doesn't just affect owners; it affects renters because that gets passed along to renters. And costs that are imposed on business get passed along to employers in the form of lower wages and fewer jobs. The Government redevelopment also has a history of racism in this town. The Western Addition used to be the city's primary African-American neighborhood, was decimated by the city's redevelopment agency during the 1960s. Blacks were forced out in massive numbers and many businesses were forced to close. I urge you to take these things into consideration and include a less-Government libertarian perspective in the actual plan. Thank you.

METROPOLITAN TRANSPORTATION COMMISSION
ASSOCIATION OF BAY AREA GOVERNMENTS

PUBLIC HEARING ON THE DRAFT PLAN BAY AREA
SAN MATEO COUNTY

REPORTER'S TRANSCRIPT OF PROCEEDINGS
Monday, April 29, 2013
Crowne Plaza Hotel

COMMENTS ON DEIR

JEFF HOBSON

Hi. I'm Jeff Hobson. I also I work with TransForm, and we'll be submitting some more detailed comments in writing as well focused and more a bigger picture of this evening. I don't live here in San Mateo County. I live in Alameda County, but I can't go to Alameda County's meeting on Wednesday night because I'll be coaching a Little League game. And I see a little bit of similarities between the reasons that I coach in Little League and the reasons that I'm here this evening to talk about this regional planning. I also happen to participate in my kids' schools' PTA. I'm on -- I'm the treasurer of the homeowners' association in the condo I live in. And I do all of those kinds of things because I believe in collective action to try and make our lives better. I think we can do well by doing this planning. So I appreciate the work that all of you are doing to try and help make all of our lives better through that mutual planning. I also want to talk about freedom a little bit and talk to you about my wife's aunt who lives in San Mateo, not too far away. She just turned 70, recently retired from teaching at San Francisco State for many years. She still drives some, but she doesn't think that she is a safe enough driver to be out on the freeways. And she's probably not alone. And so she gets around almost entirely on public transit. Certainly, when she goes any distance -- she does come up and visits me and my family. And so she depends on having the freedom of having public transit available to her in order to be able to live her life. I hope that through this plan that we are able to do more investment in public transits. We would like to see more investment than is actually in the Draft Plan as it stands. So we notice that in the Draft Plan, the Draft Environmental Impact Report that came with it, looked at several different scenarios and found that one of them, the equity of the job scenario -- Well, it's the best one. So we'd like to see that.

E5-A1

BOB COHEN

Good evening. Thank you for letting me speak. My name is Bob Cohen, and my wife and I are long-term residents of unincorporated San Mateo County. I consider myself a pragmatic environmentalist, but I'm also an oceanographer and a certified consulting meteorologist. As a scientist, I'm very interested in the climate change debate, and I think that's portrayed as a small part of the One Bay Plan, but it's also shown as the Number 1 goal of the plan in the room next door. And I would like to bring to your attention some observations which have been ignored in the preparation of your plan, but they have a huge impact on the decisions you're making today. I have a plot here, which I'll deliver after I talk, of sea level of San Francisco from 1850 to present. It's available from NOAA data. It's public data, and you can see a constant slope during the entire period from 1850. Given that CO2 only started increasing in 1950 until present, there's no change in the slope of the sea level, which proves that sea level is independent of carbon dioxide increase. Similar plots are available worldwide, including Europe and New York City. And my question to you is, what verifiable assumptions are MTC and ABAG using for sea level changes, and how do they affect the climate change portion of the One Bay Area Plan? There's also a series of reports from the Intergovernmental Panel on Climate Change, the IPCC. And they've so far issued four reports in their -- they have another one in preparation to be published in 2014. Fortunately, that was leaked to the press about two months ago, and I have here a plot from that report, which I'll also give to you afterwards. But this graph shows that temperatures have been stable, not increasing, since 1997. And you can see with the plot of temperature that the models are not predicting the observations. And so that the observations are now --

E5-B1

GAIL RAABE

Good evening. I'm Gail Raabe, a resident of Redwood City. When I read the Draft Plan and related documents, I was pleased to find these three statements: "The Plan will create livable communities, reserve open space and direct development within the

2010 urban footprint, promoting development and priority development areas, takes development pressure off the region's open space and ag lands. Open space preservation requires regional solutions." What I didn't find in these documents is any

E5-C1

assurance that this plan will actually protect the region's important open space lands. The plan's draft EIR acknowledges that many of the transportation projects could induce further development onto farmland, open space and even into the bay. A good example are the 1,400 acres of salt ponds in Redwood City. The ponds are designated in open space in the city's general plan. They're under Williamson Act open space contract. They provide habitat for thousands of migratory shore birds. The scientists identify the ponds as important for marsh restoration. They're included in the approved expansion boundary for the National Wildlife Refuge. And finally, the site is threatened by potential new development plans. By all measures, the salt ponds are a great candidate for ABAG's priority conservations area designation. And yet when six local and regional groups submitted an application for consideration, the Redwood City council did not forward the application on to ABAG, so now there's a real concern. If the transportation improvement projects for Redwood City are implemented, they will definitely help Redwood City's award winning downtown plan. But these same transportation improvements will make the salt ponds even more vulnerable to future bay-fill development. There needs to be a strong regional mechanism in place to insure protection for the Bay Area's open space lands. This objective is a critical part of the Bay Area plan that has not been adequately addressed. Thank you.

JOSHUA HUGG

Hi. Josh Hugg. I'm a resident of San Mateo. And I came here 15 years ago as an engineer for Intel. I worked in R&D down in Santa Clara, and I wouldn't have even considered coming here had I not been given a salary that allowed me to buy a house. Points of my mortgage; took care of all my closing costs. By moving into my neighborhood of San Mateo, which is north central, which is also considered by MTC as a community of concern. I made it that much more difficult for my neighbors. And Silicon Valley is a very special place. We draw from an international pool of workers. All of them are -- have had similar deals that I had or even better. If you've -- the net result of the decades is, we've relegated over half of our workforce to commuting in, and a lot of those people -- you know, they grew up in our community. And when there was ever a chance to buy a house, they looked at the prices and just left. I'm very happy that we -- that we're moving forward with the sustainable community strategy plan because I think it helps address some of these gaps, maybe not aggressively enough. I would encourage you to look closer to the equity environment and job scenario for some of the proposals that it has. But we have to stop bleeding our communities. North central has some of the worst overcrowding. If you're not commuting into the county, then you're moving into overcrowded conditions. If you're graduating from college, more likely than not, you're moving right back in with mom and dad, and that only lasts for so long. So with the priority development areas that are being proposed, I would hope that we can maximize those high opportunity areas; access to transit, access to amenities. My mother-in-law takes advantage of that in Redwood City. More people need to be able to take advantage of those high opportunity areas.

E5-D1

WILLIAM NACK

You ready? Good evening. My name is William Nack. I've been a resident of San Mateo for 47 years. I'm here this evening to speak on behalf of San Mateo County Building Trades Council, representing 26 local San Mateo County construction unions.

E5-E1

While there will be some negative impacts from construction as a result of this plan, the Draft EIR and the plan itself missed a critical positive impact as a result of the proposed alternative; that being jobs, millions of construction industry jobs. In addition, the EIR in its mitigation measures should make policy recommendations encouraging or requiring project sponsors to pay the workers area standard wages and require local apprentices who are enrolled in the State of California approved apprenticeship programs to be part of the construction team. Without labor standards in the plan and the EIR, the transit-oriented housing that will be developed as a part of this plan will not necessarily benefit local workers or pay decent wages. Creating middle class jobs is a key to improving the health of our local communities. Decent wages will ensure the construction workers can afford housing in the Bay Area. This will allow them to travel fewer miles per day to get to work, thereby improving their health and decreasing air pollution from vehicles. Highly skilled and continuously trained local workers will be permitted and accountable to implementing the best environmental mitigation measures envisioned by the EIR for construction projects. The outcomes of the proposed mitigation measures in the EIR will depend on the quality and commitment of the workforce that will implement that. I look forward to working with you to implement these proposed amendments to the plan and the Draft EIR, and I thank you for allowing me to speak to you this evening.

METROPOLITAN TRANSPORTATION COMMISSION and ASSOCIATION OF BAY AREA GOVERNMENTS

PUBLIC HEARING ON THE DRAFT PLAN BAY AREA -- SANTA CLARA COUNTY

REPORTER'S TRANSCRIPT OF PROCEEDINGS -- WEDNESDAY, MAY 1, 2013 -- HILTON SAN JOSE

COMMENTS ON DEIR

SUSAN STUART

Hi, I'm Susan Stuart. I'm with the County Public Health Department. And -- which is a member of the Bay Area Regional Health Inequities Initiative. We'd like to commend the regional planning bodies and the participating stakeholders for this innovative effort. The draft plan is an enormous step towards sustainability, as it prioritizes existing transportation and focuses on the location of housing near transit, the reduction of premature deaths from particulate matter, the preservation of ag land and open space and the investment in local projects that support focus growth through the One Bay Area grants.

E6-A1 However, a major concern with the draft plan is the displacement of vulnerable communities that would result from the dramatic increase in the cost of housing and transportation predicted in the draft plan. The plan expects lower-income families to spend nearly three-quarters of their income on housing and transportation, leaving very little for food, clothing and education. This is both a financial burden for individual families, as people are saying, and a threat to the viability of the local economy. It also means that a large percentage of the population will continue to spend long hours in commutes to work, making it difficult for them to spend time with their families in their communities and difficult for them to get physical activity, which is so important in the prevention of chronic disease.

Another concern is the expected rate of injury and fatality collisions in the communities that will experience the biggest growth and the need to invest more heavily in projects that calm traffic and make roads safe for all users. Going forward, we ask that you continue to partner with Public Health and refine methods for measuring impacts on health. One example is the Integrated Transport and Health Impact Modeling Tool that was developed with MTC staff. This research determined that for every 1 percent increase in active transit commuting, the region could expect a roughly 1 decrease -- 1 percent decrease in mortality.

E6-A2 We urge the regional agencies to continue to explore alternatives, including the Equity, Environment and Jobs Alternative, which was called the environmentally superior alternative in the draft EIR. Thank you.

CHRIS LEPE

E6-B1 Hello. So my name is Chris Lepe. I'm the community planner for TransForm, a Bay Area transportation advocacy organization. And, you know, overall, we support the plan. Plan Bay Area is going to bring people closer to their jobs, and it's going to provide better transportation options. For the first time, transportation projects are being ranked in terms of cost-effectiveness and benefits for the environment and for communities. So this is a greatly superior plan from where we have come from before, from previous plans. And -- however, we do have few different concerns. In particular, the HOT lane network. So we are not

E6-B2 opposed to HOT lanes, but we are opposed to adding excess capacity.

And so we would like to see, instead of the revenues from the HOT lanes go towards additional highway expansion -- what we'd like to see that instead go to is transportation options -- better public transportation options. For example, shuttles, you know, buses along -- express buses along the freeways and also a low-income pass to allow for low-income individuals as well as youth, a youth pass -- to allow them to be able to access different destinations. So I think the HOT lane network is one of the main concerns that we have, but we think that can be fixed. Also, we would like to see more funding for transit operations. So with the EEJ, the Environment, Equity and Jobs Alternative, there's actually a significant amount of additional transit operations projected as part of that plan that will help reduce our greenhouse gas emissions and get people from Point A to Point B.

E6-B3 Finally, as we invest in communities such as low-income communities, we should try to avoid the displacement of people living in those neighborhoods. Because those are the folks that are dependent on our public transportation services. So we would like

E6-B4 to see anti-displacement measures as part of the plan. And just -- I'd like to finish by saying that the EEJ alternative provides so many more benefits in regards to health, the environment and just improving the quality of life for Bay Area residents. Is that my time?

SUSAN M

E6-C1 Hi, my name is Susan, and I'm from Gilroy. And I do want to say -- just add to what Jeff said about the population. Because people are leaving California. California is the highest-taxed state in the country, with New York, and it's going to get worse. So people are leaving, they are not coming in. So I've got to say that the -- that that has to be looked at again, because it's not going to reach that. But, anyway, I want to say, regarding -- I perused the EIR, the 1335 pages of the EIR, and what I see is total

E6-C2 control over my life. It's in housing. It's in transportation. It's in land use, taking away from agriculture, ranching. We used to be the breadbasket of America, that's gone. Okay? You are opening up space that you say can be used by the public, no, we can't go on these lands anymore. They are going into open space to just sit empty. Is this to put on the solar things to run the energy we need for our electric cars. What I see is the total control of my life, and I did not vote for this.

I'm just going to address a small part of it, because it's got to do with the electric car issue. Have we looked at -- first of all, electric cars are cost-prohibitive. That young gentleman, Mr. Chen, who spoke first, he wants to get into something a little bit more cost-effective. That car will cost him 20,000 more than a gas-fueled car. They're poor performance. They've gone under

with taxpayer money. There's some failures in the Volt, with the engine fires. Fisker was billions of taxpayer monies that failed. There were recalls on Toyota Priuses. And my question is, where are the recharging stations going to be and how much are they going to cost? And what are the hours that are going to be needed to recharge your vehicle? I wonder if all of that has been addressed. And where is the -- this is electricity to recharge, right? Aren't we looking at limiting the use of our electricity? Where are we going to get that electricity?

SUSAN RUSSELL:

Okay. I'm speaking from the League of Women Voters of the Bay Area. We strongly support regional planning that coordinates Bay Area transportation and housing land use decisions to reduce greenhouse -- greenhouse gas emissions and to meet the region's full housing needs for people of all incomes, in accordance with SB 375. Done well, regional planning will protect our environment, improve our economy, increase social equity, conserve agricultural lands and make our lives safer and more secure. These are region -- issues of regionwide importance that require thoughtful regional policies.

E6-D1 The recently released draft EIR and the equity analysis provide a wealth of information that should be used to improve the draft Plan Bay Area approved for study. In particular, we note that the draft EIR identifies the Environment, Equity and Jobs or the EEJ scenario, Alternative 5, as the environmentally superior alternative among scenarios analyzed. The EEJ alternative also outperforms the other alternatives and most of the performance targets and equity metrics your agencies have adopted. Compared to all the other alternatives, the EEJ alternative would bring us less traffic, healthier residents, fewer traffic deaths, more affordable neighborhoods, and would do a better job of allowing our most vulnerable neighbors to stay in their homes. We urge MTC and ABAG to incorporate the best elements from the EEJ alternative and add key mitigations into the final Plan Bay Area to improve outcomes on a host of issues vital to the future of the region.

In particular, with regard to affordable housing, plan for sufficient housing affordable to low-wage workers in all infill locations with access to jobs and transit. With regard to displacements, strengthen the One Bay Area grant program to better incentivize local anti-displacement and affordable housing policies. Fund mitigations such as land-bagging and housing rehab. And with regard to health and active transportation, fund more active transportation and complete streets programs to maximize health co-benefits of physical activity and transit use and better mitigate air pollution.

LIBBY LUCAS:

Hi. My name is Libby Lucas. My background is environment and recreation. I probably shouldn't be speaking because I have yet to get ahold of the -- a copy of this document to really read it in hard copy. I looked at the transportation plan briefly today at one library, but the other libraries didn't have the documents. I think that my biggest concern is -- the meeting the other day, **E6-E1** someone waved two or three pages in the air and said, These are all the wetlands that are going to be impacted. I think when AB 375 was passed, it was to address climate change. And I think the wetlands, marshes, are your best way of mitigating for car emissions. The equestrian capability is quite extraordinary. And yet if you -- if this plan is removing acres and acres of wetlands, I think that's highly questionable as far as overall planning. You know, the salt pond restoration is lovely, but it's a lot of open water. It doesn't do the same job the marshes themselves do. And so often your expanding of a highway like 101 is then impacting the marshes that are still there as a buffer.

E6-E2 And I guess my other concern is that with the density increase, you have to consider the schools and the libraries and the places for children to play. And the minute your population density gets to a certain point, they're the ones that are going to be suffering if they can't, you know, fly a kite or swing a baseball bat. So please look at the overall impacts that your plan is making. Thank you very much.

CAT NGUYEN:

Hello. My name is Cat Nguyen. I'm with the Vietnamese Voluntary Foundation, VIVO. And, first of all, I do want to thank the -- everyone who was part of Plan Bay Area. I feel like this is the first time ethnic communities, immigrant communities, refugee communities was really asked to be involved in the outreach. And there was a very active effort to get us involved in the outreach. So we do want to thank you. And the staff has been really great about that. In general, we do support the Plan. We do agree with TransForm and some of the other groups that the Environmental, Equity and Jobs Alternative is a plus to the plan, in general. The main emphasis we would like is affordable housing to low-wage workers in infill locations with access to jobs or transit. Thank you.

MICHAEL DITTMER:

E6-G1 Hi. My name is Michael Dittmer, and I'm from DeAnza College. I'd like to also voice my support for Plan Bay Area. But, like Chris Lepe, I'd like to support my -- voice my support for the EEJ option.

E6-G2 I believe that the money from the HOT lane should be used to support public transit options instead of simply more lanes in the road.

E6-G3 And I also believe that the displacement that poor and low-income people are facing in our housing should also be addressed as well. Now, there's a lot of people here who seem to think that we're going to, you know, tell people where they have to live, tell them what car they have to drive, and that simply isn't true. We need to think about the ways that our car-centric planning has ruined people's lives. Think about what New York City did during the 1960s under the design -- under the traffic planner -- who I believe his name was Robert Moses. And what they did is that they destroyed neighborhoods in order to build more highway. If that's not government intrusion in your life, I don't know what is. That is very clear and an example where we need

to empower people with our transit options and our housing options instead of limiting what they can do because they have to purchase a car and they have to drive on the highway.

The simple fact remains that if we were to put this to a vote, severe problems could happen. So, for example, when BART was implemented, there were certain counties like Santa Clara County that did not approve of the plan. And, as a result, BART was -- BART was fragmented across the Bay Area. The simple fact remains is that we need to coordinate our effort in order -- so that in -- for an example, like Plan Bay Area, so that we can get an effective solution. If Santa Clara County was to vote against the plan and Alameda County was to vote for it and then another county voted against it, we'd get fragmented implementation. And that would be worse for everyone, including those taxpayers who want their money well spent. The fact remains is that there are plenty of externalities to our car use. People are dying. There are about 40,000 people who die from car pollution each year because we drive cars. That needs to change. That costs lives. That costs money.

And, ultimately, we need public transit solutions that actually solve that problem. Ultimately, we don't need our public transit solutions to distribute money from the poor to the wealthy through the use of HOT lanes that would prioritize wealthy people over poor people, even when poor people pay for those lanes. Thank you.

CECILIA NG

Yeah, so Michael is a very hard act to follow, but I'll do my best. All right. My name is Cecilia, and I'm also from DeAnza College. And, first, I'd like to really thank Plan Bay Area for recognizing and honoring all points of view by having these faces, faces like these. I'd like to push for more -- like others said, to have more community voices speak in these things, and reach out to them so they can provide their input. And, specifically, I have come here today to show support for the Environment -- Environment, Equity and Jobs Alternative. And I'm -- I'm personally coming to speak as a person of color, a student who plans to study in the Bay Area and ultimately live in the Bay Area, work here. And, really, I'd like to show my utmost support for the EEJ, because it is the best. Because it's going to bring us less traffic, healthier residents and fewer traffic deaths and more affordable neighborhoods and it would do a better job of allowing our most elderly neighbors to stay in their homes.

And then, really, like, my perspective is that for the Plan Bay Area to continue, we have to look at long term and always keep in mind environmental justice. And for that to happen, we need to make sure that low-income people do not get priced out and left out of the planning. And for that to happen, I'd like to show my support for rethinking how we're implementing the new HOT lanes and to show support for better funding for public transportation, better public transportation options, such as BRT. And I'd like to also show support for protection against displacement; specifically, for people with low income in housing. And -- yeah. Thank you very much for your time.

MOUNIA O'NEAL:

Hi. I'm Mounia O'Neal. I just want everyone who is here and a student, raise your hand. Because I think it's really awesome. We brought a lot of people from DeAnza College, who are going to be transferring soon to colleges in the Bay Area. Just because -- this is something that really affects our lives, as students who have lived here our whole lives, such as me. I've lived here for 20 years, my whole life. And I've seen how a lot of the policies that have been implemented have impacted my own life, as a daughter of a single mother and someone whose father was in the Army, just because of how difficult it could be to get around and to access a lot of the resources. And so I really do want that freedom of choice of not being able to -- of not having to drive continuously. I -- I used to nanny, and I worked -- two full-time jobs now. And so driving around and taking my siblings everywhere is just a huge burden on myself and on my family. To implement something like bus rapid transit, that would basically make access to our schools and to our communities -- you would basically be saying that you don't need a car to be an active member of our community, which I don't think should be true. And just in terms of the environmental justice. When I was a nanny, I could see so many of the kids that I worked with would -- are developing asthma and having, basically, a lot of -- sorry. I'm getting really nervous. A lot -- sometimes when we think of these things like environmental justice we kind of see it as a huge theory rather than something that's actively in the lives of a lot of Bay Area residents. So I just want to voice my support for the EEJ plan and for including students, people of color, minorities, disabled folks, in this plan. So thank you so much.

ANARUTH HERNANDEZ:

Hi. My name is Anaruth Hernandez, and I'm with DeAnza. I'm a student at DeAnza school. Go DeAnza. And I just really want to thank you guys for having this plan. I am in support of the plan. I think it's very mindful and thoughtful to try to think ahead.

And I really like the gentleman's vision of not just thinking ahead but being innovative with all the resources that we do have

here. I would like to voice my, I guess, approval of EEJ, which is the Environment, Equity and Jobs Alternative. I think it is very important. It's a very important aspect of how we move forward, and I think that the Bay Area needs to.

So some of the things that I really like about this plan is affordable housing. And I know that it has a lot of different definitions. To me, it means being able to live in a house, in an apartment, with my two parents.

Public transportation, it is very -- it's very important. Without it, my dad would never get to work, which is about a three-hour bus ride. And so on and so forth. I think what I would really like to make sure you guys understand is that the impact is realistic. And not only would my dad not be able to get to work, but my mom wouldn't, either. And I -- they actually leave me the car. So I'm a student. I get to work and take the car and drive to school. And I really like that, but I need -- I need to not be able to have to rely on a car. And there's a lot of opposition against this plan, and I think it's because -- like another gentleman said,

everyone comes from somewhere. Right? And that's just -- that's just how it is. But I can't express how much it means to me that you have these public hearings. And I really hope to participate more. Thank you.

BRIAN DARROW:

E6-K1 Hi. Good evening. I'm Brian Darrow with Working Partnerships USA, and I'm here to express our support for most of the Plan Bay Area draft. We think the plan is really a step in the right direction. Particularly, we're glad to see that all of the growth is really focused within the existing urban service area, bringing housing and jobs closer together. I think most of us who live in Santa Clara County know that we have vast opportunities to live in low-density suburban communities. I grew up in one. And we'll continue to have those opportunities. What we lack is options for more walkable neighborhoods, with access to transit. So we're glad to see the region starting to plan to invest in that type of growth, in incentivizing cities to move in that direction if they can.

E6-K2 What we think is missing, however, from the plan are some of the best aspects of the Environment, Equity and Jobs scenario. In particular, we'd urge MTC and ABAG to strengthen the One Bay Area grant program to better encourage anti-displacement and affordable housing policies. It's critical that we don't push out the families that rely most on transit from the areas that are being improved by transit investments.

E6-K3 Secondly, we'd ask that you prioritize transit operations with future unrestricted funds. And please ensure that the HOT lane network is designed in a way that mitigates the impacts on low-income commuters. And also that we use existing highways rather than spend money on building expanded freeways.

Finally, I'd just like to make the point that we'd like the plan to consider the quality of the jobs that development creates. Unfortunately, one-third of jobs in Silicon Valley now pay less than enough to meet the basic standard for self-sufficiency. In 2000 that was one-fourth of the jobs. So we're moving in the wrong direction. In other words, it's very hard for workers to afford to live here, which increases commute times, it increases traffic congestion, and it lowers quality of life. We'd like to see standards in the plan to encourage using a local work force and encourage jobs that pay sustainable wages that allow folks to afford to live here. Building a strong middle class doesn't just happen by itself. It's the result of conscious policy decisions and long-term planning. So it's important to make sure that our land use and transportation plans consider and promote the creation of quality jobs. Thank you.

SUSAN MARSLAND:

Thank you for the opportunity to speak. I am here to support SB 375 and the plan area draft of the plan that we have in front of us tonight that emphasizes housing elements and transportation. This plan does prepare the San Francisco Bay Area as an economic player in a global world. I do have one concern about Target Number 7 on equitable access, and hope that the 10 percent decrease on Page 108 can be raised to help struggling households. And those kinds of households involved all kinds of people, from teachers, police, fire. And we need to do a little bit more to support those people. If you can please incorporate some of the recommendations from the EEJ, which will help also address the gap in equitable access for all people. Thank you. And thank you to the students that came tonight. I have a lot of respect and admiration for you being here. Thank you.

JEAN RYAN:

E6-M1 Hi. I'm Jean from Morgan Hill. And I understand where those DeAnza students are coming from, because at one time I was a student and wasn't making -- very little money. But the American dream is to have your own home, and most of these homes are in suburbia. And part of this plan is taking money out of suburbia to finance this regional plan. I downloaded the 1300 pages of this EIB report, and I was able to get through the first 100. And the thing that hasn't been mentioned here is about the vehicle miles driven in your plan. I think eventually you want to impose a tax on people who drive cars and record how many miles they drive and tax them accordingly. To this I find a terrible thing in California, because we're being taxed already. But to tax the miles you are driving? Who is that going to hurt? It's going to hurt low-income people, anybody trying to get to work. I think it's vastly unfair. But this is something that was not mentioned, but it is in your report. Thank you.

METROPOLITAN TRANSPORTATION COMMISSION
ASSOCIATION OF BAY AREA GOVERNMENTS

PUBLIC HEARING ON THE)
DRAFT PLAN BAY AREA)
SOLANO COUNTY)

PUBLIC HEARING
REPORTER'S TRANSCRIPT OF
PROCEEDINGS MONDAY, APRIL 22,
2013
SOLANO COUNTY FAIRGROUNDS - MCCORMACK
HALL

Comments on DEIR

Bob Berman

I'm Bob -- I'm Bob Berman and I live in the city of Benicia. And I guess I generally support what I've read so far about the plan.

E7-A1 My main focus here tonight and my main focus of the work I am doing is to ensure protection of the Bay Area and Solano County's open space and farm lands. So I do have a couple comments. In regards to goal one, which is safeguard and restore the berm and habitats, the plan seems to fall on the protection of open space only as a consequence of development and does not map out strategies or policies that can ensure the berm and protection of conservation lands. The One Bay Area Grant Program directs ten million dollars as a part of a pilot plan to support the priority conservation rights, but I would note that this is only a fraction compared to 310 million dollar investment provided for the priority and voluntary transportation and improvements. So one specific request I would make is to grow the One Bay Area Grant Program, the pilot program, in terms of the priority conservation areas, focus investment from all sources on protecting and managing the high priorities conservation

E7-A2 lands that are not yet currently protected and this is especially important in Solano County. In terms of agriculture, again, I think the plan does a good job in recognizing the value of agriculture; however, beyond the One Bay Area Grant Program, there are really no measures to ensure the permanent protection of agricultural lands, nor policies and strategies that facilitate the growth and improve deficiencies of that agricultural so agricultural is set. So, again, I think we could be doing better policies and

E7-A3 programs. In terms of goal three, which is to provide all Bay Area residents to access of parks and recreational open space, I believe that the plan could explicitly call out better our plans to increase parks in urban and suburban areas and to improve access to and the utility of open for recreation. In addition the plan could identify a purchase of increase of residents' and visitors' abilities to access parks and trails by public transportation. And in terms of Solano County, I would note that we have two state parks here in Solano County, both of them in the Vallejo/Benicia area. And one of them certainly, the Benicia state recreation area, but both parks are on the state's original closure of the state parks. And although records are done in the Benicia State Capital Park, the Benicia State Recreation area is certainly is in danger of closing for changed circumstances in the future. And, finally -- so I would just simply say that overall, I think the plan lacks a specific actions of policy needed to ensure long-term protection and investment of the Bay Area's park open space. Thank you.

METROPOLITAN TRANSPORTATION COMMISSION
ASSOCIATION OF BAY AREA GOVERNMENTS

PUBLIC HEARING ON THE DRAFT – **COMMENTS ON DEIR**
PLAN BAY AREA
SONOMA COUNTY

LLOYD GUCCIONE:

You are blessed, my son. I'm very glad to have heard the speakers who came before me. I'm very glad to have seen Mr. Grabill here and the comments that have been made already. My concerns perhaps are a little bit different. I have problems with regional government concerns. I have problems that the vision, notwithstanding the excellent work that has been done on planning transportation and trying to resolve issues -- I believe it will not resolve the issue. Why? Well, past experience. One time there was one-lane highways. Then there was two. Then three. What happens? Lands values go up. Pressures grow. This is a natural course of events that all of us have witnessed, whether in Southern California, back East or here; here, especially in Sonoma County where I've been since . So well-intended improvements in transportation are going to have outfall, and I believe the mitigation that MTC, that ABAG, that our local representatives will attempt will not be sufficient because they have not been sufficient in the past. That is a concern. In the comment; the equity analysis, EIR alternatives, it the states that "thanks to increased affordable housing production." I am from Guerneville, and I would like to say we had an affordable housing unit, units, put into our area. And one of the reasons given was, it was a necessary allocation from ABAG that Sonoma County have so many, and Guerneville must accept a certain number of units. Now, Guerneville is a long way out of the corridor and the Priority Developments Areas, and yet it will be impacted, as will other outlying areas. It is very, very hard to not have that happen. I would like the Plan to certainly give very good consideration to what will be the impact. Reducing commute times; an important factor. However, it has unintended consequences. I know that your staff, the staff here, everyone, is very, very competent, and the people who spoke before me are knowledgeable. But I don't know if it will suffice because I believe the underlying premise, the paradigm under which it operates, is not doable. Thank you.

ROSA KOIRE:

I'm Rosa Koire. I'm the executive director of the Post Sustainable Institute. One thing that I did notice when I read through the Plan and the EIR was that it looks like you want to bring back redevelopment even though it's been ended in California. You want to bring bank tax increment financing, TIF. And this is really a problem because what it does is it sucks the funds out of the areas that you want to improve for , and years. One other thing I noticed, this Plan is the same plan all across the United States with a major exception. But the Plan is identical to Plan New York, PlanET, PlaniTulsa. It's identical to the Hanoi Center Regional Plan .This is the same Plan all

across the world. You need to take a look at that. And I know you have looked at it because you're elected officials, but the people here, who think they're talking about just the regionalization of the San Francisco Bay Area, are completely uninformed. This Plan is a worldwide plan. This is not some fantasy or a tinfoil hat thing. This is reality. And you need to take a look at it and ask yourself what this is all about. Now, I'd also like to tell you that we will be suing you. Planned Bay Area violates the 14th Amendment of the United States Constitution. You are not paying just compensation for the rights that you'll be taking, that you are taking through this Plan. Priority Development Areas restrict 10 percent of residential development and 10 percent of commercial development to just a few small areas of the Bay Area, about four percent. Okay? And then what about the rest of the 90 percent of the Bay Area? You're violating the 14th Amendment of the United States Constitution, that is the Equal Protection Clause. Development rates will be 10 percent higher; eighty times higher within the PDAs. You're also violating the voter-approved Urban Growth Boundary ordinances. They can only be changed with voter approval. This is a violation. Bay Area Plan Bay Area permanently strips all development rights from rural counties in the nine county Bay Area county. You're effectively taking conservation easements on our rural lands without paying for it. Bay Area Plan Bay Area restricts development rights of property within the Priority Development Areas, too, because you will be limiting development to mixed-use high density smart-growth development. If you use form-based code, then your existing building will be nonconforming, legally nonconforming. One other thing I want to say is that cities are supposedly not supposed to have to comply with this, but that is a lie. If your city wants state or federal transportation dollars over the next years, it will have to comply with Plan Bay Area, and cities have already created Priority Development Areas in compliance with Plan Bay Area. To contribute to this lawsuit, and we hope that you will because this is your only opportunity to stop OneBayArea -- Go to PostSustainabilityInstitute.org and make your checks payable to Post Sustainability Institute. They will go for a legal fund that will only be used to stop OneBayArea. Thank you.

JENNY BARD:

Thank you so much for allowing us to comment on the OneBayArea Plan. I am a enthusiastic supporter of the OneBayArea Plan. I support regional planning. I, too, want to echo the comments made by many of the previous speakers; David Grabill, Denny Rosatti, Ann Hancock, Steve Birdlebough, Ginny Doyle and others. Greenhouse gasses are continuing to arise. Regional planning is critical to reducing the public health burden and costs of a car-dependent society; sprawl. This comes from transportive-related air pollution and lack of safe and abiding alternatives to driving. Communities designed around cars and driving are responsible for the traffic pollution and congestion, which contributes to global warming. And this also limits opportunities for healthy, active lifestyles such as walking and cycling; and providing opportunities for our seniors to age in place and not be relying on driving. So the OneBayArea Plan begins to address this. I want to urge you to do more. I think the Plan could do more.

E8-C1 There are elements from the Equity, Environment and Jobs Alternative that actually increases investments in active transportation and alternative transportation. There are -- this scenario actually performs the best of all the scenarios, and having a little more information about those plans at these public hearings I think would be very important. Let's see. I'd also like to see a little bit more specificity in the breakdown of expenditures on bicycle and pedestrian infrastructure because it was not really evident on the pie charts and as well as the -- what percentage of all the investments are going to increase bicycle and pedestrians usage and what policies will lead to what percentage of trips by bicycles and pedestrians, too. That would be helpful to know. Thank you.

3.11 Oral Testimony at Plan Hearings

This section contains responses to oral comments on the EIR made at public hearings on the Draft Plan Bay Area. Responses to comments are limited to those comments that were related to the Draft EIR.

A public hearing was held on the Draft Plan in each of the nine counties covered by the Plan and EIR. The subsections below separate the responses by county; there is no subsection for Napa County as no oral testimony was submitted on the EIR at that hearing.

E1: ALAMEDA COUNTY PUBLIC HEARING ON THE PLAN (FREMONT, 5/1/13)

E1-A Clarissa Cabansagan

E1-A1: MTC and ABAG acknowledge that the Environment, Equity and Jobs scenario was modeled to reflect increased transit operations funding, reduced funding for expansion of the highway network, increased affordable housing, and anti-displacement measures.

E1-B Myesha Williams

E1-B1: Commenter's support for Alternative 5 is acknowledged.

E1-C Pamela Tapia

E1-C1: Commenter's support for the transit, affordable housing, and other measures in Alternative 5 is acknowledged.

E1-C2: See Master Response F regarding displacement.

E1-D Devilla Ervin

E1-D1: Commenter's support for the transit, affordable housing, and anti-displacement measures in Alternative 5 is acknowledged. Commenter's request to incorporate measures as proposed in Alternative 5 will be considered by decision-makers as part of the EIR certification process and action on the proposed Plan.

E2: CONTRA COSTA COUNTY PUBLIC HEARING ON THE PLAN (WALNUT CREEK, 4/22/13)

E2-A Avon Wilson

E2-A1: See Master Response C regarding the request to extend the public comment period.

E2-B Daniel Debusschere

E2-B1: The issues raised—quality of life, housing preferences, and stakeholder involvement—were taken into account as part of the planning process.

As the comment correctly notes, PDAs are locally nominated and local jurisdictions select a place type for each PDA. See Master Response I regarding the PDA process. The Draft Plan does not require changes to local zoning or land uses; this is done at the local jurisdiction level. Transportation expenditures identified in the Draft Plan also do not require changes to local zoning and land uses,

which are again made by local jurisdictions. Please see Master Response A.1 regarding local control over land use.

E2-C Kathleen Jenkins

E2-C1: This comment does not raise environmental issues that require a response under CEQA.

E2-C2: This comment indicates that “your plan and Draft EIR concedes that past decision by residents and current preference in survey responses indicate that 60 to 70 percent of all new homes are requested to be stack-and-pack.” The Draft EIR does not include reference to a survey of housing preferences. This comment does not raise environmental issues that require a response under CEQA.

E2-D Heather Pruett

E2-D1: See Master Response C regarding the request to extend the public comment period.

E2-D2: See Master Response B.1 regarding the population projections.

E2-E John Doe

E2-E1: This comment about placing Plan Bay Area on the ballot concerns the process for approval of Plan Bay Area itself, not the Draft EIR, which provides environmental review of that Plan. This comment does not raise environmental issues that require a response under CEQA.

E2-E2: MTC and ABAG respectfully disagree with the comment. Page 2.3-5 of the Draft EIR explains that ABAG projections, independent of the proposed Plan, foresee shifts in housing demand by 2040 that would result in single-family homes being demanded by 39 percent of households in the region, down from 56 percent in 2010. If that projection holds true, then the region already has more single-family home supply than will be in demand in 2040, but that page also notes that “[a]lthough this suggests no demand for newly constructed single-family homes, some production will likely occur as the Bay Area housing market adjusts to these trends.” See Master Response B.1 for more information on the population projections. Cost estimates are beyond the scope of CEQA and therefore will not be included in the EIR.

This comment states that “Plan Bay Area requires 80 percent of all new houses to be stack-and-pack.” The Draft Plan does not require any changes with respect to the type or location of new housing in the region. Pursuant to SB375, local jurisdictions retain control of land use decisions. See Master Response A.1 regarding local land use control.

The comment also states that “SB 375 requires unfunded mandates on counties and cities to be identified.” This is incorrect, and even if SB 375 contained that requirement, it would not be included in this EIR. As a result, a cost estimate is not included as part of the Draft EIR.

E2-E3: This comment does not raise specific environmental issues that require a response under CEQA. The potential impact of Plan Bay Area on the provision of public services was analyzed in Chapter 2.14 of the Draft EIR. School, police, and fire protection services are typically funded and administered by local jurisdictions.

E2-E4: This comment does not raise environmental issues that require a response under CEQA.

E2-E5: This EIR evaluates Plan Bay Area as a single, regional project and assesses its impacts at a regional level across all nine counties, which is consistent with CEQA provisions regarding program EIRs. The individual projects that may result from the Plan - transportation improvements and land use development - will require their own individual environmental analyses. A county-level evaluation of the proposed Plan and its impacts would be at a greater level of detail than required. Impacts have been assessed at a regional level and a conceptual localized level. County level information has been provided in the EIR when feasible. See Master Response A.3 regarding the level of specificity in the EIR.

E2-F Rusty Snow

E2-F1: See Master Response A.1 regarding local control over land use. The remainder of this comment about placing Plan Bay Area on the ballot concerns the process for approval of Plan Bay Area itself, not the Draft EIR, which provides environmental review of that Plan. This comment does not raise environmental issues that require a response under CEQA. Please note that the MTC and ABAG Board consist of elected representatives from many counties and cities of the region and their decisions reflect the decisions of these voter-selected officials.

E2-F2: See Master Response C regarding the request to extend the public comment period.

E2-F3: The Plan proposes a land use development pattern based on PDAs voluntarily designated by local jurisdictions. See Master Response I regarding the PDA process. While the Plan proposes this land pattern, neither MTC nor ABAG has local land use authority and implementation of the Plan is up to local jurisdictions. Please see Master Response A.1 for additional information regarding local control of land uses. In addition, see Chapter 2.6 of the Draft EIR regarding noise impacts, Chapter 2.3 regarding disruption to existing neighborhoods, and Chapter 2.10 regarding significant contrasts with the visual character of existing communities.

E2-F4: This comment does not raise environmental issues that require a response under CEQA.

E2-G Peter Singleton

E2-G1: See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. MTC and ABAG followed CEQA requirements for public noticing of the EIR. Please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR.

E2-H Terry Thompson

E2-H1: The Draft EIR contained a thorough analysis of environmental issues associated with the Plan, hence its length.

E2-H2: Commenter's support for the No Project Alternative is acknowledged. See Master Response A.1 regarding local control over land use.

E2-I Susan Callister

E2-I1: Please see Master Response B.1 for more information on the population projections.

E2-J Chet Martine

E2-J1: This comment does not raise environmental issues that require a response under CEQA.

E2-J2: MTC and ABAG have provided for a 45 day public comment period as required under CEQA. See Master Response C regarding the request to extend the public comment period.

E2-J3: Balcony location is just one of many actions listed in Mitigation Measure 2.2(d).

E2-K Linda Delahunt

E2-K1: The Draft EIR contained all of the analysis required under CEQA, hence its length. MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Section 1 of this Final EIR for a description of the public review process for the Draft EIR. See Master Response C regarding the request to extend the public comment period.

E3: MARIN COUNTY PUBLIC HEARING ON THE PLAN (SAN RAFAEL, 4/29/13)

E3-A Ronnie Teyssier

E3-A1: The Draft EIR acknowledges and discusses the potential effects of traffic, air quality, sea level rise, and water availability, in Sections 2.1, 2.2, 2.5, and 2.8, respectively. Commenter's request for changes to the proposed Plan, by removing TamAlmonte from the Highway 101 Corridor Priority Development Area, will be considered by MTC and ABAG prior to taking action on Plan Bay Area. See Master Response I regarding the PDA process.

E3-B Craig Thomas Yates

E3-B1: Commenter's comment about accessibility does not raise environmental issues under CEQA. With regard to wetlands, potential impacts on water quality and biological resources were analyzed in the Draft EIR in Chapter 2.8, Water Resources and Chapter 2.9, Biological Resources, respectively. See Master Response A.3 regarding the level of specificity in the EIR.

E3-C Jesse Shepherd

E3-C1: Commenter's support for Alternative 5: Environment, Equity, and Jobs is acknowledged.

E3-D Ericka Erickson

E3-D1: Commenter's support for Alternative 5: Environment, Equity, and Jobs is acknowledged.

E3-E Cathy Cortez

E3-E1: Commenter's support for Alternative 5: Environment, Equity, and Jobs is acknowledged.

E3-F Lois Riddick

E3-F1: Commenter's support for Alternative 5: Environment, Equity, and Jobs is acknowledged.

E3-G Linda Rames

E3-G1: The Draft EIR (pages 2.8-34 to 2.8-36) acknowledges and discusses the potential impacts of flooding, including impacts resulting from development in flood hazard zones. Furthermore, the Draft EIR recommends implementation of Mitigation Measure 2.8(b) to mitigate those impacts.

E3-G2: See response E3-I1 below.

E3-G3: See response E2-E3.

E3-G4: Please see Master Response B.1 for information regarding population projections.

E3-H Luke Teyssier

E3-H1: Commenter's opposition to Plan Bay Area, and support for the No Project alternative, is acknowledged.

E3-I Peter Hensel

E3-I1: "CEQA should not be understood to require assurances of certainty regarding long-term future water supplies at an early phase of planning for large land development projects." (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 432.) This is because other statutes addressing the coordination of land use and water planning demand that water supplies be identified with more specificity at each step as land use planning and water supply planning move forward from general phases to more specific phases. (*Id.* at pp. 432-434, citing Gov. Code, § 66473.7 and Wat. Code, §§ 10910-10912.)

The Plan Bay Area Draft EIR does not in any way change requirements for future development projects to undertake Water Supply Assessment Plans. As discussed under Impact 2.12-1, the Urban Water Management Plans (UWMPs) for the major water suppliers of the region indicate adequate water supplies for the amount of projected growth at a regional level. This amount of population growth and development projected for the region will occur regardless of the proposed Plan and would be the actual cause of any impacts from expansions of water supply - these impacts will occur with or without Plan Bay Area, as shown in Chapter 3.1 of the Draft EIR. In the case of a localized water shortage caused by the distribution of growth under the proposed Plan, mitigation measures 2.12(a) through (h) would reduce the impact to less than significant, if applied by the implementing agency. Also see Master Response G for additional information regarding water supply.

E3-J Linda Pfeifer

E3-J1: See response E3-I1.

E3-J2: Potential impacts of Plan Bay Area on traffic congestion, air quality, and biological resources (including habitat for threatened and endangered species) are acknowledged and discussed in Chapters 2.1, 2.2, and 2.9 of the Draft EIR respectively.

E3-J3: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Chapter 1 of this Final EIR

for a description of the public review process for the Draft EIR. See Master Response C regarding the request to extend the public comment period.

- E3-J4: The proposed Plan includes transportation investments and programs that will work with the proposed land use pattern in order to reach the SB 375 GHG emissions reductions targets.

E3-K Robert Bundy

- E3-K1: The Draft EIR addresses sea level rise within the Climate Change and Greenhouse Gases Chapter, and identifies a number of mitigation measures and adaptation strategies that may reduce project-specific sea level rise impacts to a less than significant level. However, because (1) MTC and ABAG cannot require local implementing agencies to adopt the mitigation measures proposed in the Draft EIR, and (2) site-specific or project-specific conditions may preclude adoption of the mitigation measures proposed in the Draft EIR for at least some future land use development projects, the Draft EIR concludes sea level rise impacts may be significant and unavoidable. (Draft EIR, pp. 2.5-68, 2.5-71, 2.5-76.) Please see Master Response E for additional information regarding sea level rise.

E3-L Liz Specht

- E3-L1: See response E3-I1 regarding regional water impacts. In addition, the decision to use desalination as a water source would be solely the decision of the Marin Municipal Water District (MMWD) and is not advocated for or required by the proposed Plan. The current MMWD Urban Water Management Plan indicates adequate water supplies through the year 2035 without a need to resort to desalination. The proposed Plan would result in essentially the same year 2040 population as under the No Project alternative - a three percent increase, with the proposed Plan resulting in 500 more households in Marin County than under the No Project scenario. Given the water supplies indicated by MMWD, it is extremely unlikely that additional water supplies will need to be acquired due to growth under the proposed Plan. In brief, the proposed Plan does not require the use of desalination and hence the responsibility for impacts from the pursuit of that option would fall on MMWD, not MTC or ABAG. Furthermore, the Draft EIR does not propose the use of desalination as part of its mitigation strategy.

E3-M John Palmer

- E3-M1: See response E3-J3.

- E3-M2: The connection between higher-density development near transit and reduced greenhouse gas emissions is based on the way increased housing density affects automobile vehicle miles traveled and public transit utilization, and the importance of having a land use strategy that augments technological strategies for reducing emissions. Please see Master Response D.2 for additional information regarding the connection between high-density housing near transit and reduced greenhouse gas emissions.

E3-N Guy Meyer

- E3-N1: Please refer to Master Response G for a detailed description of water supply required in an EIR. Per the Marin Municipal Water District's (MMWD) 2010 Urban Water Management Plan (UWMP) Section 3.3, the District has coordinated its future water demands through 2035 with the Sonoma County Water Agency (SCWA) and SCWA's UWMP. MMWD has a contracted volume of up to 14,300 acre-feet per year with SCWA, but per its UWMP only anticipates needing 8,500 acre-feet per year from this contracted volume in 2035.

E3-N2: The Draft EIR acknowledges and discusses the potential effect of Plan Bay Area on sensitive receptors (including residential uses) located in Transit Priority Project corridors with high concentrations of toxic air contaminants and particulate matter (pages 2.2-36 to 2.2-40). The Draft EIR concludes that future projects locating sensitive receptors in areas mapped above the significance thresholds would result in potentially significant and unavoidable impacts. See Response to Comment B25-8 and B25-10 regarding air quality impacts on human health and the need for site-specific analyses when sensitive land uses are proposed in areas that are disproportionately impacted. See also Master Response A.3 regarding level of specificity in the EIR.

E3-O Richard Hall

E3-O1: Contrary to the comment that CO₂ emissions would increase as a result of the proposed Plan, the analysis documented in Draft EIR Chapter 2.5 determined that the proposed Plan would reduce GHG emissions.

E3-O2: Transportation impacts were fully analyzed in Chapter 2.1 of the Draft EIR at a regional rather than local level, as were all impacts. See Master Response A.3 regarding level of specificity in the EIR.

E3-O3: MTC and ABAG acknowledge that the proposed Plan is projected to reduce annual total greenhouse gas emissions by 15 percent compared to 12 percent under the No Project alternative, as shown in Table 3.1-29 of the Draft EIR (p. 3.1-61). However, Table 3.1-28 of the Draft EIR (p.3.1-59) shows that the proposed Plan (Alternative 2) would reduce GHG emissions from cars and light trucks by 18.0 percent in 2040 compared to 2005 levels, while the No Project alternative (Alternative 1) would have a 7.7 percent reduction, far short of the SB 375-mandated target for the RTP/SCS.

E3-O4: Regarding the first two points, see Master Response D.2 on the connection between high-density housing near transit and reduced greenhouse gas emissions. The comment on cost is beyond the scope of an environmental impact analysis under CEQA.

E3-O5: See Master Response D.2 regarding transit emissions as compared with personal vehicle emissions per passenger mile.

E3-P Toni Shroyer

E3-P1: See response E2-E3.

E3-Q Frank Egger

E3-Q1: The Draft EIR (pages 2.12-50 to 2.12-52) analyzes the potential for Plan Bay Area to result in inadequate wastewater treatment capacity to serve new development. Mitigation measure 2.12(d) includes the following stipulation: “Undertaking environmental assessments of land use plans and developments to determine whether sufficient wastewater treatment capacity exists for a proposed project. These environmental assessments must ensure that the proposed development can be served by its existing or planned treatment capacity, and that the applicable NPDES permit does not include a Cease and Desist Order or any limitations on existing or future treatment capacity. If adequate capacity does not exist, the implementing agency must either adopt mitigation measures or consider not proceeding with the project as proposed.”

As long as the local jurisdiction(s) implement this recommended mitigation measure, the impact would be less than significant since development should not be approved until the Ross Valley Sanitary District improves its capacity. MTC AND ABAG assume that the District will need to

expand its capacity during the life of the proposed Plan in order to serve existing and projected users, in line with NPDES permitting requirements, and so at some point before 2040 the proposed land use pattern could be developed.

E3-R Kerry Stoebner

E3-R1: See response E3-I1 regarding regional water impacts and E3-L1 regarding desalination.

E3-S Ray Day

E3-S1: Commenter's support for the No Project alternative is acknowledged.

E3-S2: The MTC and ABAG Board consist of elected representatives from many counties and cities of the region and their decisions reflect the decisions of these voter-selected officials. See Master Response C regarding the request to extend the public comment period.

E3-T James Bitter

E3-T1: The Draft EIR contained a thorough analysis of the environmental impacts associated with the Plan, hence its length.

E3-U Sue Hestor

E3-U1: The Draft EIR acknowledges and discusses the potential for Plan Bay Area to have adverse environmental effects with regard to liquefaction as a result of seismic activity (pp. 2.7-26 to 2.7-28); and development in flood hazard areas (pp. 2.8-34 to 2.8-36).

E3-U2: The comment on affordable housing is on the proposed Plan and beyond the scope of CEQA as it regards an economic rather than physical impact. See Master Response F on displacement, which includes an explanation of additional initiatives that MTC and ABAG are implementing to "incentivize community stabilization and minimize existing and future displacement pressures on low-income households."

The Draft EIR acknowledges and discusses the potential for Plan Bay Area to have adverse environmental effects with regard to placing transportation facilities, housing, and other land uses in areas potentially susceptible to sea level rise (pp. 2.5-62 to 2.5-86). Please see Master Response E for additional information regarding sea level rise.

E3-V Helen Lindquist

E3-V1: The Draft EIR acknowledges and discusses the potential impacts on biological resources (pp. 2.9-56 to 2.9-80), including discussion of potential impacts on riparian areas and wetlands. The Draft EIR also discusses the potential for increased runoff or flooding and development in flood hazard areas (pp. 2.8-32 to 2.8-39).

E3-V2: Regardless of any differences of opinion on the causes and existence of climate change, Plan Bay Area is required to adhere to the GHG emissions reduction targets established by SB 375. Please see Master Response D.1 on the greenhouse gas emissions included in analysis for the SB 375 target for more information.

E3-W Sharon Rushton

E3-W1: MTC and ABAG acknowledge that the Draft EIR identifies 39 significant and unavoidable adverse environmental impacts. With limited exceptions, MTC and ABAG cannot require local implementing agencies to adopt specific mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. Moreover, because MTC and ABAG have prepared a program EIR, the EIR does not include city, county, or site-specific environmental analysis. For both of these reasons, MTC and ABAG cannot ensure either that the mitigation measures set forth in this EIR will be feasible for all site-specific projects or that local implementing agencies will exercise their discretion to implement the measures even if feasible. As a result, a large number of impacts identified in this EIR remain potentially significant and unavoidable. However, where MTC and ABAG have determined that successful implementation of the mitigation measures identified in this EIR would reduce a potentially significant and unavoidable impact to a less-than-significant level, the EIR acknowledges this conclusion and discusses the above uncertainties concerning successful implementation of the measures. See Master Responses A.1 and A.3 regarding local control over land use and the level of specificity in the EIR.

It should be noted that the proposed Plan does not promote or create new growth and merely accommodates future population growth already projected to occur within the region. The Draft EIR evaluates five alternatives, including the proposed Plan, and finds that they present numerous tradeoffs in terms of both their potential environmental effects, and their degree of success in achieving Plan Bay Area goals and objectives.

MTC and ABAG may find that the potential significant environmental impacts would be outweighed by other benefits, including having fewer impacts than under a No Project scenario. (CEQA Guidelines Section 15093(a).) In addition, as discussed above, many of the significant and unavoidable impacts occur because MTC and ABAG cannot require local implementing agencies to adopt the mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. Please see Master Response A.1 on local control over land use for additional information. This issue will be also addressed in the Statement of Overriding Considerations that will be submitted with the Final EIR to the MTC and ABAG Board for certification.

E3-X Carol Sheerin

E3-X1: See response E2-K1.

E3-Y Peter Lacques

E3-Y1: Please see Master Response G for additional information regarding water supply.

E3-Y2: Please see Master Response E for additional information regarding sea level rise.

E3-Y3: Housing density plays a critical role in affecting travel demand, regardless of travel mode. By bringing travel origins (typically a place of residence) and destinations (employment, retail, etc.) closer together, travel distances are reduced and non-auto modes become increasingly viable. Please see Master Response D.2 for more information regarding the relationship between affordable (higher-density) housing and reduced greenhouse gas emissions.

In the *Plan Bay Area Draft Performance Assessment Report* published by MTC in March 2013, it was determined that the proposed Plan is expected to increase the share of low-income and lower-middle income residents' household income consumed by transportation and housing by three percent

compared to existing conditions. While this result moves in the opposite direction from the Plan's objective, the proposed Plan would perform better than the No Project alternative, which is estimated by the same Report to increase this metric by eight percent. In other words, the proposed Plan provides a beneficial rather than deleterious impact on this issue in comparison to the No Project alternative.

E3-Z Ann Spake

E3-Z1: See response E3-W1. Also, the comment is correct to state that the Draft EIR addresses the effects of the proposed Plan on the environment, but is not required to analyze the potential effects of the environment on the Project.

E3-AA Margaret Zegart

E3-AA1: MTC and ABAG respectfully disagree with the comment that "250 percent of the new housing is going to be on floodplain." Besides being mathematically impossible, this conflicts with the analysis in Chapter 2.8 of the Draft EIR, specifically Impact 2.8-7. See Appendix G of the Draft EIR for a list of areas within PDAs that have been mapped as being in the 100-year flood hazard zone.

E4: SAN FRANCISCO PUBLIC HEARING ON THE PLAN (SAN FRANCISCO, 4/11/13)

E4-A Steve Woo

E4-A1: The Draft EIR acknowledges and discusses the potential for the proposed Plan to result in community disruption and displacement in Section 2.3, as noted by the commenter. The comments addressing potential displacement predominantly raise socio-economic policy issues that are beyond the scope of this EIR, rather than environmental issues that require a response under CEQA. Please see Master Response F for additional information regarding displacement.

In addition, Draft EIR Chapter 1.1 (p.1.1-13) notes that, "Projects that use the SB 375 CEQA streamlining benefits will still need to obtain discretionary permits or other approvals from the lead agency and the local jurisdiction, in accordance with local codes and procedures, including any agreements related to zoning, design review, use permits, and other local code requirements." These permits and other requirements would include any local measures addressing displacement and affordable housing, such as impact fees and inclusionary housing.

E4-B Joel Ramos

E4-B1: Commenter's support for Alternative 5: Environment, Equity, and Jobs, is acknowledged. Your request will be considered by decision-makers as part of the EIR certification process and action on the proposed Plan.

E4-B2: As the comment notes, in the Plan Bay Area Draft Performance Assessment Report published by MTC in March 2013, it was determined that the proposed Plan is expected to increase the share of low-income and lower-middle income residents' household income consumed by transportation and housing by three percent. While this result moves in the opposite direction from the Plan's objective, the proposed Plan would perform better than the No Project alternative, which is estimated by the same Report to increase this metric by eight percent. In other words, the proposed Plan provides a beneficial rather than deleterious impact on this issue, relative to the No Project alternative. In addition, this is not a significance criterion of the EIR and thus this comment does not raise any issues that require a response under CEQA.

E4-B3 Commenter argues that displacement will lead to sprawl and conversion of farmland to residential uses. The proposed Plan is designed to ensure that the proportion of in-commuting from outside the region will not increase as the population grows. Furthermore, the compact land use growth pattern under the proposed Plan limits development on agricultural and open space lands to a much greater extent than the No Project alternative. As such, the project has a beneficial impact on this issue relative to the No Project alternative.

E4-B4 Commenter's request for changes to the proposed Plan (to convert freeway lanes into HOV toll lanes and to use the resulting revenue in support of transit) will be considered by MTC and ABAG prior to taking action on Plan Bay Area.

E4-C Peter Cohen

E4-C1: See response E4-A1.

E4-D Kate White

E4-D1: Commenter's support for Alternative 5: Environment, Equity, and Jobs, is acknowledged.

E4-E Starchild

E4-E1: Commenter's opposition to the proposed Plan is acknowledged. Regarding public comment opportunities on the EIR, see response E2-K1. The EIR for Plan Bay Area has been prepared in compliance with CEQA.

E5: SAN MATEO COUNTY PUBLIC HEARING ON THE PLAN (FOSTER CITY, 4/29/13)

E5-A Jeff Hobson

E5-A1: Commenter's support for Alternative 5: Environment, Equity, and Jobs, is acknowledged.

E5-B Bob Cohen

E5-B1: The Draft EIR analyzes the potential impacts of sea level rise regardless of the cause. Please see Master Response E for additional information regarding sea level rise.

E5-C Gail Raabe

E5-C1: The Draft EIR acknowledges and discusses the proposed Plan's potential environmental effects on open space in Section 2.3: Land Use, and discusses the potential effects on biological resources in Section 2.9: Biology. These sections cover issues raised by the commenter regarding the open space and biological resource values provided by areas such as salt ponds and marshes. The Draft EIR (Section 2.3) provides a range of mitigation measures to minimize impacts on open space and farmland, including farmland with Williamson Act contracts. Other mitigation measures (in Section 2.9) seek to minimize potential effects on special status species, including indirectly through habitat destruction. To the extent that an individual project adopts all feasible mitigation measures, these impacts would be less than significant, absent site-specific conditions that would require additional analysis. However, because MTC and ABAG cannot require local implementing agencies to adopt the mitigation measures in all cases (i.e., where projects are not tied to funding), it cannot be ensured that this mitigation would be implemented in all cases. Therefore, this impact remains significant and unavoidable on a regional basis. In addition, as the commenter implicitly notes, open space conservation is beyond the authority of MTC and ABAG and rather is a responsibility for local land

use authorities. Please see Master Response A.1 for more information regarding local control over land use.

E5-D Joshua Hugg

E5-D1: Commenter's support for Alternative 5 is acknowledged.

E5-E William Nack

E5-E1: Issues of wages and labor standards fall beyond the scope of the EIR. CEQA only requires analysis and mitigation of potentially substantial adverse changes in the physical environment.

E6: SANTA CLARA COUNTY PUBLIC HEARING ON THE PLAN (SAN JOSE, 5/1/13)

E6-A Susan Stuart

E6-A1: See Master Response F regarding displacement. The comments regarding cost of living and collisions relate to project objectives adopted by MTC and ABAG but which are not criteria of significance for the EIR and fall beyond the issues covered by CEQA.

E6-A2: Commenter's support for Alternative 5: Environment, Equity, and Jobs, is acknowledged.

E6-B Chris Lepe

E6-B1: Commenter's qualified support for the proposed Plan is acknowledged.

E6-B2: Commenter's request for changes to the proposed Plan (revenues from HOT lanes going toward better public transportation options rather than highway expansion and more funding for transit operations) will be considered by MTC and ABAG prior to taking action on Plan Bay Area.

E6-B3: See Master Response F regarding displacement and an explanation of additional initiatives that MTC and ABAG are implementing to "incentivize community stabilization and minimize existing and future displacement pressures on low-income households."

E6-B4: Commenter's support for Alternative 5 is acknowledged.

E6-C Susan M

E6-C1: See Master Response B.1 for information regarding population projections.

E6-C2: The MTC and ABAG Board consist of elected representatives from many counties and cities of the region and their decisions reflect the decisions of these voter-selected officials. However, land use decisions will still be the responsibility of local jurisdictions. Plan Bay Area merely proposes a land use development pattern and provides incentives to localities in order to reach GHG emissions reduction targets mandated under SB 375. MTC and ABAG do not have local land use authority. See Master Response A.1 regarding local control over land use.

E6-D Susan Russell

E6-D1: Commenter's support for Alternative 5 is acknowledged. Commenter's request for changes to the proposed Plan to incorporate elements from this alternative will be considered by MTC and ABAG prior to taking action on Plan Bay Area.

E6-E Libby Lucas

E6-E1: The Draft EIR discusses potential impacts on wetlands in Chapter 2.9 on pages 2.9-66 to 73 and proposes Mitigation Measure 2.9(d), which would normally reduce impacts on wetlands to a less-than-significant level, although the Draft EIR acknowledges that, “there may be instances in which site-specific or project-specific conditions preclude the reduction of all project impacts to less than significant levels.” (Draft EIR, p.2.9-72) In addition, “MTC/ABAG cannot require local implementing agencies to adopt the above mitigation measures, and it is ultimately the responsibility of a lead agency to determine and adopt mitigation. Therefore it cannot be ensured that this mitigation measure would be implemented in all cases.” (Draft EIR, p.2.9-73)

E6-E2: The Draft EIR analyzes potential impacts of the proposed Plan on public services such as schools and parks in Chapter 2.14: Public Services.

E6-F Cat Nguyen

E6-F1: Commenter’s support for Alternative 5 is acknowledged. The comment on affordable housing is on the proposed Plan and beyond the scope of CEQA as it regards an economic rather than physical impact. See Master Response F on displacement, which includes an explanation of additional initiatives that MTC and ABAG are implementing to “incentivize community stabilization and minimize existing and future displacement pressures on low-income households.”

E6-G Michael Dittmer

E6-G1: Commenter’s support for Alternative 5 is acknowledged.

E6-G2: Commenter’s request that HOT lane revenue be invested in public transit will be considered by MTC and ABAG prior to taking action on Plan Bay Area.

E6-G3: See Master Response F regarding displacement.

E6-H Cecilia Ng

E6-H1: Commenter’s support for Alternative 5: Environment, Equity, and Jobs, is acknowledged. Your suggestions regarding the use of HOT lanes, desire for more funding of transit operations, and protection against displacement will be considered by decision-makers as part of the EIR certification process and action on the proposed Plan.

E6-I Mounia O’Neal

E6-I1: Commenter’s support for Alternative 5: Environment, Equity, and Jobs, is acknowledged.

E6-J Anaruth Hernandez

E6-J1: Commenter’s support for Alternative 5: Environment, Equity, and Jobs, is acknowledged.

E6-K Brian Darrow

E6-K1: Commenter’s qualified support for the proposed Plan is acknowledged.

E6-K2: Commenter’s request for stronger anti-displacement and affordable housing policies through the OBAG program will be considered by MTC and ABAG prior to taking action on Plan Bay Area.

E6-K3: Commenter's request to prioritize transit operations with future unrestricted funds, ensure that the HOT lane network mitigates the potential impacts on low-income commuters, and not building new freeways will be considered by MTC and ABAG prior to taking action on Plan Bay Area.

E6-K4: See response E5-E1.

E6-L Susan Marsland

E6-L1: Commenter's request for changes to the proposed Plan to include policies from Alternative 5 will be considered by decision-makers as part of the EIR certification process and action on the proposed Plan.

E6-M Jean Ryan

E6-M1: Commenter's opposition to a vehicle miles travelled (VMT) tax is acknowledged. No VMT tax would be imposed as part of the proposed Plan, but it is part of Alternative 5 and would be a possibility if that option was selected. Decision-makers will weigh the advantages and disadvantages of each alternative in determining which option to adopt.

E7: SOLANO COUNTY PUBLIC HEARING ON THE PLAN (VALLEJO, 4/22/13)

E7-A Bob Berman

E7-A1: Please refer to Chapter 2.9 of the Draft EIR for an analysis of impacts on biological resources, which includes Mitigation Measure 2.9(g) that calls for individual projects pursued under the proposed Plan to ensure the maximum feasible level of consistency with the policies in adopted HCPs, NCCPs, or other approved local, regional, or state conservation plans, in areas where such plans are applicable. The Draft EIR notes that this measure is tied to existing regulations that are law and binding on responsible agencies and project sponsors. Your request to direct more OBAG funding to Priority Conservation Areas will be considered by decision-makers as part of the EIR certification process and action on the proposed Plan.

E7-A2: Please refer to Chapter 2.3 of the Draft EIR for an analysis of impacts on agricultural lands, which includes Mitigation Measures 2.3(g) and (h), which would be requested of implementing agencies and project sponsors by MTC and ABAG and would exist in addition to policies in the proposed Plan.

E7-A3: Please refer to Chapter 2.14 of the Draft EIR for an analysis of impacts on public services, including park and recreation facilities. The Draft EIR notes that under the proposed Plan investment in multi-modal transportation projects "has the potential to improve access to existing neighborhood and regional parks" (p. 2.14-16). As a program-level EIR, specific transportation improvements providing access to local and regional parks have not yet been identified. MTC and ABAG cannot ensure long-term protection of parks and open space because local governments retain authority over land use decisions. However, the Draft EIR recommends implementation of Mitigation Measure 2.14(b) to ensure sufficient park land is available. See Master Responses A.1 and A.3 regarding local control over land use planning and the level of specificity in the EIR.

E8: SONOMA COUNTY PUBLIC HEARING ON THE PLAN (SANTA ROSA, 4/8/13)

E8-A Lloyd Guccione

E8-A1: MTC and ABAG believe that the mitigation measures proposed in the EIR will reduce potentially significant impacts, usually to a less than significant level. Many of these mitigation measures are

based on applying current best practices employed in California, such as those to reduce impacts on biological resources and water quality, to land development and transportation projects that normally may follow these guidelines but are not required to do so. The Draft EIR does specifically state that some impacts will remain significant even with mitigation; it does not pretend there will be no environmental impacts. Furthermore, many other mitigation measures emphasize the importance of context with respect to their efficacy. Some measures that are effective for a project in one location will not be effective for a similar project on a different site. See Master Responses A.1 and A.3 regarding local control over land use planning and the level of specificity in the EIR.

E8-A2: As stated in Chapter 2.0 of the Draft EIR, “as a program-level EIR individual project impacts are not addressed in detail; the focus of this analysis is to address the impacts which, individually or in the aggregate, may be regionally significant...This approach does not relieve local jurisdictions of the responsibility for evaluating project-specific, locally significant impacts.” See Master Responses A.1 and A.3 regarding local control over land use planning and the level of specificity in the EIR.

E8-B Rosa Koire

E8-B1: This comment does not raise environmental issues that require a response under CEQA.

E8-B2 Please see Master Response A.1 about local control over land use.

E8-C Jenny Bard

E8-C1: Commenter’s support for Alternative 5 is acknowledged.

E8-C2: Commenter requested more specific information about proportion of funds going toward bicycle and pedestrian infrastructure and anticipated impact on mode choice. State Transportation Development Act (TDA) and local sales tax funds committed to bicycle and pedestrian improvements total \$4.6 billion during the Plan period. The One Bay Area Grant program, \$14.6 billion over the life of the Plan, is another fund source that can be used to pay for 'Complete Streets' projects. These projects can include stand-alone bicycle and pedestrian paths, bicycle lanes, pedestrian bulb-outs, lighting, new sidewalks, Safe Routes to Transit, and Safe Routes to Schools projects that will improve bicycle and pedestrian safety and travel.

In addition to this funding, cities and counties that wish to use OBAG grant funds must adopt a 'Complete Streets' resolution and in the future an updated general plan element to improve the delivery of Complete Streets projects serving all road users, including pedestrians and bicyclists. During MTC's last survey of project sponsors in 2006, over 55% of transportation projects surveyed already included complete streets elements. The resolution requirement is expected to increase the rate of complete street implementation

See Master Response A.3 regarding local control over land use planning.

3.12 Written Comments Submitted at Public Hearings and Responses

Plan Bay Area 2040 Final Environmental Impact Report

	A	B	C	D	E	F	G
	Number	Source	Name	Comment	Category (as assigned by staff)	Comment Applies to Which Draft: (as indicated by the commentator)	E-mail provided by the commentator
1		Alameda written	Alameda County	Waste of taxpayer money. Top down central planning. Leave control with cities. No Plan.	PBA: Does not support the plan; a waste of money	Draft Plan Bay Area; Draft EIR; Draft TIP & AQ Conformity	
2	F-A1	CCC written	Marita Platon (#1)	All your assumptions are based on erroneous data. There are more economical ways to help the environment without vested interest benefiting from these ways.	Data: flawed assumptions	Draft EIR	maritaplanton@yahoo.com
3	F-B1	CCC written	Mike Garrabrants	The OneBayArea plan is deeply flawed. 1. It is based on a flawed presumption that to be "one", we need to have all regions be homogenous and occupied with high-density transit villages. This flawed assumption arises from the failed government philosophy that the government knows more about what people want than the people, or perhaps worse, the government seeks to impose its will through "strong arm" tactics. Practically, these plans are flawed because they are based on flawed assumptions. California is shrinking and will continue to do so.	Data: flawed assumptions and thus thinks govt. using strong arm tactics	Draft Plan Bay Area; Draft EIR; Draft TIP & AQ Conformity	MSGPUBLIC-EC@yahoo.com
4	F-C1						
5	F-C2	CCC written		Told us that the officers who are elected officials are deciding what will happen to their cities with the consent of the people living in their cities. Why is this being imposed on us? Why not put these on the ballot box and see what the majority of the residents want for their city?	Local Control	Draft Plan Bay Area; Draft EIR; Draft TIP & AQ Conformity	
		CCC written	Eric Strattmann, Contra Costa County	I just found out about this plan 1 month ago and most people I talk to in my community of Orinda have never heard of it. Actually, I have yet to meet a single person who knows about this. Changes are being pushed upon our local communities without any opportunity for people to have an appropriate say. This should be put to a vote city by city. This will irreversibly damage the unique character of my city, my property value, schools. At the very least 6 months should be allowed (not 45 days) for the public to weigh in.	Local control; longer public comment period	Draft Plan Bay Area; Draft EIR	
6	F-D1						
		CCC written	Colleen O'Connell, Contra Costa County	The EIR and OneBayArea plan are based on flawed set of data. California has a shrinking population, not a growing population. The supposed need for every community to absorb ultra affordable housing in packed-in 4 story buildings is therefore greatly overstated. The imposition of these projects on the remaining productive taxpayers in California will only hasten the exodus under way.	LU: Suburban Communities can't absorb affordable packed multi-story buldgs.	Draft Plan Bay Area; Draft EIR	
7	F-E1						
		CCC written	Jewilia Eisenberg, Alameda County	Thank you for thinking regionally! We can't solve our housing or transportation issues without working together for a more sustainable future.	PBA: Supports regional planning	Draft Plan Bay Area; Draft EIR	Jewilia@CharmingHostess.com
8	F-F1						
		CCC written	Janet Maiorana, Contra Costa County (#1)	1. Citizens need more time to analyze the Plan and draft EIR. Ninety days would be appropriate.	Process: longer review period	[blank]	vjinjmm@comcast.net
9	F-G1						
		DEIR Hearing Marin written	Pam Drew, Marin County	You have not adequately dealt with 1) water supplies for increased population; 2) endangered species and Bay wet lands; 3) increased local traffic congestion and air pollution; 4) improper projections artificially inflated projections and your refusal to correct these projections; 5) densification being improper for the land form: 30 U/A not appropriate for Novato, San Rafael or any of the rest of Marin, aesthetically or other wise.	EIR: Water, congestion, improper projections, too much density	Draft EIR	drew.pam@gmail.com
10	F-H1						
		DEIR Hearing Marin written	Ericka Erickson, Marin County (#1)	First, I would like to call attention to the time and place of the public hearings: a public hearing held during a weekday in the morning - and where public transit doesn't reach is not accessible to working families and the ones that are most affected by the plans regarding transit and affordable housing.	Process--prefers evening mtg.	Draft EIR	
11	F-I1						

Plan Bay Area 2040 Final Environmental Impact Report

	A	B	C	D	E	F	G
	Number	Source	Name	Comment	Category (as assigned by staff)	Comment Applies to Which Draft: (as indicated by the commentator)	E-mail provided by the commentator
1					Supports EIR Alt. 5	Draft EIR	
12	F-12	DEIR Hearing Marin written	Ericka Erickson, Marin County (#2)	I would also highlight the fact that the Alternative 5 - EEJ - is the environmentally superior alternative - and most of its aspects should be included in the final plan, especially the elements related to transit and housing (affordable).			
13	F--J1	DEIR Hearing San Jose written	Michael Ludwig Santa Clara County	it's hard for me to judge the overall environmental impact of Plan Bay Area, because I feel some of the projects in it will increase pollution (many of the projects to add new general purpose lanes to roadways will just encourage people to drive more), while some of the other projects in it will decrease pollution (most of the projects that make taking transit easier, such as additional transit lines and/or service hours).	Environment: part of plan will increase pollution and other parts will decrease pollution	Draft EIR	
14	F-K1	DEIR Hearing San Jose written	Ed Mason Santa Clara County	Housing/land use is an unfunded mandate. 5.5% of federal discretionary budget is for housing and community proposed social security payment reduction attempts to balance the budget and I do not want to pay for this. Future housing will be funded by local bonds for below market rate housing.	Taxpayer costs -- does not want to pay for low-income housing	Draft EIR	
15	F-L1	Marin written	Carla Giustino, Marin County	We do not want high density housing in an area that cannot support it, i.e., Marin Civic Center area. This area is not designed for high density housing. The water, traffic was designed for parks and open space by Frank Lloyd Wright and this should stay that way. I am for development but not in this area.	Housing: Opposed to high density housing	Draft Plan Bay Area; Draft EIR; Draft TIP & AQ Conformity	carlarealestate@aol.com
16	F-L2	Marin written		599 of the 852 affordable housing units slated for unincorporated Marin are planned for my District 1. 70% of the new housing units. This will create a huge influx of people and students in our school district. Affordable housing will mostly be exempt from paying property taxes -- leaving us -- our neighborhood -- with the responsibility to shoulder the added cost of this extra 20% increase in population. If the plan is developed it will severely impact our small (Marinwood/Lucas Valley) community. It will increase population and strain our schools. It will also result in displacement -- current and potential new families will leave or won't move in due to these changes. It will increase number of drivers in Marinwood and Lucas Valley and it will create a physical division of our community in the above ways. I am against accepting 70% of the new housing units slated for Marin to be built in our small 2,900 household community for these reasons.	LU/Dev: Opposed to high housing # in unincorporated Marin in District 1 due to congestion, impact on schools	Draft Plan Bay Area; Draft EIR; Draft TIP & AQ Conformity	
17	F-M1	Marin written	Liz Sprecht, Marin County	I am a founder of El Porvenir, a nonprofit organization which works with Nicaraguans to develop clean drinking water projects. For 23 years I have been studying and using facts and figures about potable water. If Plan Bay Area should actually be put into effect, where would the drinking water for all the additional homes come from? If PBA is considering a desal plant, they should realize this would defeat the purpose of the Plan: Increased greenhouse gases would result from any desalinating activity. The net result would be more greenhouse gases.	Other Infrastructure: Water needed for growth; desal plants result in more GHG	Draft EIR	liz@edliz.com
18	F-N1	Napa written	Jack Simonitch Napa County (#2)			Draft Plan Bay Area and Draft EIR	
19	F-O1	Napa written	Nathan Stout, Solano County (#1)	Please make water taxi or vaporetti service a reality from Mare Island on the Napa River. Please make my comment part of the public record.	Transit: Water taxi service from Mare Island on Napa River	Draft Plan Bay Area; Draft EIR; Draft TIP & AQ Conformity	
20	F-O2	Napa written	Nathan Stout, Solano County (#2)	Please extend capability of Napa County Wine Train to reach Mare Island as a new destination and transfer point to the ferry in order to make a possible travel from San Francisco to Napa, which would generate more environmentally friendly tourism. Please make my comment part of the public record.	Transit: Wine Train service to Mare Island	Draft Plan Bay Area; Draft EIR; Draft TIP & AQ Conformity	
21	F-P1	San Mateo written	Sofia Lozano-Paliores	I am a community member interested in getting to know more about the ideas for future development. Great that you are having open houses to discuss this. I however would like to see what projects are ideas and which ones are already funded and development is starting or about to start. I would like to see concrete information or places where I can get it.	General: wants info on projects about to get under construction	Draft Plan Bay Area; Draft EIR; Draft TIP & AQ Conformity	contact@sofialozano.com

Plan Bay Area 2040 Final Environmental Impact Report

	A	B	C	D	E	F	G
	Number	Source	Name	Comment	Category (as assigned by staff)	Comment Applies to Which Draft: (as indicated by the commentator)	E-mail provided by the commentator
1		San Mateo written	Finau Faleofa, San Mateo County	There should be affordable transportation and housing. Transportation locations shouldn't just be in the downtown areas. There should be a schedule change for more transportation instead of just every hour. Santrans should have a better plan for the future instead of [not legible]. There should be more awareness and involvement with the people in each community. The people of the community should be able to be involved in decisions being made. There should be a variety of ethnicities involved in Plan Bay Area organizations, because most communities are made up by other ethnic groups rather than just white. There should be notification of global harmony, recycling, compost and being Go Green.	Housing: Affordable housing & transportation; more diverse people should be involved in Planning	Draft Plan Bay Area; Draft EIR; Draft TIP & AQ Conformity	faleofa650@gmail.com
22	F-Q1	Santa Clara written	Jean Ryan, Santa Clara County	Are you planning on passing a vehicle miles driven tax (VMD)? It is mentioned in your EIR report on one of your proposals. Is this to discourage driving? Sounds like you want to get our cars off the road. Where's the fairness in that? You're hurting the farmers, businesses, and low income people.	Driving: Does not like VMT tax	Draft EIR	fjryan60@yahoo.com
23	F-R1	Santa Clara written	Ed Mason, Santa Clara County	I. Will this plan work? 1) Do not know.	General	Draft Plan Bay Area; Draft EIR	
24	F-S1	Santa Clara written	Ed Mason, Santa Clara County	J. Cost of 2-vol. EIR and Plan. 1) What is the cost of these documents?	General: Cost for Plan & EIR	Draft Plan Bay Area; Draft EIR	
25	F-S2	Santa Clara written	Ed Mason, Santa Clara County	B) Sea Level Rise -- Commute with the Fish. 1) California contributes to 2% of greenhouse gas. 2) Transportation is 39% of greenhouse gas in Bay Area but no breakdown of heavy trucks, airplanes, ships, autos or light trucks. 3) Even if 15% reduction goals are met, what is total cost for small impact on world greenhouse gas.	GHG goal: what is cost for small impact on world GHG	Draft Plan Bay Area; Draft EIR	
26	F-S3	Santa Clara written	Ed Mason, Santa Clara County	3) Treasure Island Ferry -- BTU ratio per passenger mile will be excessive. [part of D from above]	LU/Dev: Treasure Island neighborhood ill conceived.	Draft Plan Bay Area; Draft EIR	
27	F-S4	Santa Clara written	Ed Mason, Santa Clara County	Development for a new San Francisco neighborhood seems ill conceived.	LU: more jobs near freeway exits than train stations	Draft Plan Bay Area; Draft EIR	
28	F-S5	Santa Clara written	Ed Mason, Santa Clara County	C) Plan Mitigates for Auto -- Poor Message to Change Transportation Habit 1) Old Oakland Road is parallel to Highway 880 which was widened over ten years ago. 2) 75% of Bay Area jobs within 1/2 mile of freeway exits and 25% within one half mile of 88 regional train stations or 50% with frequent bus service. 3) Allows PDA development to escape CEQA review, a sweet deal for developers.	Other Infrastructure Needs: unfunded	Draft Plan Bay Area; Draft EIR	
29	F-S6	Santa Clara written	Ed Mason, Santa Clara County	Library hard copy available March 4, 2013 and review period too short for over 2,000 pages of EIR and Draft Plan. A) Unfunded mandate for local general infrastructure such as schools, parks, police, fire and inadequate sewer treatment capacity in San Francisco. 1) Federal discretionary budget may be balanced with reductions to the entitlements budget and my social security. 2) MTC lobby for federal funds for Housing -- which may be reduced. Will MTC lobby for U.S. corporations to pay their fair share of taxes on overseas profits which have not been returned to U.S.. shore.	Seniors: Want to age in place	Draft Plan Bay Area; Draft EIR	
30	F-S7	Santa Clara written	Ed Mason, Santa Clara County	E) Baby Boomers Age in Place: 1) Articles locally written indicate California and San Francisco are not like the rest of the country. 2) Personal experience, round table discussions, etc. indicate seniors desire to age in place at home until an "event" occurs placing them in a care facility. They will not move to the downtown core. Only the few wealthy will move to downtown high rise such as Rincon Tower in San Francisco.	Taxpayer costs: taxpayers don't pay full costs so govt intervenes	Draft Plan Bay Area; Draft EIR	
31	F-S8	Santa Clara written	Ed Mason, Santa Clara County	H. Social Justice: 1) People do not want to pay the full price at a restaurant for the dishwasher to afford housing. Rather government must implement below market rate housing burdening the property owner tax rate. 2) 40% of college graduates work in jobs requiring less qualifications and earning less money to pay off student debt that will qualify for BMR housing.	Transit: ridership has not gone up despite investments	Draft Plan Bay Area; Draft EIR	
32	F-S9	Santa Clara written	Ed Mason, Santa Clara County	[part of H from above] 3) Ohlone-VTA Parking Lot conversion to housing has cars, garages, and has not increased light rail ridership to the projected 40,000 boarding predicted 20 years ago. Current light rail ridership is about 33,000 boardings even with all the expansions.	Transportation: Corporate commuter buses clogging streets	Draft Plan Bay Area; Draft EIR	
33	F-S10	Santa Clara written	Ed Mason, Santa Clara County	D) Transit 1) No mention of corporate commuter buses impacting/ clogging neighborhood streets in San Francisco. 2) 24% of San Francisco trips at 103,431 are outboard trips. ABAG housing requirement being imposed appears to satisfy the "bedroom" commuter to the South Bay and San Mateo County.	Transportation: Not true workers want short commutes	Draft Plan Bay Area; Draft EIR	
34	F-S11	Santa Clara written	Ed Mason, Santa Clara County	F) Short Commutes By Young Workers: 1) The young workers may desire a short commute but their actions indicate otherwise by riding corporate commuter buses for about an hour or more.			

	A	B	C	D	E	F	G
	Number	Source	Name	Comment	Category (as assigned by staff)	Comment Applies to Which Draft: (as indicated by the commentator)	E-mail provided by the commentator
1		SF written	James B. Walsh	Global human over population will be the root cause of the collapse of the planet's entire environment and the extinction of the human race. While planning for the future is all well and good, do recognize that these plans ultimately serve to accommodate more population and enable the ultimate destruction of our world. While this issue may lie beyond the purview of your focus, to not put into place some mitigating policies, to not even mention the over population issue within the context of the Plan, I find to be completely disingenuous in any discussion of our future.	General-- should mention over population	Draft Plan Bay Area; Draft EIR; Draft TIP & AQ Conformity	
35	F-T1			This process is too complicated and not transparent enough. I want to see the names, job titles, job responsibilities, salaries and benefits of all the government personnel working on this plan published online, along with any other costs associated with the planning process, broken down in detail. I want to see advocates of limited government -- libertarians, constitutionalists, Tea Party supporters, etc. -- included in the nuts and bolts of actual planning. I feel we are just being given lip service on a public process that will not really result in the plan being revised based on our concerns.	Process: wants to see all costs and advocates of limited govt. included in planning	Draft Plan Bay Area; Draft EIR; Draft TIP & AQ Conformity	
36	F-T2			I am against the OneBayArea plan. Let the individual citizens determine the actions of their city government. I want my comments to be part of the public record.	Local control; against PBA	Draft Plan Bay Area; Draft EIR; Draft TIP & AQ Conformity	nathanstout@earthlink.net
37	F-U1	Solano written	Nathan Daniel Stout	Need to stabilize, rather than accommodate population. Need language in plan that advocates for a stable population (no growth or loss). ABAG must not be a front for a home building industry.	Population--advocate for zero pop. growth	Draft Plan Bay Area; Draft EIR; Draft TIP & AQ Conformity	
38	F-V1	Solano written	Michael J. Hayes, Solano	Sustainable agriculture, local food production and distribution should be part of this plan. Review and consider signing the Good Food Pledge of the Los Angeles Food Policy Council. This will benefit local nutrition, air quality (less trucking), farm worker safety and rights.	General--address food production in plan	Draft Plan Bay Area and Draft EIR	rdelaware@comcast.net
39	F-W1	Sonoma written	Roger Delaware Sonoma County	More spread-out affordable housing through sustainable affordable transit will bolster the economy across all social strata and ethnic groups, the disabled and people of color and age, as well as support cleaner air, water and physical and mental health. Speed up the Smart Train! And the Bay Area Plan! Three years more of limited transit (after waiting 11 years -- too long -- already). Please note that agencies such as the Post Sustainability Institute are front groups to realtors and developers who will price out the poor who need public transit for work, school, medical care, etc. (not legible) I ride my bike everywhere I can within Sonoma County and take buses through the Bay Area. I have no car and live in dense affordable housing because of my disability.	LU/Dev: More affordable housing with affordable transit will bolster economy	Draft Plan Bay Area; Draft EIR; Draft TIP & AQ Conformity	
40	F-X1	Sonoma-M written	Adam Kirshenbaum				

3.13 Written Comments Testimony at Plan Hearings

This section contains responses to written comments on the Draft EIR submitted at public hearings.

F-A Alameda County Resident

F-A1: This comment does not raise environmental issues under CEQA. See Master Response A.1 about local control over land use. Commenter's support for the No Project alternative is acknowledged.

F-B Marita Platon

F-B1: The EIR for Plan Bay Area has been prepared in compliance with CEQA using the latest information publicly available. Part Two of the Draft EIR extensively explains existing conditions and analysis of impacts with many citations to these data sources. An EIR is required under CEQA and Plan Bay Area is a response to both federal (MAP-21) and State (SB 375) laws, as explained in Chapter 1.2 of the Draft EIR.

F-C Mike Garrabrants

F-C1: MTC AND ABAG respectfully disagree with this comment. Please see Master Response B.1 about the population projections relied upon in the Draft EIR's analysis.

F-C2: As the transportation planning, coordinating, and financing agency for the nine-county San Francisco Bay Area, MTC functions as both the regional transportation planning agency, a state designation, and, for federal purposes, as the region's metropolitan planning organization (MPO). As such, it is responsible for regularly updating the Regional Transportation Plan (RTP) and for screening requests from local agencies for state and federal grants for transportation projects to determine their compatibility with the plan. SB 375 is a new law requiring that the RTP propose a land use pattern supported by the RTP's transportation investments that together will reduce regional GHG emissions to hit targets set by the California Air Resources Board. The MTC and ABAG Board consist of elected representatives from many counties and cities of the region and their decisions reflect the decisions of these voter-selected officials. Please also see Master Response A.1 about local control over land use.

F-D Eric Strattmann

F-D1: MTC AND ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Chapter 1 of this Final EIR for a description of the public review process for the Draft EIR. See Master Response C regarding the request to extend the public comment period. In addition, see response F-C2 for further information on the role of elected officials in developing and adopting Plan Bay Area. Please also refer to Master Response A.1 about local control over land use.

F-E Colleen O’Connell

F-E1: See Master Response B.1 regarding the population projections.

F-F Jewlia Eisenberg

F-F1: Commenter’s support for the proposed Plan is acknowledged.

F-G Janet Maiorana

F-G1: See Master Response C regarding the request to extend the public comment period.

F-H Pam Drew

F-H1: These issues were addressed in the Draft EIR, in Chapters 2.12 (water supply), 2.9 (protected species and wetlands), 2.1 (traffic), and 2.2 (air quality). In addition, see Master Response B.1 regarding the population projections. Chapter 2.10 proposes Mitigation Measures 2.10(a) and (c) to reduce significant contrasts with the scale, form, line, color, and/or overall visual character of the existing community, although local jurisdictions retain land use authority on allowable densities; see Master Response A.1 regarding local control over land use.

F-I Ericka Erickson

F-I1: MTC AND ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Chapter 1 of this Final EIR for a description of the public review process for the Draft EIR.

F-I2: Commenter’s support for Alternative 5 is acknowledged.

F-J Michael Ludwig

F-J1: As stated in Chapter 2.0 of the Draft EIR, “as a program-level EIR individual project impacts are not addressed in detail; the focus of this analysis is to address the impacts which, individually or in the aggregate, may be regionally significant...This approach does not relieve local jurisdictions of the responsibility for evaluating project-specific, locally significant impacts.” Individual projects pursued under the proposed Plan are likely to have a range of adverse and positive environmental effects, which will all be evaluated by the project-level environmental analysis for those projects. For an understanding of how the five alternative growth scenarios compare to one another with respect to their air quality and transportation impacts at the regional level, please see Table 3.1-56 on page 3.1-121 of the Draft EIR.

F-K Ed Mason

F-K1: This comment does not raise environmental issues that require a response under CEQA.

F-L Carla Giustino

F-L1: PDAs were designated by local land use authorities, such as the County of Marin, and were not selected by MTC or ABAG. However, Commenter's request will be considered by decision-makers as part of the EIR certification process and action on the proposed Plan. See Master Response I regarding the PDA process.

F-L2: The proposed Plan does not discuss or allocate the types of housing units and whether or not they are affordable. This is an issue for the local jurisdiction and land developers. See Draft EIR Chapter 2.14 regarding impacts on public services, although the funding and provision of such services are the responsibility of local jurisdictions. See Master Response F regarding displacement. Your opposition to the housing allocated to Marin is noted and your request will be considered by decision-makers as part of the EIR certification process and action on the proposed Plan.

F-M Liz Sprecht

F-M1: See response E3-L1.

F-N Jack Simonitch

F-N1: This comment does not raise environmental issues that require a response under CEQA.

F-O Nathan Stout

F-O1: This comment does not raise environmental issues that require a response under CEQA.

F-O2: This comment does not raise environmental issues that require a response under CEQA.

F-P Sofia Lozano-Pallores

F-P1: Please see Appendix C of the Draft EIR for a list of transportation projects included in the proposed Plan.

F-Q Finau Faleofa

F-Q1: The comment does not raise environmental issues that require a response under CEQA. MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Chapter 1 of this Final EIR for a description of the public review process for the Draft EIR.

F-R Jean Ryan

F-R1: See response E6-M1.

F-S Ed Mason

F-S1: MTC and ABAG believe that the proposed Plan will work as analyzed in the Draft EIR.

- F-S2: This comment does not raise environmental issues that require a response under CEQA.
- F-S3: See Master Response D.1 regarding greenhouse gas emissions included in analysis for SB 375 target. The cost of the proposed Plan is not an environmental issue that requires a response under CEQA.
- F-S4: This comment does not raise environmental issues that require a response under CEQA.
- F-S5: CEQA streamlining is a feature of SB 375 and is beyond the control of MTC and ABAG. See Table 1.1-1 on p.1.1-14 of the Draft EIR and Master Response A.2 for a description of the requirements for CEQA streamlining.
- F-S6: See Master Response C regarding the request to extend the public comment period. Public facilities are typically the responsibility of local jurisdictions and the proposed Plan does not change that; see Chapter 2.14 of the Draft EIR for analysis of impacts on public facilities. See Master Response A.1 and A.3 regarding local control over land use planning and the level of specificity in the EIR. The remainder of the comment does not raise environmental issues that require a response under CEQA.
- F-S7: This comment does not raise environmental issues that require a response under CEQA.
- F-S8: This comment does not raise environmental issues that require a response under CEQA.
- F-S9: This comment does not raise environmental issues that require a response under CEQA. See response to comment C153-9 regarding transit ridership trends relative to investment.
- F-S10: Congestion in San Francisco is a local issue and as stated in Chapter 2.0 of the Draft EIR, “as a program-level EIR individual project impacts are not addressed in detail; the focus of this analysis is to address the impacts which, individually or in the aggregate, may be regionally significant.” See Master Response A.3 regarding level of specific
- F-S11: This comment does not raise environmental issues that require a response under CEQA.

F-T James B. Walsh

- F-T1: This EIR analyzes environmental impacts created at a regional level as a result of the proposed Plan. Global population issues are beyond the scope of the EIR.
- F-T2: MTC and ABAG followed CEQA requirements for public noticing of the EIR. See Chapter 1.2 of the Draft EIR for a description of the public participation process for development of the proposed Plan. Regarding public engagement for the EIR, please see Chapter 1.1 of the Draft EIR for a description of the Notice of Preparation and public scoping process and Chapter 1 of this Final EIR for a description of the public review process for the Draft EIR. Chapter 4 of the Draft EIR includes a list of preparers. The remainder of the comment does not raise environmental issues that require a response under CEQA.

F-U Nathan Daniel Stout

F-U1: Commenter's opposition to the proposed Plan is acknowledged.

F-V Michael J. Hayes

F-V1: The proposed Plan is not the cause of the projected population growth, but rather seeks to accommodate it, as required under SB 375. See Master Response B.1 regarding population projections.

F-W Roger Delaware

F-W1: This comment does not raise environmental issues that require a response under CEQA.

F-X Adam Kirshenbaum

F-X1: Commenter's support for the proposed Plan is acknowledged.
